MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, JULY 1, 1882.

VOLUME XLV Number 1

Draining and Irrigating Machinery.

We illustrate herewith one of the San Francisco Tool Company's turbine pumps, such as was erected last summer for lifting the sewage and surface water at the city of Sacramento. The engraving is in true elevation, giving front and side views of what the makers call a 200-inch pump. These pumps, as we have before explained, differ materially from those made in Europe for similar purposes. Instead of the runner filling or fitting the casing at the sides, a wide annular space is left so as to reduce water friction. The runner itself is constructed similarly to a turbine water-wheel, and being enclosed, as it is called, there is no friction in the interior, except that of the water passing from the center outward through the vents. These are curved to suit the conditions of the hight to which the water is to be lifted and the rate of duty required. The pumps are set vertical for both draining and irrigating, so as not to be affected by variations of the head to be drawn from. The belts, engine and other details are placed two feet or more above the driving pulley at *A*, and eight feet or more above the base of the pump, and 10 to 12 ft. above the supply level. The pumps work equally well when submerged, so that the machinery is not likely to be flooded.

The bearings of the pump are of phosphor bronze, the spindles of steel, and the pumps being vertical, with all bearings above the water, there is none of that rapid wear so common with horizontal pumps. The weight and vertical thrust are taken up on two radial bearings, with steel collars between. There is no packing gland on the main spindle, the joint being formed by a thrust collar.

The priming pipe, *C*, is connected with a tank, and also with the boiler feed-pump, so the pump casing can be filled at starting. The suction pipe at *C* has an area of 200 inches, and is fitted with a double wing-valve at the bottom.

The efficiency attained by these pumps for lifts of 20 ft., or less, exceeds that of piston pumps, while their cost is not more than one-fourth as much. The motion being rotary, there is no vibration, and expensive foundations are avoided. The San Francisco Tool company is now preparing plans for a plant of machinery to be erected on Rough-and-Ready island, on the San Joaquin river. The pumps, three in number, will have an aggregate capacity of 25,000,000 gallons per diem, working under ordinary conditions and employing from 80 to 100-horse power. There will be two engines, either of which can be used to drive one, two or three pumps at will and as the head may require.

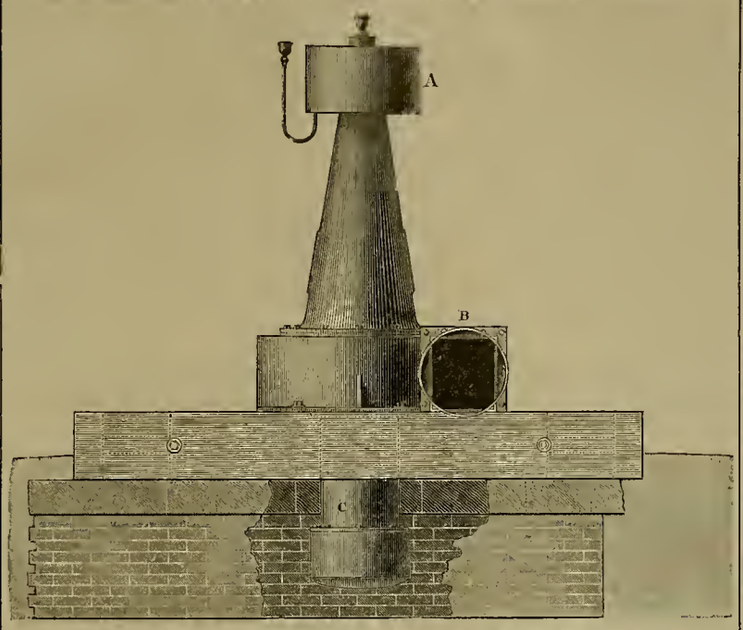
We have, in previous numbers of the MINING and SCIENTIFIC PRESS, given some comments respecting the raising of water for draining and irrigating purposes in the United States. With a few trivial exceptions, this problem is confined to the Pacific coast. The long drouth of our summers and the low level of river deltas demand irrigation and drainage.

The method of raising water applicable to mines, however well understood, is not at all adapted for draining and irrigating, except in cases when only a small quantity of water is to be dealt with, and we look with interest for further facts relating to the method we have just described.

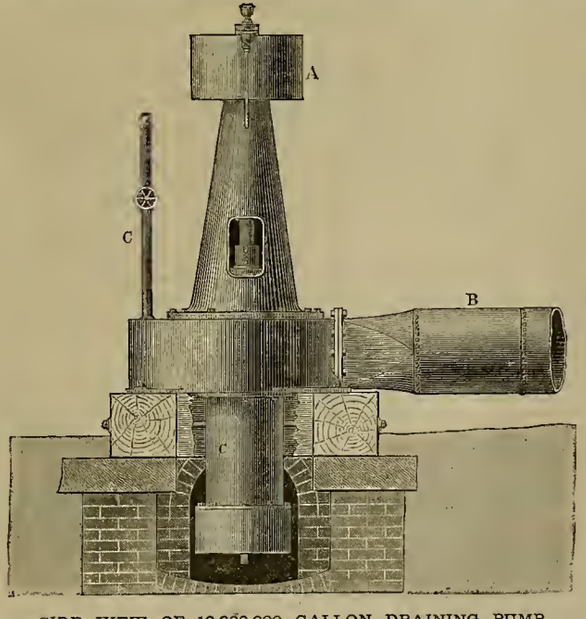
The ordinary centrifugal pumps of commerce are not adapted to such duty. If one will take the trouble to compute the flow area and pressures pertaining to a common centrifugal pump, or rather to their rated performance, it will be seen in some cases that the pressure required to drive the water through the pipes without lifting it would equal a duty of raising it 50 ft. Here is where the English makers of centrifugal pumping machinery have made their principal improvements in enlarging all water ducts and making the curves as straight and continuous as possible.

In respect to crooked courses and agitation, Mr. J. R. Maxwell, of the firm of Cope & Maxwell, the well-known hydraulic engineers, once made a remark that covers the whole ground. Mr. Maxwell was called to examine what is called Shaw's propeller pump. He looked at the pump, and then remarked in his peculiar, deliberate way, that, "so far as his experience went, it cost enough to lift water, without churning it into foam, especially as the latter operation consumed more power than the lifting."

In this matter lies another principle to be carefully considered—the agitation of water, either by the action of pump vanes or tortuous courses; applicable alike to pumps of all kinds, especially centrifugal pumps.



FRONT VIEW OF TURBINE DRAINING AND IRRIGATING PUMP.



SIDE VIEW OF 10,000,000 GALLON DRAINING PUMP.

In May, Evening Star (Leadville) produced $118,406, making a total of $642,520 since January 1st, and Morning Star (Leadville), $78,000, or a total of $333,126 since January 1st.

Gold Hill Miners' Union.—At a meeting of the Gold Hill Miners' Union the following officers were elected to serve for the ensuing six months: President, D. A. Curran; Vice-President, James H. McDonald; Recording Secretary, James Butterfly; Financial Secretary (re-elected), Thomas E. Burke; Treasurer, James Quick; Conductor, D. H. Vaughan; Warden, John Sullivan. Finance Committee—John Maginnis, Thomas O'Brien and M. E. Buckley. Trustees—Thomas S. Stevens, Ed. Doherty, Thos. Riley, Patrick Sheridan and John Judecka.

Sixteen thousand men are now employed in railroad construction in Florida. Eighty thousand people have settled in the State in the past 10 years.

Measuring Air Currents in Mines.

Some time since a special commission was appointed by the French government to consider the best means of preventing mine accidents arising from fire-damp. This commission has just brought its labors to a close, and has addressed to the Minister of Public Works a full report, in which the whole subject is treated. In the course of this they give some practical results in the matter of mine ventilation which are useful to the mining community.

For controlling the ventilation of mines, the commission has obtained excellent results with two appliances. The first, almost childish in its simplicity, consists simply of a sheet of ordinary letter paper, the upper part of which is held between two horizontal metallic clips. The air current strikes it towards the top and causes it to deviate from the vertical, the lower portion of the sheet moving through a quarter of a circle roughly divided; and the deviation increases with the speed of the air current. The indications thus afforded are only approximate, but sufficient for practical purposes. The second appliance, due to M. Bourdon, and which may easily be made self-registering, permits of readily measuring speeds, especially when they are high, and thus lends itself to regulating the speed of ventilators. It consists of a series of trunco-conical tubes arranged concentrically one within another, with a certain distance between; and the more numerous they are the greater is the sensitiveness. They are placed in the air current, the smaller diameter being turned towards its direction; and each tube exerts the effect of a trunco-conical ajutage, increasing the speed of the air in the reduced section. It thus happens that the speed in the section of the inner tube exceeds that of the general current. The difference between the general highs of the two currents is measured by causing to communicate, by means of india-rubber tubes, the upper portions of the two columns of a water gauge; on the one hand with an orifice receiving the impact of the air current passing through the narrowed portion of the inner trunco-conical tube, and, on the other hand, with a second orifice receiving the impact of the air on its leaving the apparatus. This appliance has given excellent results. A Belgian engineer, M. Cornet, is of opinion that high winds may exert, at the mouth of the up-cast shaft, a pressure capable of considerably modifying the circulation of the air in the mine. It would appear that this phenomenon only occurs exceptionally and during a very short space of time; besides, the change of pressure, due to gusts of wind does not exceed that corresponding to a few centimeters of water.

Idaho at the Exhibition.—Hon. T. F. Singiser, of Boise City, Idaho, has consented to act as Commissioner for Idaho Territory, to take charge of the Territorial exhibit. Gov. Neil, who appoints him, suggests that in each county or mining district an agent be selected by the citizens to collect specimens, etc., for exhibition. In this way a full showing of our wonderful resources, especially of the precious metals, can be made. The Governor says: "If a good showing can be made at the Denver exposition of our mineral resources, it will be of incalculable benefit to the Territory. Let an earnest effort be made everywhere in the Territory to have Idaho properly represented at Denver. There is no fund provided to defray the expenses of such exhibition, but I believe the next Legislature will cheerfully appropriate a sum sufficient to pay all necessary expenses incurred. An account should, therefore, be kept by each person having charge of a district of the expenses incurred in collecting and shipping articles intended for the exhibition."

Hon. John Hailey, superintendent of the Utah, Idaho and Oregon stage lines, has kindly agreed to deliver all articles intended for the Denver exhibition at the railroads, wherever the lines of the company reach the same, without expense to the shippers.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Quartz Mining in California.

EDITORS PRESS:—The subject of quartz mining, or of eliminating the precioue metals from the abundant quartz veins in California, must be of great interest to many of your readers. Past experience in this direction has not, as a rule, been successful; indeed, the idle mills scattered over the country bear testimony to the fact that quartz mining has been extremely hazardous, generally entailing a loss on those who ventured to put their money into it. It would seem that no, or at least very few, quartz veins bearing gold sufficient to pay are, or have been, large enough in supply to justify a plant sufficiently extensive and thorough enough to crush the ore and eliminate the precious metals at the minimum cost. Ores that carry from four dollars and upwards to the ton are, in some localities, very abundant; but to make such ores, those carrying only five dollars to the ton, profitable, the plant should be extensive and thorough, capable of handling from 100 to 300 tons per day, and at a cost not to exceed 50 cents per ton, which, with a water-power mill, with all the necessary shops and machinery, can be done.

Now, the next question is

The Ore Supply.

Here let the experience of early pioneers in the iron business in the East be considered. Many persons invested their money in furnaces in western Pennsylvania before the advent of railroads, and dependent on the ore supply from a single mine, and almost invariably lost their money. Before the plant was paid for the mine was worked out; but when railroads were brought into play proper and suitable localities were selected for the furnaces, where the work of smelting could be most cheaply done, having the railroads to concentrate at a low freight tariff the ores to the furnaces, and what has been the result? Iron men are proverbially the solid financial men of the country.

Now, Mr. Editor, without assuming to know much about the art of mining or crushing ores, I will venture to suggest what would seem to be foreshadowed in the preceding, not that it is wholly new, but under the firm belief that

Where the Plant is Properly Located,

As it may be in many places, it will form a great and durable success, not subject to great fluctuations, but yielding a constant income sufficiently large to be at once healthy and sure of a lasting future—a great want in mining enterprises heretofore.

Take, for instance, the neighborhood of Hornitos, Mariposa county, or a little east of it. Here you will find a rich deposit of gold-bearing quartz in limitless quantities, full of rich sulphurets, besides much free gold. M. Hulings & Co.'s mill (30 stamps) is a steam mill, using as fuel wood that costs $6 per cord, with no means of saving the sulphurets, yet we know the mill is doing well. Now, to continue: Group these mines under one management, construct a narrow-gauge railroad, by which transport their ores to the Merced river, where an abundant supply of water for power and all other purposes can be had cheaply; put up a 100-stamp mill, with a complete plant, to save all the precious metal in the ore, or as nearly as skill can do. Let the company put up a suitable foundry and shops, so that the works can be run and the gold extracted at the lowest possible cost, under circumstances the most favorable, and it cannot fail to be a success. As to the supply of ore that will richly pay under such

A System Properly Carried out.

A little acquaintanceship with the locality under consideration will satisfy any person competent to judge of such matters. Then, with this system commenced, as prospecting would go on further back in the foothills, finding new and perhaps even richer veins, all that would be necessary would be to extend the road, and thus a limitless field would be opened to the enterprise, and stamps could be added to make it large enough for the most ambitious operator. The scheme could be carried out under a stock company, copartnership or by a co-operative system, the essential element of success being the highest perfection in extracting the gold with the least cost.

I will here venture a few figures, based, as I believe, on reliable data, showing rather under than above the results that might fairly be expected from such a scheme, carried out with reasonable skill and ability. We will assume, as before stated, that ores that will yield from $5 to $50 per ton are here abundant. (M. Hulings & Co.'s mill has been crushing ores from their ledges that, by their books last month, averaged, in free gold, $13.57 per ton.) But say the ores will yield an average, counting sulphurets, of $6. A 100 stamp mill will crush 175 tons, which, at $6 per ton, will yield $1,050. Cost of mining ($1.50 per ton), $262.50; cost of transporting by rail (6 miles, 25 cents per ton), $43.75; cost of crushing (50 cents per ton), $75; contingences per day, $25; total cost of working 175 tons, $406.25, leaving a daily profit of $643.75.

Now, this is not an extravagant estimate, for there are few of these ores that will not yield much more than six dollars per ton from the sulphurets alone, besides the free gold. There is no doubt in the mind of the writer that the net profit of each a mill would be twice that amount per day much of the time, and then it would have what nearly all the mining schemes have hitherto lacked—a substantial future, based on the flow of water and a limitless field of ores.

In this

Feverous Age of Business Excitement

And haste to get rich, this scheme of moderate profits may not be favorably looked upon; but, after all, it is the sure and slow method in the long run; and I submit that, though my scheme may be only partially blocked out, that some such system must be adopted before mining can be successfully carried out in California, and those even and sure results realized, so desirable to all healthy enterprises.

These suggestions are not offered to the thoughtful as new. Doubtless many have entertained substantially the same views, and in some places they have been partially put in practice, but they are offered with the hope that they may ere long be put into successful practice in the locality instanced, with results that may not only be useful to the owners and to the county of Mariposa, but an example to be profitably followed by other similar localities.

C. C.

Mexico as a Mining Field.

EDITORS PRESS:—It may be interesting at the present time, when so many mining men are looking toward Mexico as the coming country, to consider its situation as regards the class of miners who should come here.

1. It is no country for poor prospectors, for the reasons that it is already thoroughly prospected, and while it can never be said of any mineral-bearing country that all its wealth is known, yet it is clear that a prospector's chances of a good find are greater in a new and unprospected mineral country; and in the event of discovering a fairly rich vein, his opportunities for selling it, or securing assistance to work it, are much greater in the United States than in Mexico.

2. It is no country for miners without capital, for the reason that native miners work for from 50 cents to $1.50 per day, which is certainly no great inducement to a good American miner; and the experience of many good miners who have come here, secured a fair mine and set to work on it, is this: Having exhausted their own capital, they found it extremely difficult, and more, usually impossible, to procure any assistance to carry their enterprise through to success. The absence of custom mills, or of any established market for ores, increases the difficulties referred to; and as the mining laws of the country require at least eight months' work of four men annually on each mining claim to hold it, it is clear that a poor miner, without capital to erect his own mills or furnaces, and without a market for his ores, cannot possibly comply.

3. But it is *the* country for mining men possessed of capital to open their mines and erect mills or furnaces, for the reasons that *proved* mines of merit can be bought for much less prices than are asked for mere prospect holes in the United States; that labor and supplies are cheaper here, and the prices realized for silver bullion at the mints here are greater than in the United States; that mining titles, person and property are infinitely more secure here than in the mining districts of the United States, while the mild climate (neither too hot in summer nor too cold in winter to work out doors every day, and all day,) promotes health and vigor, both of body and mind. Mining men, or associations of such, possessed of the requisite capital, can buy for moderate prices really excellent mines, or can make advantageous contracts with mine owners for ores, or for interests in mines, against machinery to work the ores. This last is a very good way for Americans to operate here, they contracting to erect hoisting works, pumps, stamp mills or furnaces, in connection with such mines as they approve of, the mine owner deeding them an agreed interest in the mines, and they deeding him an interest in the mill, etc., and then all operated as a joint enterprise. In this way they secure the knowledge and influence of the mine owner in favor of the business.

The Mexican Central railroad, now building from El Paso, Texas, to the city of Mexico, is fast opening up this section to American enterprise. Already there are four American companies, each owning a stamp mill here; another company is now erecting furnaces to smelt 100 tons of ore daily, while to the south, in the neighboring State of Durango, there is an American gold-washing enterprise at El Oro; two companies are erecting stamp mills at Indie, for Carmen; an American company left here last week to commence erecting a 40-stamp mill; a Canadian company is now en route with a 40-stamp mill for Guanacevi, while two American companies are negotiating with mine owners there for the erection of 100 stamps. The ores of the Guanacevi district are free milling, and there are enough mines now opened to depths of from 100 to 300 ft. to furnish ores for 500 stamps, of quality from 50 ozs. and upwards per ton. All its ores for the last 100 years have been worked in arastras, and the present average yield of all the ores so worked is over 70 ozs. of silver per ton, while the cost of mining, hauling from mine to hacienda, and there beneficiating by arastras and patio, averages under $30 per ton. With improved American machinery and processes, this cost could be reduced to from $15 to $18 per ton. With several of the best mines in the district, favorable contracts for the erection of mills could still be arranged.

GEORGE WILSON, Mining Engineer.
Parral, State of Chihuahua, Mexico.

The United States Mining Laws.

EDITORS PRESS:—In your issue of June 3, 1882, appears an article under the *nom de plume* of "A Prospecter." As the gentleman was not sufficiently informed, permit me, through your columns, to correct his inadvertent (?) errors.

My letter to which reference is made was first put in shape at the request of Mr. E. A. Kennedy, in November, 1880. Mr. Kennedy was then in Tombstone as a special census agent, gathering mining statistics. For him I wrote a letter (over my own signature) embodying my views, as published in the *Engineering and Mining Journal* of May 13th, 1882. The letter was forwarded to a representative Senator from the Pacific coast, who, as Mr. Kennedy subsequently informed me, expressed himself very favorably regarding what I had written.

I recently concluded to re-write the article and submit it to the *Engineering and Mining Journal*, and personally requested Mr. J. A. Church to comment upon it. I said to Mr. Church at the time, "I do not anticipate that everyone will share my views; but a change is needed, and unless some one takes the first step, nothing will be done."

Had Mr. "A Prospector" carefully read the letter he comments upon, he would have seen that the suggestions were limited to the laws governing locating, assessment work and patents; otherwise, no comment was directly made on the present mining laws—even inferentially the question of end lines was not touched.

I am not the agent of a corporation, and the views expressed by myself have been advanced after observing the disastrous effects, in many cases, of the present mining laws, as regards locating and holding claims. I have interviewed many prospectors regarding the changes such as I have suggested. I have yet to find the prospecter who, when he fully understood my views, did not heartily endorse them. Had only the subject-matter of my letter been discussed, I should have had nothing to say; but when an endeavor is made to hit a third party over my shoulder, and at the same time discuss the merits of a lawsuit extraneous to the subject, I am compelled to answer, that others, who are willing to candidly consider the subject and give their views, may not be deterred from so doing, thinking that they are aiding a corporation to gain a specific point, which, as I have before stated, is not the case.

The animus of the article is fully apparent. An individual, evidently not having carefully read the letters he criticises, ashamed and afraid to write under his own name, takes advantage of the communications of Mr. Church and myself to vent a petty personal spite, and discuss matters entirely irrelevant and immaterial to the point at issue.

ELBERT C. VAN BLARCOM.
Tombstone, June 9, 1882.

PAYMENT FOR INJURIES IN A MINE.—The most important civil case during the last term of the Second District Court, says the Silver Reef *Miner*, was that of James F. Muldoon vs. the Horn Silver mining company. This is a case wherein the plaintiff sued the defendants for the sum of $10,000 damages, for injuries received by him on Oct. 10, 1881, while in the employ of said company. The evidence disclosed the fact that while the plaintiff was at work some 25 or 30 ft. below the 400 level, the cage loaded with timbers descended, and without notice or warning being given, caught plaintiff in such a manner as to cut his neck badly and otherwise injuring him in such a way as to render him an invalid for life. The above statement of facts was clearly proven by the plaintiff. The defense relied on a well-known rule of law in such cases, that an employer is not responsible to a servant for injuries caused by a fellow servant engaged in the same common employment, and also that plaintiff himself contributed to the negligence which caused the injuries. The case was watched with great interest, it being the first one of the kind in this district. The arguments to the jury lasted nearly a day and a half, the attorneys for the plaintiff occupying about two-thirds of the time. The case went to the jury at 5 o'clock P. M. Thursday, who, after deliberating three hours, brought in a verdict of $10,000—the full amount claimed. Argument for a new trial will be heard in September.

ARTIFICIAL LEATHER.—This new article seems to be gaining public favor and is coming into quite general use. It is now suggested for buggy tops and for upholstering purposes, where leather is used. The artificial leather has the advantage of being much more impervious to water than the genuine article, while it will wear longer and looks better. It is said to be so good an imitation that excellent judges are often deceived by it.

Southern California Mines.

The following we take from the Los Angeles *Commercial:* A few years ago it was stated that there were no permanent or profitable mines in Southern California, and mining capital was turned away to the Territories. But, within the past two years, a more intelligent prospecting has shown that Southern California is one vast mineral region. Turn whichever way you will towards the mountains, and you find traces of minerals on every hand.

At first, placer mining for gold was carried on profitably for 25 years before people began to realize that silver was the prevailing metal of value. Although the placers still yield gold, and may be made to yield ten fold more by bringing water to the placers in the north part of Los Angeles county and to Holcomb valley, still the great discoveries are silver, and are beginning to attract attention from capitalists at home and abroad.

Yesterday the report reached us that the King mine was sold for $300,000 to parties in San Francisco. The King was owned by Messrs. John King, Hene. Thomas, Tom Warden, Geo. Yager and Frank Meacham, of San Bernardino. A hundred thousand dollars was paid, cash down, and a contract made to pay $200,000 from the first bullion proceeds of the mine, the purchasers to pay all expense of mining and milling the ore.

At present the ore is hauled 40 miles to the fine mill of the Oro Grande company to be reduced, but the new owners of the King mine agree to erect a 20-stamp mill inside of 60 days. A large well is being sunk in the vicinity, from which water will be carried up to the mill, which is to be close to the mine.

This sale will infuse new energy and activity in the Calico district, and add a large force of men to the camp. A new hotel is to be erected at Calico, to cost $10,000. Frank Rickey has purchased a lot on which he will establish a boarding house and saloon.

Other sales of mines are pending in this locality, and prospectors are all the time on the track of new discoveries. What is now needed is a water company to supply the camp with water from the Mojave river.

The Providence mountain, Trojan district, about 140 miles east of Calico, is another great centre of attraction and interest. In this camp are now over 100 men busily and profitably at work. The great mine, as far as developed, appears to be

The Bonanza King Con. Company,

Under the management of that prince of miners, Mr. Gillette. The ore that is now being taken from the three shafts of this mine averages a yield of about $400 per ton. Mr. R. Nadeau is now engaged in transporting hoisting works and a 10 stamp mill from Mojave station to this camp. The mill is one of Prescott, Scott & Co.'s best, and will begin its silvery work sometime in August.

It is reported that there is enough rich ore already on the dump to supply a 10-stamp mill for a year. A large hotel building has been prepared in San Bernardino, and will be carried ready-made to this camp and set up with all possible speed.

It will be remembered that two-thirds of this great mine was purchased recently for $425,000 of Messrs. Osborne, Haseen, Boyer and Drew.

The Sales of Mines

Recently made in San Bernardino county alone will amount to nearly a million of dollars. In the Slate range, in the north part of that county, a mine has just been sold for $20,000. It was owned at Newhall, Los Angeles county, mainly. The ore is gold, with some silver.

We may expect other great discoveries soon, from the long prospecting trip of Andy McFarlane, Doctor Drew, U. W. Pearce and Mart Anderson. These veteran prospectors have now been about six weeks out, and have made a large circuit, starting out about 40 miles east of San Bernardino and passing through the mountains northeasterly towards the Needles. When last heard from they were in the Providence mountains still marching on.

The Pinacate mines are doing well. About 20 arastras and a five-stamp mill are at work in these gold mines, which are in San Diego county, about 20 miles from Riverside.

The Eagle Mountain and Oro Blanco districts, east of San Bernardino, are showing some great discoveries of gold, copper, silver and iron.

The Oro Grande mill is now running on Calico ore with great success, under the management of E. P. Johnson, a veteran miller.

The Sanchez and Soledad gold and silver mining companies are about ready to start up their furnace on the Mojave and run out lead and silver bullion in abundance. Numerous other districts and mines are worthy of special mention, and will be considered hereafter.

THE LICK TELESCOPE.—The large flint-glass disk which has been cast in Paris for the Lick observatory, San Francisco, and which the Clarks, at Cambridge, Mass., will polish, is 38.34 inches in diameter, 21.65 inches thick, and weighs 375 lbs. The casting took place in four days and the cooling took 30 days. The crown glass has been cast, and will be shipped to Boston after it has become cooled.

THE Copper Queen, Bisbee, A. T., sold as a prospect for $4,200. The next sale was for $18,000. A smelter with development sold it next time for $1,200,000. The market value of the stock is now $1,900,000.

MECHANICAL PROGRESS.

Circumferential Calipering.

A writer in the Boston *Journal of Commerce* calls attention to the need of a more exact way of determining true diameters and the variations of lathe-turned cylindrical surfaces. That paper says: "The calipers, the beam-gauge and the fixed gauge are instruments that measure diameters by touching on opposite sides of a cylinder. No mechanic assumes that his sight is of the slightest use to him in this measurement; it is done entirely by feeling. Now, it is a fact that the sense of feeling, for mechanical purposes, must be educated; no uneducated man can possibly feel the touch of the two jaws of the calipers or gauge on the two sides of a shaft or stud twice alike. If he uses the calipers, or any yielding gauge, he will barely touch the points at one time, and spring them over at another time—and these "times" need not be more than a few minutes apart. Any excitement, even that produced by thought, will be sufficient to upset his equilibrium of touch. So, also, if the gauge is a rigid one, as a beam-gauge, or a fixed gauge, he is liable to "bear down" at one time and "hold up" at another time; and this liability is increased by the desire to make "almost" be "quite." (All young mechanics will understand this desire.)

But, even when the touch of the mechanic is educated, so as to caliper the same at any and all times, his touch is no guide for the feeling of another; and, where one would caliper right, another would caliper small, and another large. And, beside all these elements of inaccuracy and contingencies of error, the fact is added that, at the best, these calipering contrivances touch the cylinder at only two opposite points, measuring the diameter only, and at but two points, whereas, if the cylinder is not exactly circular in cross section, or round, the measurement may be quite incorrect.

The *Journal* suggests, as a more perfect way of determining the proportionate sizes of cylinders as compared one with another, or one portion with another portion, the use of a metallic tape to pass around, and to be used on the entire circumference instead of at two points, only, on the diameter. It is evident that if the measurement of a cylinder can be got from its entire circumference, it has three times as much probability of being correct as if taken from the diameter, as the circumference is three times greater than the diameter.

The tape might be made of soft copper, about one-eighth of an inch wide. In using this device, if passed around the shaft or object to be gauged, the two ends made to pass each other, and a mark drawn across both at the point of meeting, it is evident that the distance between the two marks must be the exact circumference of the shaft.

With this implement, the sight alone is required; and whatever of variation there may be in the visual organs of different persons as to the capability of determining colors and detecting shades, there is none in the power of determining whether two lines form one continuous line. And this is all that is required of the mechanic who uses this device.

NEW WAY TO MAKE BARRELS.—A Washington Territory newspaper says: The logging camp of the Mattnlath Manufacturing company is located at Carson, half a mile from Puyallup. They are getting out 20,000 ft. of cottonwood logs per day, using the labor of 17 men and four yoke of cattle. These logs are made into rafts and towed to the factory of the company at Seattle. The company thinks it has a great improvement in the sheet barrel, which is made by cutting a log into barrel lengths, softening them by a steam process and then shaving each piece into a long sheet, unrolled like a carpet. Each sheet is then crosscut into such a length that when the two ends are brought together it is given the size and form of a barrel without heads, the whole being done by machinery. This has been proved a great improvement over the stave barrel in cost of manufacturing, as well as in merits for use. The only drawback, if drawback it may be called, is that clear timber is required in this case, all the knotty timber being rejected; whereas, for staves knotty timber may be used. Consequently, the best of the cottonwood is now being culled out, and unless the supply of virgin forests of this kind proves illimitable, they will, after awhile, be compelled to return to the manufacture of staves exclusively.

HODSON'S HIGH SPEED ROTARY ENGINE.—One of the many objects of interest at the Crystal Palace electrical exhibition, London, was Hodson's high-speed rotary engine, which has been used, in several instances, to drive dynamo machines. The cylinder is divided lengthways by a diaphragm, two piston cams being feather-keyed on the shaft, one on each side of the diaphragm. These pistons are placed on the shaft in opposite positions to each other, by which arrangement the engine is perfectly balanced, and when the steam is exerting full power upon the one, the other is open to the exhaust. An abutment valve fits into a recess in the cylinder, the tail of the valve resting on the cam and rising and falling as the piston rotates. The pressure of the steam on the top of the valve insures its tight working, and a cushion of steam prevents it from striking the top of the cylinder. A steam port is situated on each side of the diaphragm above mentioned, admitting the working fluid to the two pistons by an oscillating valve, which is worked by an eccentric on the shaft. One of the important features of the engine is an absence of other than metallic packings, and the high speed developed renders it eminently suited for driving dynamo machines, for which purpose it is employed by several electric light companies.

COVERING LOCOMOTIVE BOILERS WITH KAOLIN.—A new use for kaolin has recently been devised. F. J. Cochrane, Master of Machinery on the South Carolina railroad, has solidly covered thirty locomotive boilers with kaolin. The cement is prepared by mixing two parts of kaolin and one part plaster of Paris in water, with jute fiber instead of hair, which is spoiled by the heat. The fiber is obtained by cutting jute bagging in pieces about two inches square and picking it in pieces. As the cement sets very quickly after the plaster of Paris is added, it should be used soon after it is mixed. The kaolin is first broken up and softened in water and the juts fiber mixed with it; then it is put up in barrels and kept till used. The cement is spread on the boiler in two coats, three-fourths of an inch thick, with a trowel. The first coat is left with a very rough surface, and is thoroughly dried and then cooled down before the second coat is applied. This coat is finished smooth, and to make a uniform thickness of cement on the boiler a straight edge and a half circle of the right size are used, resting upon strips at the top and bottom of the boiler. Each coat is dried slowly by filling the boiler with water and heating it to boiling point. A greater heat is prevented by keeping the safety-valve open. If it is made hotter than the boiling point, steam forms between cement and boiler and forces it off. The slower it dries the better it is. It takes about half a day to dry each coat. About three barrels of kaolin and one and a half barrels of plaster of Paris are used on an ordinary sized boiler.

RENEWING PAINT WITHOUT BURNING IT OFF.—The apparent cracking of paint on cars is frequently the cracking of the varnish only. When this is the case, the car can be prepared for repainting by going over the surface with a sponge wet in strong ammonia and then scraping off the varnish with the wide square end of a spatula in two or three minutes after the ammonia is applied and before it is dry. This removes the first coat of varnish. If it is desired to remove another coat, it can be done by going over it again with the ammonia and following with the spatula. When the last coat to be removed is taken off, follow immediately with a plentiful washing with water to kill the ammonia, after which a little rubbing with pulverized pumice stone will give a smooth surface, which can be built upon with new coats of paint or varnish, as may be desired. The same method applies to cleaning the varnish from the veneers or solid woods of the inside finish. The car can be prepared for new coats in this way in one-fourth of the time necessary to scrape it down. When the car needs repainting after the varnish is removed, a light coat of lead is applied, then the car is putted where needed, and a No. 0 sandpaper gives it a smooth surface ready for the new color. A car can be got ready for this coat in two days with the work of three men; while it would take the same men over a week to burn off the old paint and give it a lead coat and rough-stuff it, and another week to rub it down. —*National Car-builder.*

A NEW BUSINESS.—There is a large planing and manufacturing establishment on Nineteenth street, N. Y., where a machine is run for the purpose of grinding shavings for horse bedding, packing, etc. This novel business has been initiated by an old lumberman of 40 years' experience, who some years ago invented a machine for grinding shavings. An experimental test produced the most gratifying results, and the experience after four years' use furnishes an important contrast to the facts before the plan was employed. Instead of paying some five dollars per day for the removal of the shavings, the above establishment now realizes a revenue therefrom of from $30 to $50 daily. The capacity of the mill is 10 tons per day, and the ground shavings find a ready market at six dollars per ton. The product of the mill, however, does not average the number of tons given as the daily capacity. There are some 80,000 horses in the city of New York, to say nothing of outside points, and if the use of the shavings for bedding was pushed, there is a wide field for operating. One of the advantages claimed for the shavings is the absorption, by the wood acids, of all odors; hence the shavings are used to some extent as a disinfectant, and decayed matter, when covered by them, is rendered unoffending. Ground shavings are also used for bedding cattle and swine, also in stock cars, and are held to be better than sawdust for icehouses.

TESTING PLANER KNIVES.—A set of new knives should be carefully tested to see that they are correctly balanced, and kept so. A knife slightly out of balance throws the cylinder out, makes rough work and wears the bearing. This, when once started, grows rapidly worse, and getting the knives back to balance does not remedy the matter. Both the spindle and boxes are brought to that state where a machinist's services are necessary to return and balance the cylinder.

SCIENTIFIC PROGRESS.

Interesting Experiments.

Mr. John Eitel, a chemist of Sacramento, contributes the following, among other matters, to the Sacramento *Record:* About 10 years ago, while taking plaster casts of frogs, previously knocked on the head, I made the discovery, after cutting out the frog from its plaster housing, that the animal had regained its former qualities of jumping, and was as good as new. Thinking that the frog was only stunned, another frog was treated as previously stated, and as a precautionary measure a knife having a sharp point was run through its head. In procuring a mold a wriggling frog is a disadvantage, and it is desirable that the subject used as a cast should be deprived of life entirely. On cutting out this second animal, to my surprise it also had fully recovered its strength, and this took place in five different sized frogs of which casts were taken. I came to the conclusion that an amphibious animal, like a frog, had a rather tenacious life, else plaster of Paris resuscitated them.

In the spring of 1878 I resided in the upper portion of this city, and found in the vicinity some very large-sized toads. I concluded to experiment further upon this ugly creature, which is known by the more intelligent as the gardener's friend. One of these fellows was placed under the receiver of an air-pump, and the air gradually exhausted, making in the meantime observations how greatly the toad would be astonished when finding itself gradually in a rarified atmosphere—or, in other words, inhaling less and less oxygen. When the mercury in the manometer showed that the air was almost pumped out—for entirely it cannot be in those pumps—the toad was noticed to breathe somewhat more rapidly, but otherwise showed no signs of being the least inconvenienced. To me it proved that an animal of that species can retain life on a very small quantity of oxygen; but to test the undertaking further, the animal was retained in its prison, the air being continually exhausted. It was found at the end of three or four days that no apparent injury was inflicted by the treatment the subject underwent.

Now, in order to see what difference there would be between a cold-blooded amphibious animal and a warm-blooded animal, a mouse was placed under the receiver. At the first stroke of the pump it showed great uneasiness, and at the third and fourth exhaustion it had ceased to live for want of air.

Another toad was next treated to electricity, applying first a very weak battery power, with a rather powerful induction coil. The toad was placed on a copper plate, in connection with one of the terminals of the coil; the end had a glass rod attached to the wire, and with the point of the wire the animal was touched at various parts of his anatomy. Wherever touched, instant contortions of the body took place, and after several contacts, a white matter or perspiration appeared on the skin, of which the odor was not of a quality that would remind one of "Araby the Blest" or the "Valley of the Roses." This may be one of its weapons, as the toad is not a very dangerous animal otherwise. The full battery power of two Bunson's cells in good order was then applied, and a touch of the wire stretched out the animal to the fullest extent, lifeless, and subsequent experiments by imbedding in plaster could not resuscitate it.

PHOTOGRAPHING THE SOLAR ECLIPSE.—M. Janssen took magnificent photographs of the recent eclipse at the Mendon Observatory, Paris, where his photographic revolver was set in operation to determine the first and the last contact. He also took two series of photographs ninety centimetres diameter, one negative and the other positive, by direct exposure, with two large refractors. This is the first time that the whole photographic power of the Meudon Observatory has been set in operation. In the sitting of May 22d of the Academy of Sciences, M. Janssen presented the photographs of the last contact obtained with his revolver during the eclipse on Daguerreotype plates. He stated that the inspection of the several images proved the contact to have taken place at a later time than that calculated. He presented, also, a large image, ninety centimetres in diameter, obtained with his large refractor, and stated that he was unable to detect any difference in the immediate vicinity of the moon in the representation of faculæ and the minute details of the sun's structure. He considered the fact to be opposed to the existence of a sensible lunar atmosphere, as inferred from the spectroscopic observations of the French astronomers in Egypt.

A REMARKABLE BLOCK OF AMBER.—Some fishermen of the Isle of Zuigst have fished up, opposite Stralsund, a piece of amber weighing more than eight lbs. It is nine and one-half inches long and five and one-half inches in circumference. It is a most remarkable piece of amber, having all the qualities which distinguish the rarest pieces, color dark yellow, shining like glass, and not transparent. It is rare that a piece of amber weighs a pound. The piece, which is preserved in the Museum of Natural History at Berlin, weighs about 14 lbs.

On the Formation and Structure of Coal.

It seems probable that vegetable matter may, under certain conditions, be converted into coal much more rapidly than many geologists have supposed. At least a notable instance of an approach toward such conversion has been lately found in one of the mines of the upper Hartz, Germany, some of the wood originally employed as timbering there having become so far altered as to assume most of the true characters of a lignite or brown coal. The fact, as stated in this connection, is that certain of the levels in the ancient workings of this mine are filled with refuse matter, consisting chiefly of fragments of clay slate, more or less saturated with mine water, and containing, here and there, remains of the old timbering. This wood, when in the mine, is wet and of a leathery subsistence, but, on exposure to the air, it rapidly hardens to a solid substance, having most, if not all the characters of a true lignite. It breaks with a well-marked conchoidal fracture, and the parts which are most altered present the black, lustrous appearance characteristic of the German pitch coals. At the same time, chemical examination of the altered wood shows that it stands actually nearer to true coal than do some of the younger tertiary lignites—a point which is of peculiar geological interest. Under all the circumstances, the case in question is believed to prove that pine wood, when placed under highly favorable conditions, may be converted into a genuine lignite within a period which, in view of all that is known of the history of mining in the Hartz region, cannot have extended beyond four centuries—a comparatively brief period when set against that commonly assigned to coal formations.

THE SUBDIVISION OF THE ELECTRIC LIGHT.—In a letter to the editor of the London *Times*, Mr. W. H. Preece, the well-known English electrician, says: There is a great confusion between the problem of the subdivision of the electric "light" and that of the distribution of the electric "current." They are two totally different questions, which are generally mistaken for each other. If a given current, say that equivalent to one-horse power, will give a light, say of 2,000 candles, you cannot by any known means divide that light into 20 lamps of 100-candle power each. The best that has hitherto been done from one-horse power is to obtain 8 lamps of 16-candle power each. You can, however, distribute the current in any way you please. If one-horse power will give you 1 lamp of 2,000-candle power, or 8 lamps of 16-candle power, it is evident that two-horse power will give you 2 lamps of 2,000 candle power, and 16 small lamps; three-horse power, three lamps of 2,000 candle power, or 24 small ones, and so on directly by multiplication and distribution. Mr. Brush has shown how to multiply his lamps, and Mr. Edison has shown how to distribute his currents and multiply his lights; but no one has as yet attempted to solve the question of the subdivision of the electric light. The largest machine yet made—that of Edison—will maintain 1,200 incandescent lamps, giving 16-candle power each, or a total light of 192,000 candles, with an expenditure of 150-horse power. Such a power applied directly to the production of light ought to give a light of many million candles.

GUM FROM ALGÆ.—A new method of utilizing marine plants has been devised in France. The plants used are various forms of Atlantic and Pacific algæ, and the product obtained is a gum said to be variously useful in the arts, particularly in the manufacture of leather substitute. The plants are first washed with warm or cold water, or both, the water either being pure or containing 10% alcohol, or any of the following substances: Lime water, carbonate of soda, potash, carbonate of magnesia, or baryta, according to the smaller or larger quantity of cellulose or salts contained in the algæ, which has to be precipitated. Before the extraction of the gum the plants may be dried, ground, broken, etc., according to their nature and according to the requirements. For the extraction of the gum hot water is preferred to cold, and steam to hot water. The extraction takes place in a conical vessel, the plants being placed on a false bottom, through which steam or water is made to pass through the mass. The quantity of water or steam used varies with the quality of the plants—15 to 20 times the weight of the plants will be the best proportion. To facilitate the action of the water for the extraction the plants are subjected to maceration. In order to obtain pure and transparent algæ gum, this must be diluted with much water; then it is left to settle, the temperature being kept at 50° to 60° C. The gum gelatinizes by cooling.

TREATING WINE WITH ELECTRICITY.—A curious experiment, according to the Paris newspapers, has recently been made with wine in that city. A current of electricity was passed through a small cask of sour wine, and at the end of a few days the wine was found to be greatly improved in quality, and to have acquired that flavor which has hitherto been supposed to come of age. It is said that the discovery of this new maturing process is owing to the accident of a thunderstorm having greatly improved a cask of bad wine in the cellars of a vintner at Carcassonne.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Stormont, June 20th, $5,415; Idahoan, 20th, $3,800; Horn Silver, 21st, $20,000; Germania, 21st, $2,000; Hanauer, 21st, $2,025; Germania, 22d, $4,200; Mayflower, 22d, $3,300; Horn Silver, 23d, $15,000; Frisco, 23d, $4,248; Horn Silver, 24th, $12,500; Hanauer, 24th, $2,125; Jay Gould, 24th, $3,490; Salt Lake City receipts for week ending June 23d were $114,426; Ontario, 23d, $65,574; Horn Silver, 25th, $10,000; Mammoth, 25th, $2,528; Germania, 25th, $3,000; Hanauer, 28th, $2,170.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

Bowlder Creek Water and M. Co., June 26. Location, Shasta Co. Capital stock, $10,000,000, divided into 100,000 shares. Directors—H. P. McNevin, Wm. T. Higgins, James Gannon, Patrick Crowley and Richard Chute.

Hornet M. Co., June 26. Location, Iron district, Shasta county. Capital stock, $10,000,000. Directors—H. P. McNevin, W. T. Higgins, James Gannon, Patrick Crowley and Richard Chute.

Copperopolis M. Co., June 26. Location, Arizona. Capital stock, $1,000 000. Directors—W. E. Hale, A. B. Hull, W. Alexander, R. C. Hasker, and J. Scott Wilson.

THE rumor that the Russian government intends to impose export duty on grain is denied.

MINING SHAREHOLDERS' DIRECTORY.

The Mining Share Market.

The stock market is without material change. Up on the Comstock, where the indications are looked for that rule the stock market, there is little to write. The *Enterprise* says that good progress is being made in sinking No. 1 winze on the 2700 level of the Mexican, but owing to the absence of Superintendent Patton, we have no information in regard to the present appearance of the ore.

The Savage folks are probing their ground, both on the 2200 and 2400 levels, with the diamond drill. They find a good deal of quartz, but as yet the drillings have shown no paying ore.

At last the water at the Yellow Jacket new shaft appears to have found its level. At the old Winter's shaft, Gold Hill, all is going on well, and it is expected that they will soon be hoisting milling ore. The old levels are now pretty well ventilated.

The Overman folks have commenced cleaning out the old upper tunnel, which starts in Gold Hill, about on the level of Petalnma street. Heretofore they have never been able to get into this old tunnel, but they will now use such means as cannot fail. Those who are acquainted with the ground at the end of it, which was worked in the early days, say there is a great deal of good ore that was left behind at various points, as it would not pay at that time, owing to the high prices charged for crushing.

RICH ORE FROM LUNING.—A considerable quantity of ore from Luning, Garfield district, goes through Reno daily for the Melrose smelting works, in Alameda county, Cal., says the *Gazette*. An agent of the reduction works is located at Luning for the purpose of purchasing ore from prospectors, according to its assay value, paying cash for all deliveries. This is a great advantage to miners, as it enables them to realize enough to "keep the pot boiling," so that they can prosecute the work of prospecting.

"THE MINE OR THE SUPERINTENDENT."—This was the title of an editorial in a recent number of the MINING AND SCIENTIFIC PRESS. It must have been a pretty good one, as it has been so well appreciated as to have been copied into a great many papers. Some six or eight have taken it into their own editorial columns, without any credit to its source. The PRESS feels complimented to have its articles reprinted, but it does not like to see them going the rounds credited to some other journals that have stolen them.

SINCE the first discovery of the mines of Austin mining district, in 1862, down to the present time, the aggregate bullion yield has been very large. The vast majority came from the mines on Lander hill, within the borders of Austin. The Manhattan mill is busily grinding out more bullion, and produces about $1,000,000 yearly.

WE see by the Placer *Argus* that M. Baker has a contract for hanling 1,000 tons of quartz howlders from the Polar Star mine to the railroad track above town. This quartz is to be used in the railroad iron works and shops at Sacramento. They are utilized in the smelting furnaces.

IT is said that the Yukon river, in Alaska, is navigable (when not frozen) a distance of 2,700 miles.

The Earthquake.

The severest earthquake which has visited the State since 1868 arrived on Tuesday morning at about half-past five. It frightened timid people, but did no bodily harm, as far as we have heard. The most interest in the event seems to have been manifested in San Jose, where hundreds of people rushed into the streets, many of them in their night toilets. The vibration of the earth was, apparently, from east to west, and lasted, with decreasing severity, during about 20 seconds. There was first a severe shock or jerk, followed by a rolling movement and then a gradual settling. In many parts of the city the buildings suffered more or less, the plaster being loosened and the walls cracked. The court house withstood the shock without any injury, but the walls of Welch's brick building, on First street, those of the Home Mutual Insurance Company, on Santa Clara street, the Normal School and others were more or less cracked. The Normal School suffered the worst, the walls being cracked in several places; in one place a cross section of the wall being separated entirely from the main wall running east and west. The building, however, is not damaged so as to render it unsafe. In other places, further west, the shock is reported as much more severe. In the Santa Cruz mountains reports come of broken windows and over-turned chimneys. One man reported the shock so severe where he was, in the mountains, as to throw him to the ground. No persons are reported injured.

The vibrations seem to have been more marked near the coast. At Stockton the shock was very slight.

FRASER & CHALMERS, the mining machinery men, have opened a business in Denver, at which place they will be pleased at all times to show plans and give estimates for all kinds of mining, smelting or milling machinery. They deal in Knowles & Blake pumps, Ingersoll rock drills and compressors, Leffel turbine wheels, Weston electric light, and all modern first-class machinery. They are also sole manufacturers on the Eastern slope for Frue vanning machines, Hallidie's endless automatic wire-rope tramway, Tulloch's automatic feeders, Huntingdon's California oscillating stamp mills, and Heald & Circo cheap, powerful and economical engines. They also manufacture improved Corliss engines, Cornish pumps and hoisting engines. Long water pipes and pump columns a specialty. Parties wishing to order can be waited on by a member of the house at a point where machinery is to be erected.

HOFMANN BROS., the well-known metallurgists and ore workers, will move from their present quarters at 415 Mission St., on July 15th, to better premises on the corner of Fifth and Bryant streets.

ENGINEER MELVILLE telegraphs from Ykaulski, under date of April 10th, as follows: I have searched the coast from the river Alanek to the river Jana, but have found no trace of the second cutter, or of Lieutenant Chipps' party. I have buried the remains of Lieutenant De Long, Dr. Ambler, Jerome Collins, also of seamen Lee, Garth, Dressler, Knack, Ivorsen and Boyd, and the Chinese servant, Ah Tom. I have secured every paper pertaining to the expedition. Seaman Ericksson and the Indian Alixia had already been buried on the river Lena. I am now en route to Irkontsk.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

BUNKER HILL.—Amador *Ledger*, June 24: It is pleasing to be able to state that this mine is looking better than it has done for some months past. Thirty stamps of the mill are now running, and the prospect is good for steady employment for that number of stamps for an indefinite time. Sinking an additional 100 ft was commenced on the new shaft in the early part of this week. This will give a total depth of 600 ft.

NEVADA.—The shaft is down over 40 ft. Everything pertaining to this prospecting venture has an air of stability and permanence, indicating the utmost confidence of the promoters in the existence of a paying mine there. The shaft is 5x8, and substantially timbered. A ledge of ribbon rock has already been encountered, several feet thick, and said by mining men who ought to know to be of good paying character. Carpenters are busy putting up hoisting words, to be run by a donkey engine. This machinery will enable the explorations for mineral to be prosecuted to a depth of over 300 ft.

SOUTH SPRING HILL.—The boiler for the new hoisting machinery is on the ground; the balance is at Knight's foundry, undergoing some needed repairs. Mechanics are to be engaged forthwith to construct the work. With this easy

tom of the incline. The machinery will probably start up the last of this week.

SAMUEL LOCK is in town looking after the interests of the Osceola Co., and has shipped rock from the mine to San Francisco to be tested. There is a probability that the Osceola will start up in a short time.

THE little bonanza, known as the Ford & Mullen claim, located on New York hill, still keeps up its lick in producing good milling ore and exceedingly rich specimen rock. Last week $820 worth of specimen from the Ford & Mullen was sold to jewelers. There are several boxes of specimens yet remaining in Judd's vault, and more are coming in every day or two.

THE Judd & Casey ground, on Ben Franklin hill, is being worked. The ledge has been struck, and about 4 loads taken from it for crushing.

A NEW location has been made on the south side of Deer creek, about two miles from Grass Valley. The claim is quartz, and is about 200 ft southerly from the mouth of the old Prospect M Co.'s tunnel (formerly known as the West Idaho). The new location will be known as the "Greeley-Blackman ledge," Mr. Horace Blackman, of Sacramento, being one of the principal locators. The gentlemen connected with the affair are very enthusiastic over the appearance of the rock from the ledge, and have several good-looking pieces on exhibition in town. The ledge is 4 ft thick.

PLACER.

RICH.—Placer *Argus*, June 24: Bentley Bruce, an Ophir mining man, has struck it very rich on the hill opposite the chlorination works, half a mile below Auburn. Some quartz rock taken from his shaft was on exhibition the other day at Andrews & Holtenbeck's. It showed large quantities of free gold. He had two sacks of the rock, which he estimated to be value for about $1,000. To give some clearer idea of what this rock was like, we will state that for a piece of quartz, weighing some 4 or 5 pounds, he was offered $20, but he refused to sell.

A RICH MINE.—Placer *Herald*, June 24: A. Shurtleff called at our office last Wednesday morning with a very rich specimen of quartz rock, taken from his mine in Duncan hill. This mine has long been known to be very rich, but the rock that is now being taken out, of which the piece shown us is a specimen, is richer in free gold than any before taken from the mine. This mine is located about two miles from Auburn. Some time since, Mr. Shurtleff drove a tunnel on the same mine from the east side of the hill. Since then he has been running a new tunnel from the west side, and is now in about 582 ft, and about 300 ft from the surface, perpendicular. It is from this tunnel that his rich rock is being taken. Notwithstanding the known richness of this mine, the rock now being taken out is of exceeding greater richness than any that the mine has hitherto yielded. Mr. Shurtleff has at different times had what some people thought to be very liberal offers for his mine, but, being satisfied with its exceeding richness, prefers to more fully develop it.

PLUMAS.

GOLD STRIPE MINE.—Oroeville *Bulletin*, June 25: In the Gold Stripe mine the ledge is now opened 150 ft in the first drift; on this length the vein has an average width of 4 ft and 125 ft of backs. From the face of the drift the ore is run out and dumped down a shaft to the main tunnel; from this tunnel a crosscut is now started that will again strike the ledge 160 feet below the upper workings, giving a total of 285 ft of backs. This crosscut will be about 125 ft long, if the dip of the ledge remains the same as in the upper levels. When the works were visited on last Friday, the mill had then been running 6½ days; the plates had hardly yet got in first rate order, but on applying the hose with clear water they appeared to be well covered with amalgam. The daily cleanups are improving with each day's run, and a few more days will put everything in good condition. The daily work of the mill is 40 tons of ore, crushed with 24 stamps, and the total number of men employed at the works is 22, including 2 engineers, 4 feeders, 1 amalgamator and 1 foreman. This shows that the ore is easy to mine and easy to mill; the present condition of the mine is very encouraging; from the first day after the latest start the yield from the plates alone would give a profit over all expenses.

SOUTHERN EUREKA MINE.—An inspection of this mine on Saturday discovered a marked improvement in the ledge where it is being drifted northward; this direction carries the workings deeper into the mountain, and as depth is gained the ledge becomes more solid, the walls are better defined, and the stopes are easier to keep. Ore was broken from the face of the drift in various places, and when carried outside and prospected each piece showed a good prospect. On the surface the ledge is easily traced from the present workings to the summit of the mountain, and down the north side; a tunnel could be easily run from this side that would tap the ledge at any required depth of from 500 to 1,000 ft, or more if desired. From such tunnel chutes would carry the ore into a mill placed below the Round Valley Water company's ditch, and this would furnish water and power for any amount of stamps that might be wanted. If the stockholders expect ever to get any profit from this mine, the above plan must be adopted; in proof of the truth of this assertion it need only be stated that on Saturday the pumps were found pumping back the water that had passed through the batteries to be used over again, and his, too, when the last of the snow has but lately gone from near the mine.

GREEN MOUNTAIN MINE.—The new rubbing machines will be in operation by the end of the week. Six will be put up at the lower mill and three at the upper mill. An arastra has been put to work inside the mill; this machine was found to run too fast when first started, but has now been geared down to the proper speed; it is only used for working over the tailings from blanket washings, and from the barrels where the pulp from the batteries is washed over after each general clean-up. In tunnel No. 5 the ledge is now 20 ft wide, and in all other parts of the mine the present outlook is very good. Last week Mr. Rogers let a contract for running tunnel No. 0 at $6 per ft; this is the cheapest work of the kind he has ever had done; the contract is for 100 ft. The reason why a greater length was not let is that there may not be anything in the way of using the power drills when they shall be received; with the use of these machines the above rates for tunneling will be reduced considerably. Putting in the rubbing machines and arastra will not call for much additional expense for labor. Mr. Rogers has already made trial of one rubbing machine for a number of months, and is quite satisfied that their use will prove a great economy.

MONITOR MINE.—After standing idle for two years, the Monitor mine was started up last week. During that long interval the machinery had got somewhat rusty from disuse, the plates especially were in an unlavorable condition, and in order to brighten them up and get them soft, such ore as was gathered in clearing the dump and the face of the drifts has been run through the mill. In the last day or two everything has been getting into proper working order, and from the present time only good ore will be milled. The ledge is capable of furnishing ore for six times the present milling capacity, so that care may be taken to select what will pay best, and is so easily worked that two men with picks now take out all that is needed. The mill is now crushing at the rate of two tons for each stamp. Mr. Compton, the superintendent, is confident that better results will be obtained by slower crushing, and when selected ore is being worked he will reduce the rate to about 1½ tons per stamp per day. The Monitor can from this time be confidently depended upon as one of the paying mines of the district.

SIERRA.

SIERRA CITY.—*Mountain Messenger*, June 24: The Haskol Peak Co. is sinking a shaft, and expect to find pay gravel down about 80 ft at bedrock. The Marguerite Quartz Co. is running, as usual, 10 stamps, employing 40 men. Appearances are favorable for good returns. Sierra Buttes tunnel, No. 9, is in 1,100 ft. J. Carney, head amalgamator at the mills, is now well and "on time," attending to his duties as usual. Blue Gravel Co. has its air shaft completed, and the atmosphere is excellent now for all working purposes. They are still driving the main tunnel ahead, now in 700 ft, in very hard bedrock. The Rainbow Co., Chips Flat, is getting out its timber for its quartz mill. Walter Lawry, superintendent of the Bald Mt. Ex mine, of Forest City, was in town Sunday. It is rumored that $75,000 has been obtained to prospect a block of claims east of Cornish ranch.

BALD MOUNTAIN EX. WORKS BURNED.—About 2 o'clock A. M. Thursday morning the works of the B. M. X., at Forest City, were discovered to be on fire, and in a short time the works at the mouth of the tunnel were in ashes. The company lost all its buildings, timbers, reservoir, two mules, several cars, tools, supplies, etc. Two men were at work in the mine at the time, but were notified and escaped through the shaft. Watson Bayles was the first one on the ground, but the fire was so far advanced that not a thing could be saved. The loss is about $6,000. We are without further particulars. The company will immediately repair the tracks and dumps and go ahead. The fire undoubtedly caught from the forge. There is no suspicion of its being incendiary. No insurance.

GEO. REYNOLDS, superintendent of the Four Hills mine, was in town this week. He is going to build a road to connect his mine with the outside world, and would prefer to connect by way of Sierra City and Downieville, but, if that cannot be done, he will connect with the Gibsonville road.

SAVAGE.—It is reported that the Savage Co.'s tunnel is through the granite and into mountain lava.

GOOD HOPE.—The Good Hope mill is pounding away on good rock. A raise in the mine has developed a fine chimney of good rock in quantities not heretofore known to exist.

TRINITY.

JOHNSON GRAVEL MINE.—Trinity *Journal*, June 24: We understand that the Johnson gravel property, at Indian creek, is about to be sold to Eastern parties. This mine has been one of the most regular bullion producers in the county, and will continue to produce for many years to come. Always large, its production will doubtless be largely increased under the new ownership, as the entire water supply will be utilized. The present water season has been fully three months short of the average.

NEVADA.

WASHOE DISTRICT.

OPHIR.—*Enterprise*, June 20: On the 2000 level, the main south lateral drift has been extended 20 ft. Are cutting out a station for the joint Mexican winze. Are extracting ore from the croppings.

UTAH.—The main east drift on the 2500 level has been extended 0 ft. Owing to the breaking of the pump gear, progress for the week has been a good deal interrupted. The break has been repaired, and all is now running smoothly.

CONSOLIDATED VIRGINIA.—On the 2700 level, joint California east drift No. 2 has been extended 21 ft, and the joint California west drift, on the same level, has been advanced 28 ft.

CALIFORNIA.—The extraction of ore from the old croppings is still continued.

SIERRA NEVADA.—The joint Union Consolidated west drift, on the 2900 level, has been advanced 11 ft. Have completed repairs to the winze between the 2300 and 2400 levels.

MEXICAN.—On the 2900 level, west crosscut No. 1 has been extended 11 ft. The work of cutting a station for the joint Ophir winze on this level is continued. During the week, 20 tons of ore were extracted on the 2700 level.

UNION CONSOLIDATED.—Are stoping out ore on the 2500 and 2600 levels. During the week there have been 705 tons and 1,800 pounds of ore extracted, and 009 tons and 170 pounds sent to the mills. Bullion shipped during the week $25 712 27.

YELLOW JACKET.—Since the last weekly report, the water in the mine has risen 18 inches, standing to-day about 441 feet above the 2300 station. At the Winters' shaft, the Sagebrush, or 100 level, has reached the switch in the quartz. Will replace the same, and work towards the south line. The west drift on the third level is passing through the old stope, and the east drift on the fifth level is also passing through the east stope. We find these old workings badly caved and the timbers crushed. Some of the filling gives fair assays.

BELMONT DISTRICT.

EMERSON MILL.—Belmont *Courier*, June 24: Everything moves along smoothly in the Emerson mill. Mr. Harries is meeting with success in leaching the roasted ores, and he expects to turn out a fine bar of bullion next week. Adams and Cabin mountains, and the hills immediately southwest of Hieroglyphic rock, this county, were visited by a terrific thunder and hail storm on last Sunday. Superintendent Fassett is having the water hoisted from the Belmont mine. There is a good supply of ore at the mill, and the work of repairing goes on satisfactorily. Mr. Emerson's mines continue to look well, and the work of development is being prosecuted with energy. Mr. Emerson had a number of men employed this week in burning limestones north of town.

BELMONT.—We are hoisting the water from the mine, having it to-night below the 300 level. The mill work drags some, but hope to be through with it in a few days. We have plenty of ore at the mill, and chute full, besides 100 tons ready to go into the chute.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, June 24: During the entire week very hard ground has been encountered on the fifth shaft level, on account of which the main drift has been extended only 14 ft, the face being distant from the station 223 ft. On Monday, the formation changed somewhat, blasting more easily; hence hopes are entertained that better progress will be made hereafter. The other shaft levels show no material change, but continue their usual yield. The levels above the adit look fully as promising as last week, particularly the eighth and ninth. In the eighth the ore has widened to fully 7 ft, showing an average grade of $50 to $55. In order to make connection with the ninth level, sinking in the ore has already been commenced. On the ninth level, the total distance run since the new discovery was made has been 85 ft, all the way in ore, which in the face of the drift is four ft wide and of very fine grade. Everything is running smoothly at the hoisting works, and all within the mine is progressing as usual. The railroad is delivering to the mill about 60 tons of ore daily. Mill No. 2 is running steadily, and doing good work. Bullion shipments for the week ending June 22d, $18 569.63; shipment on June account to the same date, $50 034.95.

MOUNT DIABLO.—The north crosscut from the bottom of winze No. 1 is in 16 ft, and shows more favorable ground in the face. The west drift is in 22 ft, and shows no change. Considerable ore has been stoped out from this ledge in winze No. 2. The ledge is about 3 ft wide, and the ore averages $62 per ton in assays. The north and south crosscuts from the drift connecting winzes No. 3 and 4 show 11 feet each. The north crosscut from winze No. 1 in 37 ft, and shows about 6 inches of $90 ore in the face, which looks promising. Not enough work has been done at this point to determine the extent of the ore. The raise on the second level, nearly north of the shaft, is yielding good ore after much selecting. The raise from the east drift on this level has advanced 32 ft during the week; its total length is now 94 ft. The south crosscut from the east drift on the first level was stopped after reaching a length of 183 ft. Work is now being done to the west, where small streaks of ore, giving good assays, are encountered.

ESMERALDA DISTRICT.

LEWIS CON. AND CORTEZ.—*Herald*, June 24: Last Thursday, in company with O. H. Hatch, we visited the Lewis Consolidated and Cortez mines, the former on Middle, and the latter on Last Chance hill. Both mines are looking better than we expected to find them. The Lewis Consolidated, for the amount of work done, has the best showing of the two. In the incline shaft, at a depth of about 40 ft, the pay streak is about a foot thick. The quartz is of the finest quality, and the metal is very evenly distributed, not being found in spots. The ledge is pitching into the hill, and grows better and stronger as they advance. We examined the ore on the dump and could not pick up a piece of it without seeing metal, some of it being "lousy" with free gold. At the Cortez they are stoping ore as rapidly as possible with the force at work. The work at present is confined to the 150-ft level, where exists a fine body of very rich ore.

GRANTSVILLE DISTRICT.

THE CENTENNIAL MINE.—*Bonanza*, June 20: Last Sunday, in company with John Irvine, we took a trip through the Centennial mine. This property shows considerable improvement since Mr. Thos. K. Murphy has had charge as foreman. The drifts in both the upper and lower levels running south are showing some very fair ore, and there is a very good prospect that when sufficient depth is attained a valuable property will be developed. In the west shaft the indications are good for cutting into ledge matter soon. It is the intention of the management to erect hoisting works and open the mine at a greater depth. The croppings on this property are bold, and show traces of mineral wherever broken.

GRANTSVILLE MINERS' UNION ELECTION.—At the regular meeting of the Grantsville Miners' Union on Monday, June 12, 1882, the following officers were unanimously elected for the ensuing term, ending December 31, 1882: President, Matt Halpino; Vice-President, J. P. Martin; Secretary, F. F. Meagher; Financial Secretary, Wm. Henry; Treasurer, Julio Raggio.

LEWIS DISTRICT.

ROAD.—Lewis *Herald*, June 24: The wagon road to the Morning Star mine is now completed to a distance of 2,500 ft from the forks of the canyon. The Eagle mill shut down Thursday, and from a reliable source we are informed that it is liable to remain idle for some time. On Monday, 7 bars of bullion were shipped by the Eagle company, value $1,002.51, the result of the last run of the Eagle and Starr-Grove mines. The lumber, pump, pipe, etc., personal property of the Starr-Grove mining company, has been hauled down from the mine, and considerable of it disposed of. The assay office for the Morning Star mine is completed, and will be in charge of Mr. W. S. Smith, a practical assayer, who will also have charge of the mine. The boiler which was hauled from the Starr-Grove mine is receiving a thorough overhauling. The flues have been removed, and will have the ends cut off, pieces welded on, and be replaced in good shape. The work is being done by Mr. J. H. Bush.

SAFFORD DISTRICT.

AMONG THE MINES.—Cor. Eureka *Sentinel*, June 24: Since my last note in regard to this district, developments of an important character have been made in some of the mines. At the Key West, in the bottom of the shaft (70 ft) the ledge is 5 ft wide, carrying ore assaying $428 in silver and 60% lead. At a depth of 05 ft water was struck, but not in quantity to cause any inconvenience in working. The Jay Bird claim lies east of the Key West, and promises to be a mine equal in value to its neighbor, the Key West. It is one of the oldest locations here, and is in course of development. The ore extracted is galena, and assays as high as $80 per ton. The Contention mine is sacking ore, and will make a shipment of 20 tons of high-grade ore soon. On the Hancock, the drift into the mountain has been driven with good results, the ledge now carrying galena and sulphurets, assaying satisfactorily. The Cumberland claim, the property of Cheney, Fletcher, Maples and Patch, is situated half a mile east of the town of Safford, and promises to vie with the others upon which more labor has been bestowed. On the Mohawk, work has been resumed. A windlass has been constructed over the shaft, and sinking on the ledge commenced. Inclination about 60°; sinking attended with some inconvenience; however, fair progress is made. During the week, Jack Oilmer and Mr. Hollister paid us a visit, and took in the whole situation. The principal mines were thoroughly examined, and the visitors expressed themselves highly pleased with the prospects. This is Mr. Gilmer's second visit here, and he expressed his determination to call again.

TUSCARORA DISTRICT.

PUMP STARTED.—*Times-Review*, June 20: At last, after many vexatious delays, caused by necessary repairs, the large pump at the Grand Prize mine was successfully started this morning, and it is now working steadily. It was the intention to have started it up yesterday, or last evening, but was deferred by the discovery of a break in the exhaust-pipe of the engine, rendering a renewal of the injured part necessary. The capacity of the pump is 8 strokes per minute, discharging 1,090,280 gallons of water in 24 hours, but, owing to the depth, the pump-bob is submerged, and the rate of speed will not exceed 5 strokes until the 500 level is reached, which will take about a week, when full speed will be maintained. The hailing tanks, having a capacity of 400 gallons a minute, are also at work. Superintendent Dixon is highly elated over the clock-like manner in which the machinery does its work.

COLORADO.

BREVITIES.—*Register-Call*, June 23: Mr. Henry, of Nevadaville, is making good wages in sluicing in Nevada gulch, opposite the old mill building of the Montezuma M. Co. Other parties have secured a large portion of the gulch above him on up and above the mill of the Quartz Hill Con. M. Co., and as soon as the branch ditch of the consolidated ditch is completed and water let into it, ground sluicing on an extended scale will be commenced. Many persons are sanguine enough to express the opinion that the ground will pay at the rate of $6 per day to the hand. Hazard Bros. are timbering up a working shaft on the Edgar mine on Quartz hill. This property some months ago passed into the hands of Eastern parties, who have raised a working capital to develop the vein. The owners of the Dorchester group of mines in Lake district are feeling very jubilant over the fact that they have finally reached pay. The 6-stamp mill of Peter Rhu, in Nevada gulch, is running again. Owing to a lack of a sufficient head of water heretofore, the runs of this mill have been spasmodic. Peter says he is bound to keep the stamps moving this time. Mr. Richards, lessee of the Jones mine, Nevada district, is drifting east from the McGonnigal shaft, through which all workings hereafter will be made. Mr. Mackey's Post Hole lode, as developments progress, improves. Recently he has added a number of needed surface improvements, and will soon commence the erection of a commodious shaft building and ore house. Hoisting was resumed from the main shaft of the Gunnell mine yesterday afternoon, the damage to the hoisting gear sustained a few days ago having been repaired. The Manitoba M. Co. in Vermillion district, have the water under control, and are now sinking in the working shaft, and running the south crosscut. Two shifts of miners are employed, and the mine is to be worked actively and systematically.

IDAHO.

TAYLOR'S DISTRICT.—Cor. Idaho *Messenger*, June 26: As I promised you I would let you know what we are doing in this part of Lemhi Co., I have taken this opportunity of letting you know of our mines and other improvements in Taylor's, or Spring Mountain District. Messrs. Pease & Taylor are now building a 25-ton smelter for their mines, of which they have 27. The ores from all of them are very fair, averaging from $75 to $80 per ton. They are working about 40 men on the reduction works and in a few weeks will put about the same number on the mines. Texas District, 8 miles from Taylor's, has recorded 200 claims, of which about one-half are looking very well. The "Solid Man" lode is very high-grade ore, an assay of which went $1,300 per ton. This camp, after more work shall have been done, will be a surprise to Lemhi Co. We visited Captain Rustin's mine, the Viola, on Willow creek, and there we saw the best mine in this locality. Mr. Simpson, formerly of Kinnikinnic, is acting superintendent, and with only three men at work since Christmas, they have sunk to the depth of 120 ft in a large body of sand carbonates; and they have at present, about 700 tons of ore on the dump. Capt. Rustin says he will put up a smelter in a few months.

WOOD RIVER.—Salt Lake *Tribune*, June 24: Almost every day we meet with persons just in from the Wood River country, and from them we are able to learn facts in regard to what is being done there, and form a correct idea of the situation in that argentiferous district, especially as the writer of this has been over much of the country, and is familiar with its locations and peculiarities. The Minnie Moore, Overland, Queen of the Hills, and some other prospects near Bellevue, in Lower Wood river, are sending out ore, which has commenced arriving in this city. The Ada, near Hailey, has sent one car-load of ore here, which sold for $181 per ton; and this new mine promises a large yield. The camp of Bullion, which has produced more than any other district there, is excelling its output of last season. Shipments of ore are now arriving here from the May Flower, Jay Gould, O. K. and Idahoan. In the latter a very important strike has been made within the past few days. During the past winter work progressed on the Idahoan, so that the mine is now in fine condition for working, and the ore output will be very large this season, as the body of mineral seems to grow in size as the mine is worked. One of the largest strikes yet made in that district is on the southern extension of the Idahoan. Two years ago people talked about Wood River prospects—there was nothing else there then—being only surface deposits, did not go down, and would all play out soon, but with the developments going on, we find that the deeper they go in these mines around Bullion, the larger the bodies of ore seem to become, and we have no doubt about the permanency of the veins. Many properties are changing hands in this locality. Ketchum is reported as full of life. The Philadelphia smelter, located just above the town, is by far the best smelting works yet erected in that country. Water brings down timber for charcoal, and turns the machinery for one smelter, which is now turning out over a car-load of bullion per day, making a yield in value of $100,000 per month. A second furnace will be in operation in a few days, thus doubling the product. The same company are erecting similar works at Muldoon, in Wood river, 25 miles east, and at the two places they have employed in mining, building roads, smelting, etc., between 300 and 400 men, making their pay-roll the past month aggregate over $30,000. This is all being done by a company of Philadelphia capitalists, Col. E. Green being the general manager of the Philadelphia mining and smelting company. All over the Wood River country there is general activity and a healthy growth, but no immense boom, as was anticipated would come this season.

MONTANA.

THE SHAKESPEARS-PARROT.—*Inter-Mountain*, June 17: Within the past few days the 200-ft south crosscut of the Shakespeare-Parrot at a distance of 90 ft from the shaft has tapped the ledge, and drifts have been started east and west. The ore body is 3½ ft wide, and samples 23 per cent. copper. The mine produces daily 30 tons of fair grade ore, which is being treated at the concentrator and shipped East at a handsome profit. The concentrator is now running night and day and reduces 70 tons of ore every 24 hours. Mr. Longmaid is now buying ore in considerable quantities and is doing well.

MOULTON.—*Inter-Mountain*, June 22: Recent developments in the Moulton are of a character to inspire the most favorable opinion as to the result of the pending explorations. From Mr. Pat Clark, foreman, it is learned to-day, that the property in all its workings was never before in such good shape, and that the air shaft on the west ore shoot gives great promise of early and very important discoveries.

STEMPLE DISTRICT.—Helena *Independent*, June 24: The quartz mines at the head of Virginia creek, in Stemple district, now being developed by Proctor, Johnson & Co. and John Stemple, are looking remarkably well. Stemple is now running his 5-stamp mill on ore from his own mine, but will make a run also for Messrs. Proctor & Johnson as soon as he is through with the one he is now making. The lead of Mr. Stemple, as well as that of Proctor & Johnson, is represented by Mr. Milo Courtright, who has just returned from a visit to that section, as one of the best defined leads for its size in Montana, and one of the truest veins. The lead has been followed for a distance of 500 ft by tunnels upon both sides of the gulch and shows a vein of uniform width. Although this vein is not large it is very rich, and will average from $40 to $50 per ton in gold. The lowest depth to which the lead is developed by the tunnel is about 500 ft, and at this depth it shows a vein of the same width and richness as at the top. The lead on the west side of the gulch is owned by Proctor, Johnson & Co. and on the east side by John Stemple. The Stemple mill of five stamps is kept constantly running, and there is a demand in the district for another small mill.

NEW MEXICO.

SOCORRO MOUNTAINS.—Cor. *New Southwest*, June 24: The smelter of the Queen City M. & S. Co., at Oak Grove, is nearly complete, and will be ready to crush ore before the 4th of July. Ore is being hauled from the Emma and Caldwell mines to this smelter. The new road from Paschal to Oak Grove via Sewell Springs is a huge accommodation to quartz haulors and freighters, it being a better road and saves nearly three miles.

BURRO.—The Burro mountains are fast becoming the largest and most important mining camp in this Territory. The "building boom" has struck Oak Grove. The rapidity with which buildings are going up and the number of contracts let for the manufacture of building material, is evidence of the energetic vitality existing in the Burros. Twenty buildings which were started last month are now ready for occupancy, with many others in process of construction. Where the stately oak stood six weeks ago there is now the enterprising town of Oak Grove, which contains two stores, three boarding houses, several saloons and a population of nearly 450. Inside of five weeks the crushing of ore and the roar of the furnaces of the Queen City M. & S. Co. will be heard.

PROSPECTING.—The mines situated at Oak Grove, Paschal and Sewall Springs are nearly all producing mineral. From all quarters nothing but prosperity can be heard, and the managers of the mines are enthusiastic in their belief that the Burros will soon be the largest copper-producing camp in this territory or Arizona. The mines are increasing their yield in copper, and the number of new mines being opened and developed is considerably augmented since the first of May last. The Sweet William, Royal and Caldwell mines are gradually, but surely, exhibiting their grand proportions. The more these grand mineral deposits are developed, the greater seem to be their capacities. The Sweet William is being opened as fast as possible. Shaft No. 1 is down 110 ft; a drift is being run now to strike the hanging wall which is nearly 14 ft, and still in rich mineral. The mineral has improved in this mine in quality and quantity as it has been developed, which demonstrates the fact clearly that abundance of copper can be found in the Burros by sinking. Sinking is continued on the main shaft in the Royal mine; in a few days drifts will be started south from the bottom of the shaft to tap the mineral. Ore is being hauled to the Queen City smelter; they are in an excellent body of mineral in the mine. The Emma mine has been leased on the "per unit plan." Messrs. Hall & Hodgson, the lessees, claim that they have realized from $35 to $60 per day since they commenced. They are in a good body of mineral.

OREGON.

QUARTZ.—Jacksonville *Times*, June 24: J. M. Smith has discovered a quartz ledge in his lot in the western end of town.....Henry Klippel has gone to the Squaw Lake Ditch Co.'s diggings for a few days.....D. Caldwell has sold his mining claim on Steamboat to Mr. Shearer, lately from the Willamette valley.....James Ralls, of Willow springs, showed us some fine-looking quartz taken from a ledge he is interested in the other day.....Mr. Derrickson, of Idaho, has some intention of putting up a small quartz mill in the vicinity of Fisher & Bybee's ditch in Willow Springs precinct.....Sheriff Bybee returned from Josephine county yesterday. He says that arrangements have been made to extend his company's ditch to Illinois river, which will be of great advantage. A. W. Hawkett will remain there for the present.

Tapping Bullion in Lead Smelters.

A case involving the right of lead smelters to uee the method of tapping hullion which is now almoet universally employed by them, came up lately before the United States Court at Denver, and resulted in a dissgreement of the jury, their vote etsnding ten to two in favor of the plaintiffs. The plaintiffs were Messrs. Keyes & Arents, and the defendants the Grant Smelting Co., of Leadville. This ie a matter which ie of much interest to those engaged in the emelting business, as Messrs. Keyes & Arents claim to own and control by letters patent the method alluded to. It consists of a tube having an upward elant snd lesding from the bottom of the furnace into a suitable basin or lead well, situated at one side of the furnace and at a convenient slevation. They claim by this means that the molten metal ie obtained in a clean state, and that incrustation, or the formation of hard matter upon the side or bottom of the furnace, ie thereby avoided. The defeudants, on the other hand, claim that there is nothing about the method entitling the plaintiffs to a patent, and hence refused to pay the royalty demanded by them. To prove thie, copies of Karsten's metallurgy were produced in evidence to show that the principle was old, and differed only in application from that in use many years ago in Germany and elsewhere. The views ehown in the book mentioned show clearly that the defendants were right in their claime, hut that instead of a tube leading to a vessel on one side of the furnace and from its bottom, that the old method consisted of a simple eye leading from the bottom of the furnace into the hullion sump or well. Also, that the slag eye was directly over the fore-hearth, allowing the slag to flow into it, if not conveysd away by a slsg canal. That the patent method invented by Keyes and Arents is a great improvement over the old one, there can he no doubt, but the qnestion as to whether the new application of an old principle justifies the issuance of a patent seemed to be the hinge upon which the trial turned. As it was, while not sustained, the patentses were not defeated. The endoreement of the patent would result in compelling nesrly every smelter in the country to pay a royalty to Messrs. Keyes & Arents, and naturally would bring to those gentlemen a handsome revenue. There is nothing definite as to what further stepe of a legal kind will be taken in the matter. The contestsnts seem inclined to let it remain in *statu quo.—Denver Mining Review.*

The Longest Steam Pipe in the State.

The Plumas Eureka quartz mine, situated in Quartz townehip, 30 miles southeasterly from Quincy, is undoubtedly the model mine of the county. The strike of the vein is diagonal with the face of Eureka mountain, and ie reached at different altitudee hy a series of tunnels driven from the sontheast face of the mountain, the higheet being near the summit of the hill, and which ie on the vein its entire length. The loweet—the Eureka tunnel—near the bsse of the mouutain, though driven a distance of 2,300 ft., will not reach the ore body in less than 3,400 ft. The Mohawk tunnel is 500 ft. above the Eureka tunnel, and is at present the main working tunnel of the mine, its total length being about 4,000 ft. The quartz ie delivered at ite mouth, and ie eeot down a tramway to the Mohawk mill, situated at the base of the mountain, near the Eureka tunnel. This tramway ie constructed on trestle-work and provided with steel T rails and round eteel rope, the loaded car going down to the mill hauling the empty one back to the mouth of the Mohawk tuonel. The brake attachment at the top of the tramway is perfect in all its details, aod was designed by the Superintendent and master mechanics employed at the mill. At the mouth of the Mohawk tunnel are the large steam boilers which furnieh the steam used in the two hoisting enginee employed at the head of the ehafts in the tunnel, each of which is sunk to a depth of 300 ft. to the extreme lower works of the mine. The first, known as the Mohawk shaft, is 2,200 ft. from the mouth of the tunnel, and the engine ie supplied with steam through a four-inch pipe. The second, known as Eogine winze, No. 3, is 3,700 ft. from the surface, and is furnished through a 2½-inch pipe, continusd from the four-inch. The steam pipes are encased in a 12-inch wooden hox, packed with ashes and charcoal the entire distance. We believe this to he the longest steam pipe in the State, or in the Uoited Statee, and when put in place was an experiment, which has proved perfectly euccessful.—*Plumas National.*

BEVERIDGE.—The Taylor & McEvoy mill closed down on Monday last for a clean-up. The mill for the past month has run on half time only, owing to some necessary dead work being done in the Keynot mine. Two accidente have happened to the machinery at the mill, which delayed work several days during the month. The result of the clean-up was $12,000 in gold. The ore crushed milled $60 a ton, which ie a good showing. The Keynot mine is now in good shape for taking out ore. The men working hy the day have been dischsrged, and the work of extracting ore has bsen contracted for at so much per ton. There will be a largely increased production of ore during the coming month, and the mill will start up again in a few days.—*Inyo Independent.*

Mines and Stocks.

The fact is becoming more generally known that the real value nf a mine can be better determined by the development of the mine iteelf, than by the moet persistent etndy of the Stock Bosrd bulletine. When the promise of the indnstry of mining wss partially revesled, cspital caught a glimpse of the future, and came, without its ueual hesitstion, to mske investmentsand receive the rewsrd, which wss evident mnet he rich and certsin. Men hought the embryo of mines, hut received instead stock, and wsited patiently for the desd lesf to blossom into life. They ssked for fish, hut in many casee received a serpent, which has stung the bosom of expectation that hss sheltered it. The precious metal in the vein is as true and changeless ae the mighty monntains which enfold it; but stocks are as fickle as the withered leavee of autumn. The ore bodies of the mine are of the eternal verities of nature, real and tangible, while etocks are like a card in the hands of a juggler, and depend largely for their value npon the nnselfishness and integrity of men. If, at the present time, businees men, capitalists and inveetors turn with loathing from the Stock Exchanges, where their property has been made a toy and a game for gambling, and leave these places to languish as in the presence of death, while the mountains are alive with those eeeking the real mines and investing in claims and property, after personal examination, paying their money to the miner and prospector instead of the hroker, those who have toyed too long with the patience of the public have themselvee to blame. It is a fact that the meetings of the Stock Exchanges, at the present time, are a mere farce; people are sick of the dishonest trickery of stock-jobbing and the manipulations to which atocke have been too long subject. It ie also trne, that while this dulluess has been so long prevalent on the stock market, that thsre is more than ueual activity in the eale of real properties and actual minss, and even in stocke hased upon good foundation, in the hands of reliable and truetworthy parties.

Stocks well worn in the market have long waited for the return of old-time activity, bnt have waited in vain. The hook is visihla under the gilded bait. If this condition shall continue until worthless stocks are dead, and dishonest management of valuable minee for etock-jobbing purposes ie branded ao deep by public indignation and neglect that it shall stand in its true place with other crimes of the aame class, then the dawning of a hetter day is near at hand.

The great Stock Exchanges should he the centers of legitimate business, the guardians of public interests, the safeguards of honesty, integrity and businese-like transactione—whose indorsement of stock shonld give it value, whose dealing shonld be above qnestion or auspicion, instead of being the dene of gamblers, the resorte of unprincipled echemers, and the homes of the most unscrupulons robbery of the innocent and trusting holders of valnable property. The name of the great indnstry of mining, broad and far-reaching in its influence and import upon the preeent and future well-being of the nation, has been basely prostituted to the selfish intereets of theee institutione, and has had to bear the odium whioh should have been long ago attached to the dens of infamy, and not to an industry which oan show a pure record and clean hands, and can give most substantial evidence of true worth aod reliable returne for eve-y dollar invested in legitimats development.—*Chicago Mining Review.*

An Almost Deserted Camp.

A correepondent of the Sslt Lake *Tribune* says the once famous camp nf Pioche has a romantic history, but of its 7,500 people, 7,000 are now gone, the mille and mines are now idle, and it is enough to give one the hlues. Of ite story, many of your readers know more than I do. It oan be seen, town and mines, some milee away, perched on the southern slope of a qnartzite mountain spur, which ie capped with a hlack lime, and dry as a powder-horn. Gen. Connor hrought in water from the raoge of which Pioche is a spur. The Raymond & Ely has produced chiefly from a pay chnte 200 ft. long, and extanding only to the 900 level, $13 000,000; the Meadow Valley has prodnced $8 000,000; and other mines, perhaps, $2,000,000. The croppings are eaid to have been discovered and located by Mormons, and to have been relocated by Connor's soldiere, after overawing the Indians who drove away the Mormone. It was man from White Pine and Pahranagat, however, who, in 1869, first made it of account. Uncle Billy Raymond, in debt at Pahranagat $70,000 or $80 000, hrought a five-stamp mill to Bullionville, hought the Burke ground, npon which, and other ground, the Raymond & Ely company was ultimately organized. It is said that the Bank of California at one time offered him $3,200,000 for 16,000 shares of the company stock, total shares theu 30,000. He declined. It was then selling at $180 and paying $7 per share in dividends, monthly, and ultimately packed his hlankets out of the camp as he had packed them in. But he has not lost heart, and still expects to recuperate his fortnnes at Pahranagat or in Arizona. Such is your genuine prospector, now a millionaire, now a pauper, always with a heart equal to any fate.

MRS. BROWN has fonnd it necessary to place in her hotel at Tombstone the disconraging placard: "No mines taken in exohange for board!"

Danger of Swindles at the Mining Exposition.

The *Rocky Mountain Mining Review*, published at Denver, Colorado, where the Mining exposition is to be held, has the following sensible article, which is worthy of attention:

Some time ago the *Review* took occaeion to state that there was iminent danger nf a great many mining swindles being perpetrated dnring the time of the National Mining exposition. As the eesson advances, we are more than ever convinced that such will he the case, snd that the injury thereby inflicted will—if the business is not checked at the commencement—be the cauee of much damage, and bring discredit upon the mining industry. To our certain knowledge, there are mining sharks and "procese" ewindles by the hnndrede, all either on their way here or making preparations to come. It is not too soon to sound the note of warning against that class, and it is ton bad that some effective means cannot he devisnd hy which they can be anticipated in their movements. The exposition will doubtless prove a grand enccess, and be the means of bringing people from the East into a closer knowledge of the actual workings of the mines. It will enable them to see the practical benefits of machinery, and in an hundred ways give added interest to mining as a businese in the eyes of cspital. Of course there will be many honest men who will be on hand to promote sales of good property, and against such we have no word to utter, but our advice to all who visit the West during the exposition is to beware of the "shark." There will be authorized repreeentatives from the different districts to he represented, and as it is presumable that none bnt honest men will be sent, those on the lookont for mines in certain places would do well to consult the ones representing it at the exposition. We do not want the impetus that should naturally follow the euccess of the expoeition in mining matters followed by the disastrous effects of numerous swindlee. Those having at heart the real intereets of the mining State will do well to keep on the watch for transactions of questionable character. The *Review* will certainly do its share in this respect, and it behooves the local mining press to do likewise. Thus guarded, the industry whose greatness snd profit is our pride and boast will be well protected.

The Gold Fields of West Africa.

That the west coast of Africa ie to he the future El Dorado seems, from information received therefrom, likely to be a *fait accompli* at no very remote period. Each fresh piece of information which comes forward from that region goes to strengthen the conviction which nae lately gained ground, "that here lie hidden great stores of the suriferous metal, only waiting the skill and patience of man to unearth." This information is furnished by men of position and ability to judge, who are on the spot, and whose practical knowledge is worth the opinion of a thousand theorists. No discouraging accounts have come to hand; two new undertakings—the Gold Coast Co. and the Etfuenta—have quantities of ore on the surface, evincing mnoh richnese, and some actual bullion is now on the way home from the latter company's mine; the managers of both these undertakings sending most cheering information as to their prospects. There is no doubt that the great difficulty to bs overcome ie the proper working of the mines and effectual orushing of the quartz, and there is no reason, provided that due care be taken in selecting the proper men for the grinding operations and the proper machinery, which must be strong but comparatively light for crushing the ore, why the various energies now concentrating on the west coast of Africa should not meet with a result even exceeding the expectatione of those who have embarked in them. The directors of these undertakings cannot be too cantione in the various progressive steps of the work, and doubtless those now commencing will reap much benefit from the experience of those who have suffered from precipitancy; a little time spent at the beginning is time saved in the end, and the patience of shareholdere is more certain of reward by a liberal exeroise of that quality. The Chairman's remarks at the etatutory meeting of the Guinea Coast Gold M. Co., seems to ehow that the above is the spirit in which that company's directors intend to grapple with their task, and which intention it is confidently believed is the one most likely to lead to a speedy and valuable result.—*London Mining Journal.*

BRISTOL is filled with men in eearoh of employment, who have hean brought there hy false reports sent abroad. The men connected with a company—in fact, the only company that has employed any force of men in Bristol district—say there is not a possible show for men obtaining any kind of employment out there, so men in search of employment will do well to keep clear of that town.—*Pioche Record.*

HOME SCHOOL.—We would call attention to the advertisement of the "Home School" for young ladiee in another column. The principal is Miss H. N. Field, a lady who has heen long and well known for her excellent educational work. The eohool ia pleasantly situated at 1825 Telegraph avenue, Oakland, and has an excellent reputation among those acquainted with its management.

Northern Arizona Mines.

The Prescott *Courier* says: There is hardly any longer room for doubt that a full-fledged quartz boom is striking northern Arizona. The incessant, never-ending, never-tiring, topic of epeech and intercourse, from our solid men down to the bar-room sleepere, ie quartz, quartz, quartz. The festive hurro no longer disports himself in quiet solitude through shady woode. He is impressed into such active service that hie brain must ere this have developed the idea that all hnmanity in this section have gone crszy over the bonanzas to be found in our hills. He may he met wearily toiling along mountain paths, staggering nnder loads of ore for the smelter, or outward bound with bacon, heans and hlankets to the toilers who are searching every mountain crevice for the precious ores. Men who have lived here for yeare, indifferent to thoir metalliferous surroundings, and whom it wss supposed were as destitute of mining enthusiasm as a clam, are quietly sneaking off to the hills to view the ground for themselves. Mining experte, coming from God knowe where, clad in canvas garments and repreeenting untold capital, conree wildly through our streets from early morning till dewy eve, going and returning from the minee. The livery etables are depleted of riding animals, the assayers are overrun with work, location notices are sold by the ream, and even the infection has struck the printing offices, and the typo listlessly working at his case thinke ever and only nf the golden treasure that lies waiting in the woods beyond the encircling hille.

Mines are being sold, more are about to be sold. Money is the mushroom growth of a night, and the burro puncher of yesterday today disports himself in fine attire and has a heavy hank acconnt. Truly is the railroad working wonders for us, and we constantly see before us in imagination the ontspread city of 50,000 people to whom the *Courier* expects to recount daily the doings of the world here and elsewhere. Viva the boom!

. AMERICAN GEOLOGISTS.—A committee was appointed at a meeting of the geologists attending the Cincinnati session of the American Association for the Advancement of Science, to enter into correspondence with American geologists concerning the formatiou of an American Geological Society. Messrs. N. H. Winchell, of Minneapolis; John R. Proctor, of Frankfort, Ky.; Henry S. Williams, of Ithaca, N. Y.; John Collett, of Indianapolis; G. C. Swallow, of Columbia; Wm. J. Davis, of Louisville, and S. A. Miller, of Cincinnati, members of this committee, have addressed a circular letter to active and professional geologists, in which the needs of a society are strongly set forth. The committee invites geologists to submit their views and recommendations, in order that a report may be presented at the forthcoming Montreal meeting of the American Association for the Advancement of Science.

THE Winnemucca *Silver State* says: The rate for fine silver at the Carson mint has been reduced to $1.14½ per ounce, hy order of the Treasury Department. The price of bullion at Carson depends upon what bullion is worth at London; but all other American products, save silver, are protected hy a high tariff. Pennsylvania iron and coal, Louisiana sugar and molasses, New England calicoes and California hlankets, Carolina rice fields and New York wood pulp, are all protected from foreign competition by a tariff so so high as to he almost prohibitory, but the silver miner must sell the product of his labor for exactly what it brings in the London market.

A MAINE grocer who had just "experienced religion" acknowledged in meeting that he had been a hard sinner, cheated cuetomers by adnlterating hie goods, etc., but, being converted, would repay any one he had wronged. Late that night he was awakened by a ring at his door-bell. Looking ont he saw a man. "Who are you, and what do yon want?" he asked. "I'm Bill Jones. You said to-night you would repay those you had cheated. Give me that $100 you've owed me so long." "Can't you wait till morning?" "No; I ain't going to wait till then and stand in line all day." He was psid.

A TEREDO GUARD FOR OCEAN CABLES.—At a recent meeting of the directors of a cable company operating in Chinese and Australasian waters there was exhibited a section of cable damaged by the teredo. So destructive was thie guttanercha horer that the company had been put to an expense of $40,000 a year in taking up damaged cables; to save this outlay they were now putting down a ribboned cable at a cost of $300,000. A four years' trial had demonetrated that by covering the cable with a hraee tape or ribbon, their attacks could he successfully resisted.

BRISTOL S. M. COMPANY.—Thia company is now carrying on its work in a manner that ought to have been done long ago. Mr. Roe informe ue that the company will soon commence erecting hoisting-works over the Mayflower shaft. The mill hae been closed down the past week, owing to the breaking of the pump, which is being repaired at the Raymond & Ely shops. Arrangements have been made with the Meadow Valley foundry for a set of new pans. The lste runs made by the mill were not successful.—*Pioche Record.*

SILK-PLATED jute is now largely nsed in the manufacture of carpets. The finest Wiltons and Brussels are nine-tenths jnte,]

The Engineer.

The Hudson River Tunnel.—The Hudson river tunnel has been an object of curiosity to engineers ever since its projectors began the task of sinking a caisson into the soft mud of the Jersey shore, and the work has been prosecuted with peculiar difficulty, owing to the loose and sandy character of the soil. The excavation is carried on with pneumatic pressure, and it is found very difficult to keep up the requisite pressure, from the fact that the air leaks through the soil very rapidly. Recently the air blew out through the soil and the water came in, and for some time work could not be resumed; but thanks to the former sad experience, the men got out safely, but for some time work could not be resumed, and it was feared that the system would have to be abandoned. The air at last got the better of the water, and work has been progressing as before. The size of the plates that protect the masonry has been reduced, the brick-work is kept as close to the excavation as possible, and every precaution is used to control the air. Whether the work can go on without further accident and loss of life is a question. Besides the liability to accident in this manner, the men contract certain diseases which follow working in compressed air, and, although the utmost precautions are taken to guard against these disasters, the danger is still very great. Careful investigations have revealed the chief causes of these diseases, and it is hoped that the measures taken to protect the men will prevent further sickness. Though the work on both sides of the river seems to be going on at present with all the precautions which can be thought of, it would not be surprising at any time to hear that it had been suddenly stopped by an accident and that lives had been lost.

English and American Iron-clads.—It is a curious fact that the British admiralty are experimenting with inclined armor to resist heavy guns, and what is still more curious, have come to the conclusion that the resisting power of an armor plate is greatly increased by giving it a considerable angle with the line of fire. Years ago, in the early days of iron-clads, it was found by our Government officers that at considerable degrees of inclination a very thin plate was capable of keeping out heavy shot, and this principle was extensively applied during the war to our iron-clads. This principle, however, was entirely disregarded in England, where the opinion prevailed that inclination was of very little value. This opinion was founded, however, upon insufficient data, the inclinations that were tried having been altogether too small to be effective. At the present time three and four-inch armor, inclined at very considerable angles, has been found to do so good work that further experiments are promised, and the opinion is gaining ground that a turret with highly inclined sides may, after all, be the turret of the future. If the principle can be successfully applied, the weight of the plates upon iron-clads can be greatly reduced, or what is the same thing, the resistance of the plates used greatly increased.

French Engineering.—France leads the world in engineering schemes, and seems determined to maintain it. Her latest proposition is to spend $300,000,000 in the construction of a ship canal from Bordeaux, on the Bay of Biscay, to Narbonne, on the Gulf of Lyons, a distance of 238 miles. This would make a direct connection between the Atlantic and Mediterranean, but should not be confounded with the scheme to join the Loire and Rhone by canal, and thus secure the same result. The mode of locomotion proposed is that of towing the vessels by steam engines running along the banks, the estimated time in traversing the canal being three days. The financial success of the Suez canal, the receipts of which, for 1881, were upwards of $3,000,000, will doubtless be an inducement to many to invest in this enterprise, and it is said to be receiving liberal encouragement from French and other capitalists.

The Great Coal-gas Engineering Scheme.—The gigantic undertaking for conveying coal-gas from the United States coal regions to the seaboard is said to be taking a more definite shape, but it has not yet been decided whether the works will be located in the Connelleville region or in the West Virginia coal fields. It is designed to have branches from the six-foot main to Baltimore, Philadelphia, Washington, Wilmington, New York, and other cities. The estimated cost of the works and pipes is $45,000,000, of which $25,000,000 will be furnished in cash and the balance in bonds.

The Mississippi Canal.—The project of connecting the Mississippi with the great lakes via the Illinois and Chicago rivers is constantly gaining ground. The latest proposition is for a much larger waterway than was at first suggested—nothing less than a first-class ship canal, with extensive wharfage room, etc.

The Largest Chain.—There has lately been made at Hull, England, a chain of Siemens steel, 180 yards long, containing more than 3,200 links, held together by about 850 steel pins. It is intended for lifting purposes, has an estimated strength of 60 tons, and is thought to be the largest chain of its kind ever made.

Useful Information.

Dust Explosions.—Prof. T. W. Tobin, in a paper read at the reception of the Millers' Association by the Polytechnic society, of Louisville, a short time since, advanced a plausible theory to account for the mysterious and terrible mill explosions which have occurred in different parts of the world, particularly at Glasgow, Scotland, and in Minneapolis, Minn. Professor Tobin maintains that the dust on the outside of the wheat grain contains organic spores, which are highly inflammable, and render the dust about and the dust room the most dangerous places in mills. To illustrate the explosiveness of flour the Professor has devised a flour-gun, composed of a pyramidal shaft and barrel, with a gas burner at its base, air holes in its sides and a hopper at the top. At the bottom of the hopper is a movable shaft operated by an outside trigger. The hopper is loaded with flour or mill dust, and the mouth of the gun is covered with a stout newspaper. The lighted gas creates an upward draft and heats the air. When the trigger is pulled and the dust or flour is charged with the heated air, a tremendous explosion follows, the paper is blown to shreds, and takes fire by the great heat generated in this way. It is well known that the air of a flour mill is very dry, as is demonstrated by the electricity generated by the belts, and that fine flour will rapidly deprive the atmosphere of its natural humidity. He suggests that mills be provided with wet-bulb thermometers, and that when the air becomes abnormally dry, steam be injected from the boilers into the mill. As a moist atmosphere is held to be conducive to making a whiter and better flour, there would seem to be no objection to the simple remedy suggested.

What is Meant by 150,000,000 Tons of Coal.—Not less than 154,184,300 tons of coal were taken out of British mines last year, and to do this work 495,000 men were employed. Sir Henry Bessemer has been endeavoring to make people realize what that quantity of coal really is. He says that if this coal were formed into cylindrical columns 50 ft. in diameter and 500 ft. in height, and if these were placed in a row their own diameter apart, they would make a colonnade 85 miles 750 yards long, the product of each working day being sufficient to make 14 such columns. Another method of giving some idea of the immense nature of the British coal industry is this: The coal extracted last year would make a wall 200 miles long, 100 ft. high and 41 ft. 11 inches thick, a mass exceeding that of the great wall of China by enough to add 346 miles to its length. And yet so vast are the British coal deposits it is estimated that they will yield the present output for 800 or 1,000 years to come.

A Novel Method of taking lumber from the river has been put into practical operation by the Hannibal (Mo.) Transfer company. The scheme is to run flat cars down to the river bank and out on the bed of the river for a distance of 200 ft., and cribs of lumber are then floated on top of the flat cars and drawn out by two engines upon the bank. The cribs are 32 ft. long by 16 ft. wide, and contain 10,000 feet of lumber. They are then removed to the yards of the company and taken apart, the boards being washed by hydrant water clear of the sediment dirt which attaches as they come down the river. The method will have the effect of making it possible to handle several times the amount of lumber shipped in former years.

The Demand for Mahogany in the manufacture of furniture has, perhaps, increased four-fold within the last two years. This increase comes from the demand for high-priced furniture, as well as from the deterioration and scarcity of black walnut. This beautiful wood is now largely being made use of for interior finish—many of the finer houses, banks, insurance offices, etc., being finished with it. Its use is entering rapidly into the construction of railway carriages—a source of demand uniformly good for hard woods. The chief sources of supply of mahogany are Mexico and the West Indies, and the United States takes 25 to 30 per cent. of the entire production.

Impermeable Leather.—The following process for rendering leather impermeable, says the Mancheeter *Mechanical World*, is given by Mr. Jacques, of Hemning, near Sarrebourg. It depends on the property of soap solution being decomposed by acids, and being transformed into fatty acids which are insoluble in water. The leather is dipped before using in a solution containing from two and a half to five per cent. more soap dissolved in water. The tannic acid contained in the leather, more or less, according to the method of tanning, transforms the soap solution into insoluble fatty acids, and renders the leather perfectly impermeable.

Wood Knots are in great demand, to meet the increased esthetic taste of the day. They are subjected to a steaming process which softens them and develops their color, and are then used in exceptionally fine veneering. Persons who are experts in judging what knots are of value, make considerable money by going about looking for them. Two were recently shipped to New York from Caledonia in that State, which weighed respectively 1,150 and 1,490 pounds.

To Prevent Decay of Wood Posts.—The decay of wood embedded in the earth is difficult to guard against, but, according to the *British Farmer's Gazette*, a simple precaution, costing neither money nor labor, will increase the durability of posts put in the ground by 50 %. This is simply by taking care that the wood is inverted, *i. e.*, placed in the opposite direction to that in which the wood grew. Experiments have proved that oak posts put in the ground in the same position in which they grew, top upward, were rotten in 12 years, while their neighbors, cut from the same tree, and placed top downward in the soil, showed no signs of decay for several years afterward.

Cleaning Brass.—The government method prescribed for cleaning brass and in use at all the United States arsenals is claimed to be the best in the world. The plan is to make a mixture of one part of common nitric acid and one-half part sulphuric acid in a stone jar, having also ready a pail of fresh water and a box of sawdust. The articles to be treated are dipped into the acid, then removed to the water and finally rubbed with saw-dust. This immediately changes them to a bright color. If the brass has become greasy, it is first dipped in a strong solution of potash and soda in warm water; this cuts the grease so that the acid has free power to act.

Wooden Thread.—The manufacture of thread from wood for crochet and sewing purposes has, it is said, recently been commenced in the middle of Sweden. It is wound in balls by machinery, either by hand or by steam, which, with the labeling, takes one minute and 12 seconds, and the balls are packed up in cardboard boxes, generally 10 in a box. Plenty of orders from Sweden have come in, but as the works are not in proper order, there has hardly been time to complete them all. The production gives fair promise of success, and it is expected to be very important for home consumption.

Bronzing Wood.—Some one connected with one of the largest furniture manufactories in New York has devised a new process of bronzing cherry wood, which appears to be much superior to any other, and which is being used to great advantage by the firm. The process has not been patented, but is kept secret.

Soldering cast-iron, says the *Engineer*, is generally considered to be very difficult, but it seems to be only a question of thoroughly making bright the surface to be soldered, and using a good solder and a clean swab with muriatic acid. Sodium amalgam might be usefully employed for the purpose.

Good Health.

Eggs vs. Meat.

Meat is very expensive, being 50 % higher than it was last fall, and the economical housekeeper is casting about for a less expensive article of diet in that line. Would it not be wise to substitute more eggs for meat in our daily diet. About one-third of the weight of an egg is solid nutriment. This is more than can be said of meat. There are no bones, no tough pieces that have to be laid aside. A good egg is made up of 10 parts shell, 60 parts white and 30 parts yelk. The white of an egg contains 66% water, the yelk 52%.

Practically, an egg is animal food, and yet there is none of the disagreeable work of the butcher necessary to obtain it. The vegetarians of England use eggs freely, and many of these men are 80 or 90 years old, and have been remarkably free from illness. Eggs are best when cooked four minutes. This takes away the animal taste that is offensive to some, but does not harden the white or yelk so as to make them hard to digest. An egg, if cooked very hard, is difficult of digestion, except by those of stout stomachs; such eggs should be beaten with bread and masticated very finely. An egg spread on toast is food fit for a king, if kings deserve better food than anyone else, which is doubtful. Fried eggs are less wholesome than boiled ones. An egg dropped into hot water is not only clean and handsome, but a delicious morsel. Most people spoil the taste of their egg by adding salt and pepper. A little sweet butter is the best dressing. Eggs contain much phosphorus, which is supposed to be useful to those who use the brain much.

According to Dr. Edward Smith, in his treatise on food, the value of a pound of eggs as food for sustaining the active forces of the body is to the value of one pound of lean beef as 1,584 is to 900. As a flesh producer, one pound of eggs is about equal to one pound of beef. With regard to pork, taking into account the nutriment in each, and the comparative prices of the two on an average, the pork is about three times as costly a food as eggs, while it is certainly less healthful.

Too Much Mineral Water.—The Paris correspondent of the *Lancet* writes: "There is no doubt that a great number of dyspeptic cases that are met with in civilized countries owe their origin to the abuse of mineral waters; the result being undue dilatation of the stomach, and the production of atonic dyspepsia, one of the most harrassing forms of the malady for both patient and physician."

How to Resuscitate Drowning Persons.

The State Board of Health has issued from Sacramento a circular respecting the resuscitation of persons supposed to be drowned, of which the following is a copy:

The season for deep water, especially sea, bathing being at hand, the State Board of Health issues the following advice and directions, which may be profitably adopted in case of accident by drowning. They are simple, always available, require no delay, and can be effectually practiced by any intelligent person until medical aid can be obtained. Many lives are annually lost by drowning through ignorance on the part of bystanders of the proper method of restoration, and many sacrificed by the use of inefficient and improper means. The plan of treatment is the "Direct method" suggested by Dr. Howard and adopted by the New York Life Saving Institution.

1. Instantly turn the patient downward, with a large, firm roll of clothing under his stomach and chest. Place one of his wrists or arms under his forehead, so as to keep his mouth off the ground. Press with all your weight, or with a force proportioned to the age of the patient, two or three times, for four or five seconds each time, upon the patient's back, below the shoulder-blades, so that the water may be pressed out of the lungs and stomach, and drained freely out of the mouth.

2. Quickly turn the patient, face upward, with the roll of clothing under his back, just below the shoulder-blades, so as to make the head hang back as low as possible. Place the patient's hands above his head, where they may be secured by a handkerchief or cord. Kneel with the patient between your knees, and fix your elbows firmly against your hips. Now, grasping the lower part of the patient's naked chest, squeeze his two sides together, pressing gradually forward with all your weight for about three seconds, until your face is nearly over the face of the patient. Then with a push suddenly jerk yourself back. Rest about three seconds; then begin again, repeating these bellows-blowing movements about 8 or 10 times a minute for at least one hour, or until the patient breathes naturally. By these alternate movements foul air is pressed out of the lungs and pure air is drawn in.

The above directions must be used on the spot the first instant the patient is taken from the water. Lose no time. A moment's delay and success may be hopeless. Observe that neither apparent death nor much delay in the appearance of the signs of life afford just grounds for despair. Perseverance is often rewarded by success, even after an apparently hopeless prolongation of insensibility. Act promptly and steadily, following closely the rules given. Prevent crowding around the patient. Fresh air is essential. Should the patient commence to breathe, be careful not to interrupt the first short natural breaths. If they be long apart, carefully continue between them the bellows-blowing movements as before. After breathing is regular, let the patient be rubbed dry and wrapped in warm blankets. As soon as the patient can certainly swallow, a little warm spirit and water may be given. This should be done cautiously, lest the patient may be choked. After restoration, let the patient be kept quiet and sleep encouraged.

The above rules are intended for adoption in the case of adults. For younger persons the force applied should be modified to suit the age, "the operator feeling his way as to how little or much he is doing, or may do, and regulating his course accordingly."

A New Antiseptic.—Prof. Barff, an English chemist, is reported as having announced to the Society of Arts the discovery of a new compound which he calls boro-glyceride, consisting of glycerine, the water of which has been expelled and replaced by anhydrous boracic acid. The new antiseptic (the formula of which is $C_3H_5BO_3$), at ordinary temperatures, is a glacial mass, becoming semi-fluid when warmed, and freely soluble in hot water. The solutions employed by Prof. Barff in his numerous experiments on foods vary in strength from 1 in 20 to 1 in 60 parts of water. The London *Times* editorially says that the discoverer exhibited to his audience "a table covered with various articles of food preserved by the method—pigeons, turtle, fruits from Jamaica, sardines from Spain, lobsters, herrings, sprats, fowls, pheasants, a tongue, oysters, beef and mutton." These had "all been kept for periods ranging from a few weeks to several months, and in none of them, either to the taste or smell, was there the slightest evidence of decomposition."

A bad cold will run its course of about 10 days in spite of what may be done for it, unless remedial means are employed within 48 hours. Many a life will be spared by cutting a cold short off in the following manner: On the first day there is an unpleasant sensation of chilliness. The moment you observe this, go to your room, and keep it at such a temperature as will entirely prevent this chilly feeling, even if it requires 100° Fahr. Put your feet into hot water half-leg deep, adding hot water from time to time for a quarter of an hour, so that the water will be hotter when you take your feet out than when you put them in; then dry thoroughly and put on thick woolen stockings; for 24 hours eat no food, but drink freely of any kind of warm teas, and at the end of that time, if not sooner, the cold will be effectually broken, without any medicine whatever.

Passing Events.

There is very little new to say of the general mining situation other than we have mentioned in our "Mining Summary." The miners in the hydraulic mining regions are beginning to build dams to restrain the cobbles and heavier sands, since, by so doing, they can have the injunctions now standing against them dissolved. The debris decision was by no means as sweeping as was at first supposed, and does not by any means satisfy the anti-slickens people.

Several new strikes are chronicled of late. An Australian who purchased a claim of Paul Bauli for $50, near Bald Mountain, a year ago, last week took down to the city about $16,000, which he had taken out of the mine in a short time. It is stated that during the year he has taken out in the neighborhood of $50,000.

The Tuolumne *Independent* mentions another strike, which is worthy of more than passing note. It says:

Jim Divoll's lucky strike still holds out. On the 14th inst., accompanied by Bill Long, Jack Coles and Joe Hampton, as guard, Divoll took from Sonora $126,000. About three months ago he took down 230 lbs. of gold; and in the course of four months he has taken away $182,000. This is only a small portion of the money that has come from the mine. When taking into consideration the inexpensive way of working, employing but three or four hands, and that this amount of gold was taken from a space of only a few feet square, with a large body of the same sort in sight—we may truthfully say that this little gem, right in the heart of the city of Sonora, is the richest quartz claim ever struck in the mines of California.

Preparations are gradually being made for the Denver Mining Exposition. Thus far nothing has been done by California, and it is not likely now that this State will cut any figure at all at the exposition.

Pump for Chlorination Works.

In any process of treating ores by chlorination where the chlorine gas is employed under pressure, it is necessary to condense it, and the pumps and valve gear employed to carry it become corroded in a short time so as not to work, especially where exposed to the action of a strong current of gas, as when it is passing through the valves.

Mr. Pierre C. Du Bois, of this city, has just patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an invention which is intended to overcome this difficulty by the use of glass for valves, and at points where the chlorine gas impinges against the sides of the valve opening, or the walls of a passage. A combined glass and rubber seat and glass valve is used, in connection with a valve chamber and connecting passages formed of lead, or other suitable non-corrosive material. The passage leading from the pump to the valves is preferably formed in lead, and at its lower end is formed a chamber sufficiently large to receive the lower valve, and allow it to work. A lead disk, of the same diameter as the vertical portion of the tube is made to fit upon the top of the valve seat, and it has a similar chamber formed in its lower surface to receive the upper valve.

The valve seats are formed of glass, as are also the valves. Around each valve seat is fitted a rubber ring, the edges of the seat being formed in any way to hold the two together, as by tongues and grooves. The glass seats are of such a size that they just fill the diameter of the passage, while the rubber rings rest upon the ends of the metal, inclosing the passages. There are two disks or flanges, having holes through their edges to admit long screw-bolts, which extend down outside the valve chamber, and serve to bind the whole together. Rubber rings receive the pressure and protect the glass seats from breaking, but are not sufficiently exposed to the action of the gas to become destroyed. The glass valve seats surround the narrow opening, through which the gas passes at considerable speed when pumped, and thus prevent corrosion at this point, while the valves themselves, being made of glass, will not corrode.

The lead, T, is sufficiently non-corrosive for the main passage; but if used at the valve opening, the gas would soon cut it so that the valve seat would leak and become worthless, which is prevented by this device.

It might be supposed that the glass valve would break easily. In fact, several mechanics expressed that opinion. Experience shows, however, that such is not the case. At the Victorine mine, Smoky valley, Lander county, Nevada, it has been in use some months. Here the pump is 18-inch stroke and 4 inches in diameter. It might be supposed that the valve would raise well up, but it only lifts about a sixteenth of an inch. A pump with these valves has been in use at the Bunker Hill mine, Amador county, for over a year, and not a single valve has been broken. None were ever broken at the other mine. This device has been of great benefit in the Mears chlorination process, where difficulty was experienced with the ordinary pumps.

Lighting Mine Lamps by Electricity.

Whenever safety lamps are extinguished by fire-damp, they have to be taken to the surface to be re-lighted, unless, indeed, the state of the colliery permits of there being a lamp-room underground; and during the time thus occupied, the miners must necessarily remain idle, if the stock of lamps be not sufficiently extensive to permit of several being held in reserve. Struck with the loss of time and expense which this proceeding entails, M. Hubert, Ingenieur des Mines, and M. Henry Durant, lately brought before the Hainault Society of Mining Engineers a method of re-lighting, by means of electricity, safety lamps which have become extinguished by fire-damp—and that without opening them or removing them from the air which may at any moment become explosive. The bottom or reservoir of the lamp is provided with two tubes of metal, in which fit tightly two wooden plugs. These serve to hold and to insulate two copper wires connected by a short platinum wire passing close to the wick. On making contact with a battery, the electric current raises the platinum wire to a white heat and lights the lamp. Various batteries have been tried for this purpose, but as portability, and, at the same time, high power were required, the bichromate battery was ultimately selected. In order to surely avoid the sparks which are produced on breaking contact, and which would ignite an explosive mixture, two spiral springs hold the zinc and carbon plates clear of the exciting liquid, so that to make the current pass, it is necessary to press the lamp firmly down upon the electrodes. As soon as the lamp is re-lighted, the pressure on the electrodes is released; they rise from the liquid, the current no longer passes, and consequently no sparks are produced on breaking contact. Existing lamps may be modified so as to be lighted by electricity, at a cost not exceeding six pence each; and it is fairly claimed that this cost, together with that of the battery, will soon be repaid by the saving of oil resulting from only lighting the lamps when they are required for use, instead of at the mouth of the shaft. A practical demonstration of the new system was given before the members, who regard it as amply conclusive.

The Debris Decision.

Various Opinions Regarding It.

On the announcement of the debris decision by Judge Temple, those who only read the "head-lines" in the daily papers imagined that the whole question had been finally settled in favor of the farmers, and that hydraulic mining in California would be likely to come to a stop. The MINING AND SCIENTIFIC PRESS at the time expressed the opinion that the decision was by no means as sweeping as was generally supposed, and that so far from stopping hydraulic mining, it gave the industry an opportunity, under certain restrictions, to continue under cover of the law. The real thing the decision did was to assert the principle that miners had no right, as they supposed they had, to deposit their tailings in the bed of the stream. Now that time has elapsed to carefully consider the question, the mining community, as well as the farming, is beginning to see the decision in its true bearings. The farmers do not take it as well as at first, and the miners take it the better, though they will be put to great expense in carrying out the provisions. A great many companies are beginning work on dams which will impound the "bowlders, cobbles and heavier sand." As soon as they do this, Judge Temple will remove the injunction now restraining the miners from work. We quote from a few other journals in different counties what is said of this question:

The Nevada *Herald* says: The North Bloomfield gravel mining company have commenced building a large stone dam for the purpose of preventing the cobble-stones and coarse debris from their mine from flowing into the Yuba river. According to the decision rendered by Judge Temple, hydraulic miners will be allowed to run provided some means are taken by which the heavier and coarser particles of the tailings can be impounded and kept out of the rivers. It is this point in the court's decree that has caused the Bloomfield company to begin building a dam. Other hydraulic mining companies will doubtless follow their example.

The Placer *Times* says: We infer from the Nevada *Transcript* that the miners of Nevada county propose building dams and continue hydraulic mining in accordance with Judge Temple's decision. As there are enough mines and rich enough to justify the building of dams in that section, it is well enough that they should do so. But what will become of the mines about Dutch Flat? To dam Bear river will be a costly affair, and it would hardly justify the owners of mines dumping into that stream to go to the expense of $200,000 or $300,000. What can be done?

The Georgetown (El Dorado) *Gazette* expresses itself as follows: Judge Temple's recent decision against the Gold Run Hydraulic Mining Co. is generally considered as harmless to the mining interests of the State. We consider it useless to enter into details of the decision, as it does not affect the mining interests in this county, only so far as hydraulic miners may be compelled to impound the cobble-stones and bowlders (but not the muddy water). We can see no great disaster to mining interests by the decision.

The *Mountain Messenger* (Sierra county) speaks as follows: As we predicted, the Grangers are not satisfied with the debris decision. They have contended from the start that they were warring only upon hydraulic mining, and were willing that other kinds of mining should continue. We, for one, have never put any faith in their professions, for the reason that they were lying so regularly and continuously about everything connected with mining, and it was only to be expected that they would lie about that, if it would be to their advantage. Now come the people of Wheatland and "Resolve, that they are entitled to the rivers in their natural purity, and will not be content with water carrying in suspension even the fine sand and clay of the hydraulic mines." The fine sand and clay of the hydraulic mines is no more than the fine sand and clay of other mines, and it will not be many months before the whole pack of Grangers, with Hart and Cadwalader in the lead and the *Bee* tailing after, will be in full cry upon the trail of quartz and gravel miners.

The Placer *Herald* has this to say: The decision of Judge Temple, in the Gold Run case, has, by this time, been generally passed upon by the people, and has elicited numerous opinions concerning its probable effect upon the two great industries immediately affected, and the country in general. * * * Its effect will be of the most disastrous character, throwing out of employ thousands of industrious men who have families depending upon them for support, causing them to abandon their homes, which are the results of years of assiduous economy, reducing districts that have for years been the scenes of business activity and prosperity to a vast uninhabited wilderness, and destroying a very prolific source of State and county revenue. While it affects the miner so disastrously, the expectations of the farmers are not realized. Should the terms of the decision be strictly adhered to, the debris that already exists in the canyons will, for years, continue to descend upon the valley below, causing a continuation of the destruction complained of by the farmers almost indefinitely. In order to effect an amicable settlement of this great question, it will be necessary to call into requisition the aid of both the State and National Government. To build dams of sufficient magnitude to retain the debris in the mountains will require an outlay of capital beyond the ability of private enterprise. To dredge and straighten the navigable water courses and build levees sufficient to protect the farmers from the flow of debris already in the canyons, and future inundations, will tax the farmers beyond their ability, and, in our opinion, nothing short of a general effort by the people can produce the desired result. It is, in every way, the people's cause. Millions of dollars worth of taxable property is affected thereby. If the value of every hydraulic mine in the State is stricken from the tax roll, it will very sensibly affect every taxpayer in the State, and we have no doubt that when the people shall have taken a second sober thought upon this matter, that measures will be adopted to so reconcile the now conflicting interests as to be acceptable to all.

The Amador *Ledger* says: The owners of land along the various streams affected by hydraulic mining are not fully satisfied with the decision of Judge Temple in the famous anti-debris suit against the Gold Run mining company. This suit was instituted in the name of the people of California, on the ground that the running of such vast quantities of tailings into the river channels injuriously affected so many people that it might properly be proceeded against as a public nuisance. In that view of the case a perpetual injunction was prayed for against the defendants. Judge Temple, in granting the application, takes a more conservative view of the situation than many farmers would wish. Indeed, the mining population generally regard the decision as favoring them as much as the agriculturists. The right of the farmers to be protected from the ruinous flow of coarse slickens is conceded. On the other hand, the right of the miners, not merely to extract the gold form the earth by hydraulic process, but to discharge the light debris into the natural channels is recognized. The decision imposes on the Gold Run Co. the duty of holding back from the river channels the heavy detritus, and the inference is, that when provision is made for this, the injunction will be dissolved. The judge truly points out, that to prohibit the miner from using the river beds in any way for the dumping of tailings would virtually put an end to all mining—quartz as well as hydraulic. There is no known and practicable process of mining by which the muddying, and consequent partial filling up, of the natural waterways can be prevented. So that to give absolute protection to the valley settlers from all possible damage to their lands by the inevitable tendency of the mining debris to fill up the rivers, means nothing less than death to all mining industry. Judge Temple's decision plainly admits this dilemma. He has avoided an extreme position, realizing that the mining interest must and will be carried on in the future as in the past, but at the same time holding that it must be conducted with a due regard for the property rights of others. This view seems sound, but it falls short of the expectations of the rabid anti-debris men. They have announced that nothing short of the cessation of all mining, and the restoration of the rivers to their native purity, will satisfy them. They will act wisely if they let well enough alone, and rest with the legal victory they have won. If they push the fight to the end that the streams be freed absolutely from mining debris, they will be whipped out of their boots.

There are not more than a dozen large hydraulic mining companies indirectly affected by the Gold Run decision. That is to say, the heavy slickens, the discharge of which into the streams is declared a nuisance and enjoined, is the product of no more than 10 or 12 mines. These eventually may be compelled to construct reservoirs to catch the slickens; but the bulk of the mines, which contribute only the finer debris, will move on their way unchecked as heretofore.

The Temple decision, while perhaps as full and definite as it could be made, leaves plenty of room for legal wrangling. The question will arise, where is the line to be drawn between the heavy material which the court says must be kept out of the rivers, and the lighter material, the dumping of which into the natural channels may be continued. The point, we venture to say, is much finer than any debris from the hydraulic mines.

EASTERN COMPANIES.—J. P. McCollough, who has had charge of the McCollough antimony mine, at Little Cottonwood, left Monday last by private conveyance. His destination is supposed to be Utah. Mr. J. P. Courter, who is general manager of the property, has telegraphed to the sheriffs on the route to return the team and wagon, which is the property of the company—an Eastern one. It seems an easy matter to get Eastern capitalists to invest money in mining properties, and they are, as a rule, handled to the best advantage while they will put up. If the Eastern companies would take the trouble to inquire about the antecedents of those who are so anxious to disburse their funds, instead of howling after their dollars when the investment has proved a failure, their mining ventures would probably pay them a fair rate of interest on the capital invested. A sweeping denunciation against the whole State of Nevada by the Eastern press will now be in order.—*Lewis (Nev.) Herald.*

Now that warm weather has come, says a Philadelphia paper, the rich and the tramps are both leaving town. Thus the cities get rid of all their idle population.

The National Holiday.

The revolving months have brought us again to the eventful July, and to the holiday of holidays in the United States—the anniversary of the Declaration of Independence. By common consent and long usage, the Fourth of July has come to be regarded as the harvest time of patriotic thoughts and expressions, and is the day which both young and old Americans delight to honor, each in their own way. With the young it is a day of spectacles and tumult; with the old it is a rest and recreation, coupled with patriotic reflections and prophecies. To all, the day is welcome.

It has become trite to allude to the items of our national progress. The orations and essays of the Centennial year gave the country such a feast of these patriotic effusions that the appetite has cloyed of them, and the tendency has been of late to make Fourth of July eloquence assail the weaknesses of the nation, rather than extol its virtues. This is well enough, for the hosts of abuses and oppressions practiced by those in power and privilege have made the statement of the Declaration, that all men were created free and equal, seem a cruel satire. And yet, while one is keenly conscious of the defects of our governing, which admits of extortion by privileged classes, or malfeasance by those in positions of trust, it must not be forgotten that, in these evils, we are not alone in the world, or that, if one should attempt to escape these wrongs by emigration to other lands, it would be but flying to ills we wot not of.

Every nation is entitled to be judged by its best work. This is the principle in ranking an artist or an author, and this is what we, as people, have a right to demand in all judgments passed upon our institutions. Moreover, no people can be fairly condemned for evils which they themselves see and acknowledge, and which they are struggling to remove. It is those who are enamored of their vices, or insensible to their evil conditions, that deserve the sharp sting of the satirist; those who are casting about for the means whereby to escape from bad conditions are entitled to encouragement and co-operation. But it is no new thing among satirists for them to fiercely denounce vices after every one has acknowledged them to be vices, and to send all their arrows at those who have thrown down their arms.

There is, no doubt, a less effective general administration of affairs here than abroad; but, before we take this too much to heart, it would be well to inquire into the compensating circumstances. We should scarcely be the gainers if we substituted the slovenly streets of our cities for the elegant boulevards of Paris, if, in so doing, we should have to saddle ourselves with Napoleonism. It is not difficult for arbitrary will to remedy a hundred minor evils; communities so governed always make the best show to the eye, and are superficially under far better regulation. There is no need of pointing out at what cost this elegance and outward serenity are purchased. One cannot deny the superiority in many particulars—by no means in all—of English law and administration; but it is clear we should be the losers if we bought with all this authority and smooth order, the supremacy of a class, the centralization of land and wealth, the impoverishment of the mass. It is not to be denied that we might have, and ought to have, many of the advantages of foreign systems, without losing any that we now possess; it is, moreover, certain that, in time, we shall attain many of them; but in Nature and law there are always compensations, and hence we should not be in despair, even if a government, in pursuit of its own principle of the largest liberty, the largest space for unrestrained individual action, should find it necessary to withhold its hands from some things that would be better if put under restrictions.

But it must be believed that the near future will bring great reforms in our national administration of affairs, so that our social system shall not be a fabric of petty tyrannies, while we still draw the breath of national freedom and independence. There has been great progress made of late in showing forth the discriminations, oppressions, and extortions of monopolies. The courts have already held that the people had rights which must be respected. It is quite fair to believe that the movement will go on until men are found with courage and skill to frame regulations which shall restrain public servants from assuming the place and prerogatives of masters.

There is good reason, then, for congratulation and rejoicing over our national progress. Our position in trade and manufactures, in fact, our industrial character generally, is the wonder and admiration of the world. Our homes are improving, our children are enjoying educational advantages which the world cannot equal. In all our boundaries there is peace and plenty, while elsewhere wars rage and famine brings unuttered woes. Of a surety the national holiday of July, 1882, will be a goodly day to celebrate, and if the public demonstrations be far from the homes of some of our readers, they have still the opportunity for patriotic conversation or musings which may stir the blood and cheer the heart with patriotic pride. Let all, therefore, take part in the celebration, each in his own way, and thus show appreciation of our goodly heritage—a land of freedom and abundance.

Ore Sampling.

Two weeks ago we quoted from the *Columbia School of Mines Quarterly* an article on "Ore Sampling," by Mr. S. A. Reed. In this number of the PRESS we continue the subject as follows:

Prof. Egleston, in *Engineering* of December 15, 1876, describes several automatic sampling devices in use then in Colorado.

Some experience in sampling ores in Colorado has given me an opportunity of testing many of the methods by comparison, and I find the automatic arrangement I am about to describe perfectly satisfactory. It is a counterpart of one previously used at a sampling works in Clear Creek Co.

I pass every lot of ore first through a Blake crusher, set tolerably fine, and then through a pair of Cornish rolls, whence it is elevated by an endless belt with buckets to a revolving drum-screen with meshes one third of an inch square—what fails to pass the screen being returned to the rolls by a chute. The ore which passes the screen goes down the chute through the automatic sampler directly into a sack held at the mouth of the chute.

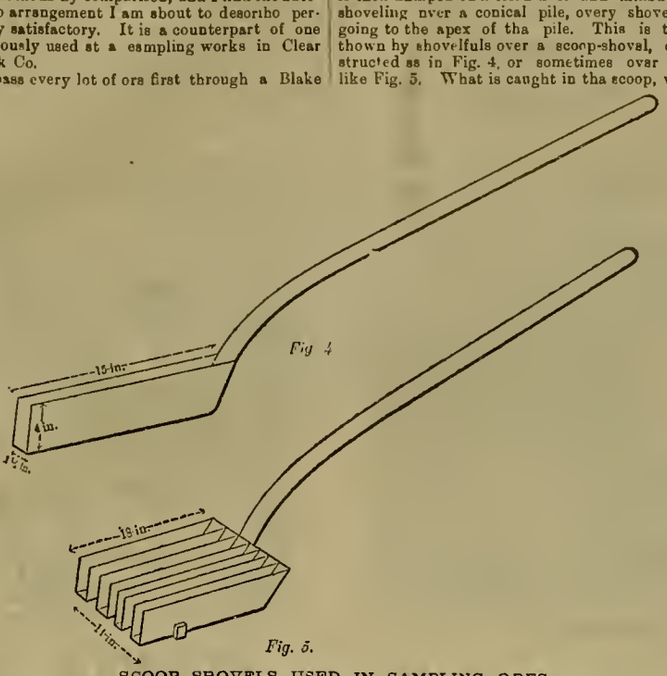

Fig. 4

Fig. 5.

SCOOP SHOVELS USED IN SAMPLING ORES.

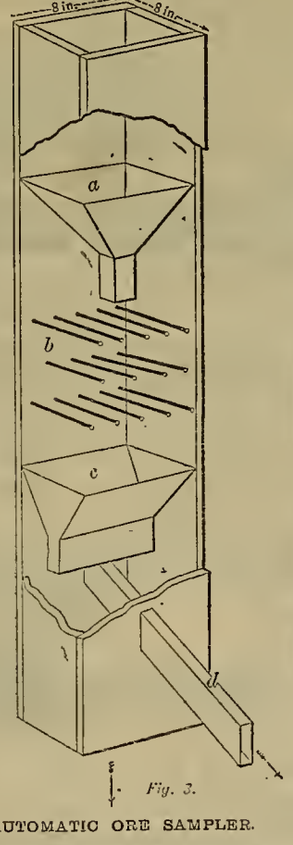

Fig. 3.

AUTOMATIC ORE SAMPLER.

I have used a patent sack-fastener which can be tied up in a half a minute, and dispenses with sewing. One sack is tied while the next one is filling. The automatic sampler I use is shown in Fig. 3: (*a*) is a sheet-iron funnel by which the falling ore is thrown together into a small stream, whence it falls on (*b*) and is immediately scattered over the entire width of the box and falls into funnel (*c*), which, from the shape of its mouth, discharges a flat stream 12 inches by 1 inch, and thoroughly mixed. The trough (*d*), one inch wide, is placed directly under (*c*), and at a sharp inclination, and carries off constantly one-tenth of the stream, the remainder going directly into the sack. The trough (*d*) leads by a tube into a box, and the portion conveyed there constitutes the sample.

Thus, when a 10-ton lot is run through the mill, a one-ton sample is found in the box. This is then dumped on a clean floor and mixed by shoveling over a conical pile, every shovelful going to the apex of the pile. This is then thrown by shovelfuls over a scoop-shovel, constructed as in Fig. 4, or sometimes over one like Fig. 5. What is caught in the scoop, viz., about one-tenth of the main sample, is dumped alternately in two heaps, making a double sample, called original and duplicate. The two samples are then each cut down separately by throwing again over the scoop-shovel, sweeping up carefully each time, until they weigh about 10 lbs. each, when they are taken to a small pulverizer, constructed like a coffee-mill, and connected with the shafting. Here they are ground to about the size of coarse sand. Each sample is then thoroughly mixed by rolling on an oil-cloth, and then cut down on an ordinary tin splitter, like Fig. 5—of rather deep and wide troughs, however—to about 2 pounds, when it is ground on a rubbing-plate till all passes a 20-mesh sieve. It is then cut down on a finer splitter with one-half-inch troughs to about three-quarters of a pound, and this is finally ground on the plate till all passes an 80-mesh sieve.

The two pulp samples are then mixed thoroughly on glazed paper, and each divided into three portions—one for the sampler, and one for the miner, who has it assayed by his own assayer as control, while the third is sealed up to serve as umpire in case of disagreement; buyer and seller have each an original and duplicate, and each is assayed in triplicate, so that 12 assays are made on the lot. The triplicates should agree well, to satisfy one of a correct assay; original and duplicate should agree, to satisfy one of a correct sampling; and the control must agree with the sampler, to satisfy the seller of fair dealing. A difference between sample and control of one per cent. on the whole value is usually settled by halving the difference, while a larger difference calls for a reassay and perhaps for a resampling of the entire lot.

In resampling, the whole lot is shoveled over the scoop-shovel on the floor of the mill. When both parties are satisfied, a settlement is made at schedule rates, or the lot is put up for bids.

In some sample pulverizers the ground material falls directly over a set of segmental boxes grouped radially around the vertical shaft of the grinder. Seller and buyer then choose each a box for his sample.

Mechanical samplers are of limited use, however, in Colorado. Most of the smelters' sampling establishments sample by shoveling the entire lot over the scoop on the floor. At Salt Lake the quartering method is adopted. Where ores are to be smelted raw, as in Leadville, it is objectionable to have them brought to the fineness necessary for mechanical sampling. The practice then is to pass the lot through a Blake or Dodge crusher and through coarse rolls; to sample by scoop, and pass the large samples through finer rolls called sample-rolls; to reduce again with the scoop to a small lot which is put through a sample-grinder, and finally to a lot which is ground fine on a bucking-plate. Automatic samplers require the material to be crushed rather fine, and to be screened, lest coarse pieces clog the apparatus. For rich silver ores of irregular character, rather fine crushing gives a more accurate sample. Ore carrying native silver, coarse, is almost impossible to sample, but I have found that moderate quantities of wire silver disappear on the bucking-plate into fine powder which is quite evenly disseminated. Grinding in a mortar does not produce the same effect. Wet ore cannot be sampled, but ore need only be dried sufficiently to prevent adherence and packing.

It would be an interesting problem to work out mathematically from the doctrine of chances the principles of good sampling of an irregular mixture.

The points to be observed are:

First.—That there must be a certain maximum limit in the sample to the ratio between coarseness and quantity; for example, a panful of ore containing pieces as large as an orange would scarcely be a safe sample of a lot of ore.

Second.—There must be a minimum limit to the ratio between size of a direct sample and the entire quantity from which it is taken.

Third.—The method of taking the sample must be impartial in its action and free from any tendency to select one set of particles at the expense of others; for example, from 10 tons of rich ore of the coarseness of gravel it would not be safe to take a first sample weighing only a few ounces. Further diminution must be preceded by further comminution.

Fourth.—Thorough mixing must be effected, and by a method which is free from any sorting action.

By pulverizing an entire 10-ton lot to 80-mesh fineness and thorough mixing, one might take a 10 ounce sample directly, but the aim is to minimize the crushing, hence one proceeds by successive steps. To take a one-tenth sample from a 10-ton lot, I might take the first step by simply crushing till no piece was larger than 2½ inches diameter; but other conditions impel me to grind further, viz., the saving of wear on sacks where hard quartz is abundant, and the requirements of my automatic sampler.

All sampling processes have to be conducted with a view to guard against fraud, while granting full opportunity to the miner to convince himself that he is fairly treated.

The double sample is a great protection against tampering from outside, while, on the other hand, the miner is invited to witness every stage of the process while his lot is being sampled. One sampling-works in Colorado has a room with glass sides in the centre of the building, in which the miner site and watches his ore sampled without being able to touch it.

The practical working of the sampler I use is attested by the fact that with a season's average of over 150 ounces per ton, the lots shipped have been in every instance resampled at the smelter by scoop-shovel, and the differences rarely amount to 1 per cent.

THE COMSTOCK.—"Well, I rather guess the Comstock's played out for good" was what a wise man said on board a hitter-bound Central Pacific car. And the remark seemed to voice the sentiment of the talkers, until one, who had been listening to the general croaking, ventured with apparent diffidence to remark that the time had hardly come yet to write Ichabod on the once prolific Mount Davidson. "It's true," said he, "Virginia City is as dull as the tomb, but the old camp is not dead. I know something about the history of silver mining, and the supposition that the Comstock is played out—that all its ore bodies have been discovered and worked out—reverses all the teachings of mining history. It is conceded that the great fissure is intact at its greatest depth; that it retains all the normal conditions of an ore-bearing lode. Now, I believe that ore bodies occur below just as they occurred above, and that these bodies are likely to be disclosed any day—and don't you forget it, either, boys. Played out! Why, the Comstock will be raising the same old devil when we're all forgotten!"—*Reno Gazette.*

PROSPECTING.—Now that the airs of spring bless us once again, the blood of the old prospector warms up in his veins, and the old fire of hope and expectation animates what is left of the old hulk. Even if blossoming hair, trembling step and rheumatic supports prevent him from again taking the field with burro, camp-kettle and frying-pan, he lives in the memory of "the days of old, the days of gold, the days of '49," when "me an' Jim an' Missoury struck it lonsy, you bet, on the north fork of Mexican," and he fairly revels in the bliss of getting a good listener to hear of the days when pork and beans were the staff of life, and a stumpy pipe, venerable with age, brown with use and strong enough to prospect for itself, was the great and only luxury. Tho' his days of prospecting are over, may he long be spared for the good he has done.—*Eureka Sentinel.*

THE 28 page edition of the S. F. MINING AND SCIENTIFIC PRESS, of June 17th, is on our table, and it is all that its publishers claimed it would be. Among its editorials are: "Water Required in Working Quartz," "Ore Sampling," "Miners' Inches for Various Horse Powers," "The Debris Decision," "Shaft Sinking," "Blow-offs and Air Valves in Hydraulic Pipes," and "Scale of Horse Powers." It contains several interesting illustrations, besides a host of information under the heads of "The Engineer," "Useful Information," "Good Health," "Mining Summary," "Scientific Progress," "Mining Stock Market," "Miscellaneous." You cannot spend a 10 cent piece to a more profitable use than in sending it to Dewey & Co. for this number of June 17th.—*Georgetown Gazette.*

THE labor demonstration at Pittsburg on the 17th had over 22,000 trades-unionists in line.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Bruntou's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. R. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE.

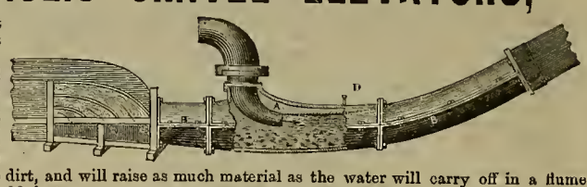
HYDRAULIC GRAVEL ELEVATORS,



For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

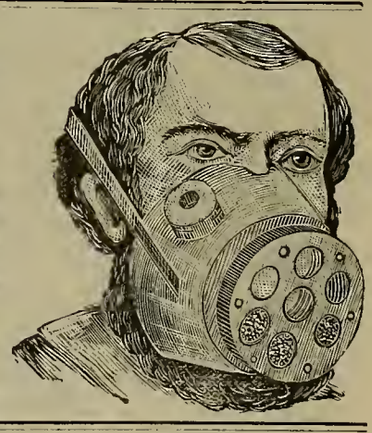
JOSHUA HENDY.

No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co., S. F.

PATENT

LIFE-SAVING RESPIRATOR

Prevents Lead Poisoning and Salivation.



INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price. Address all communications and orders to

SETH MARSHALL, Grand Hotel,
Or C. C HARVEY,
309 California Street, S. F., Cal

Send for Descriptive Circulars containing testimonials of well-known parties who are at present using them.

DEWEY & CO.'S

Scientific Press **Patent Agency.**

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞ Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

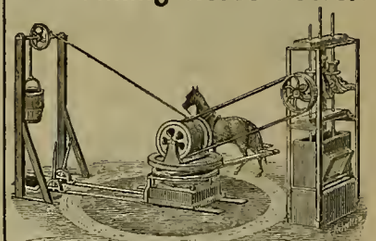
New Mining Horse Power.



The demand for a better Horse Power, suited to more general use, has resulted after much experience in the above machine, which we can recommend as a First-class Hoisting Power, under complete control of man tending bucket, through levers connecting with brake and clutch.
This power is light and strong, so that two or more horses can be used for crushing ore or other work.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR THE WEEK ENDING JUNE 20, 1882.

259 745—SHOE FASTENING—R. P. Bryant, S. F.
259,667—NOZZLE—Thos. C. Churchman, Sacramento.
259 830—PUMP VALVE GEAR—Pierre C. DuSois, S. F.
259 861—PLOW JOINTER—H. Huntsman, Sacramento.
259,765—VEHICLE DAVICE FOR CHECKING HORSES—Wm. P. Kirkland, Hanford, Cal.
259,957—MANUFACTURE OF ICE—Samuel D. Lount, Phœnix, A. T.
259,940—FRUIT GATHERER—Leonard Stone, San Luis Obispo, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

FRUIT GATHERER.—Leonard Stone. Patent No. 259,940. Dated June 20, 1882. This improved fruit gatherer consists of an endless traveling belt, arranged to operate in connection with a frame or conveyer, and having cutting devices. The object is to gather fruit from the trees readily. In using the device, any kind of stand is employed, or, if light enough, the stand may be dispensed with. The upper end of the conveyer is elevated into the tree, placing it just under or in proximity to the fruit. By turning a crank, the belt travels upward with its cutters, one of which, on account of the convex or semicircular shape, fits over the fruit; and its cutting edge, being thus brought in contact with the stem, cuts it. The fruit being embraced by the cutter or gatherer, is directed into the conveyer. The fruit picked in this way is not bruised by falling on the ground.

PUMP VALVE GEAR.—Pierre C. DuBois, S. F. No. 259,830. June 20, 1882. This invention relates to certain improvements in the valve chambers, seats and valves of pumps which are employed to condense chlorine or other corrosive gases. It consists of a combined glass and rubber seat and glass valve, in connection with a valve chamber and connecting passages of lead. This invention is fully described in another column.

News in Brief.

A LARGE whale committed suicide by hanging himself with the telegraphic cable laid across the Persian gulf.

THE outlook for fine crops of all kinds has never been better than in almost all agricultural sections of Nevada.

IT is expected that the Postoffice Department will have a surplus of $1,000,000 at the close of the fiscal year, June 30th.

MR. CUNNINGHAM, a fruit grower at Griffin, Ga., has 60,000 peach trees in bearing condition, besides thousands of other kinds of fruit trees.

A LETTER from Fort McKinney states that cattle valued at $13,500,000 are calmly grazing in what was, six years ago, absolutely an Indian country.

THE cyclone which ravaged Leavenworth, Kan., on Saturday week, took but 20 minutes to inflict a damage of $200,000. The wind blew at the rate of 70 miles an hour.

A MEMBER of the Jewish Aid Society of New York city states that a number of Jewish refugees who refuse to work will be returned to Russia with their families.

MANY prospecting miners are striking out into the new districts along the line of the Carson & Colorado railroad. Strikes in that direction are being constantly reported.

A MAJORITY of the persons arraigned for crime, according to one of the best-known New York judges, are boys from 12 to 20 years of age, who have got into trouble while intoxicated.

THE Society of Decorative Art of California offers 11 cash prizes of from $20 to $100 each for the best pieces of embroidery according to specifications, the most artistic in design, color and work.

Pacific Coast Weather for the Week.

[Furnished for publication in the PRESS by NELSON GEROM, Sergt. Signal Service Corps, U. S. A.]

The following is a summary of the rainfall for each day of the week ending 11:58 A.M. Wednesday, June 28th, at noon, for the stations named:

Date.	Olympia.	Portland.	Roseburg	Red Bluff	Sacram'to	San Francisco	Visalia.	Los Angeles.	San Diego.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto willed with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing
Press, Box 2361, S. F.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

A TURNED LEAF will point out the article supposed to be of special interest to persons receiving sample copies of this paper.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central systemin San Francisco.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

HOW TO STOP THIS PAPER.—It is not a herculean task to stop this paper. Notify the publishers by *letter*. If it comes beyond the time desired, you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

ANNUAL STATISTICIAN of 1882.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 502 Taylor st. Price, $4.

EXCURSION
TO ALASKA.

The August trip of the Steamship IDAHO to Alaska will be made a special feature of interest for tourists and pleasure seekers. In addition to her regular ports of call (Wrangel, Sitka, Harrisburg, etc.) it is intended she shall visit Glacier Bay and other points of special interest.

The trip from Puget Sound to Alaska, instead of being, as many imagine, rough and tempestuous, is made nearly the whole distance on inland waters, which are as smooth and unruffled as a mountain lake. The scenery is a magnificent panorama of wondrous grandeur. The noted and celebrated points of interest in California and other States dwarf into insignificance in comparison with the wonderful sights and towering mountains in this wonderland of glaciers, icebergs, Aurora Borealis and nightless day. Only a limited number of passengers can be taken from San Francisco, as a large number of tourists have engaged to go from Portland, Victoria and other northern ports.

Those desiring to engage passage will please register their names at the Company's Ticket Office, 214 Montgomery street. No name accepted unless accompanied by a deposit of $20 on account.

The fare for the round trip has been fixed at a low rate of $115, which includes meals and a berth.

Passengers will take the DAKOTA, which leaves Broadway Wharf July 29th, at 2 P. M., and transfer to the IDAHO at Port Townsend about August 3d, reaching San Francisco on the return about August 25th.

Educational.

PREPARATION

FOR THE

MASSACHUSETTS

INSTITUTE OF TECHNOLOGY

Is a specialty at **Chauncy-Hall School**, Boston, Mass., and its remarkable success can be ascertained from the Chairman and Secretary of the Faculty of that celebrated institution.

It aims to fit its candidates so thoroughly that they will not be weighted by "conditions" to be made up after entering.

The School is within two minutes' walk of the Institute, affording unequaled opportunities for consulting the professors.

It is also very near many of the most elegant buildings in Boston.

HEALTH receives unusual attention. MILITARY DRILL under competent officers.

Chauncy Hall has annually sent classes to

COLLEGE

For nearly fifty years, and has had but one certified candidate rejected.

THE BUSINESS COURSE

Gives such a generous culture as fits a young man to take a high rank as a merchant.

This is the **oldest and largest** private school in Boston.

The fifty-fifth year will begin Sept. 13th.

The Harmon Seminary,

BERKELEY, CAL.

A NEW BOARDING AND DAY SCHOOL, FOR YOUNG LADIES.

Will be conducted by REV. S S HARMON and Mrs. F. W. HARMON, for the last 10 years principals of Washington College

The HARMON SEMINARY will receive girls of all ages; the instruction comprising Primary, Preparatory and Academic. Thorough course in the English branches. The Arts, Music and Modern Languages in charge of well known masters. Special course preparatory to the State University.

The HARMON SEMINARY will be first-class in all respects, and will combine the best educational advantages with home care, guidance and guardianship.

The first year will open August 3, 1882.

For prospectus and other information, address

S. S HARMON, Berkeley, Cal.,
Or. E. J. WICKSON, 414 Clay st., S. F.

THE HOME SCHOOL

—FOR—

YOUNG LADIES,

1825 Telegraph Avenue, Oakland, Cal

The next year will begin on

WEDNESDAY, JULY 26, 1882.

H. N. FIELD, Principal.

W. E. CHAMBERLAIN, J T. A. ROBINSON

PACIFIC Business College, 320 POST ST. SAN FRANCISCO.

LIFE SCHOLARSHIPS, $70.

Paid in Installments, $75.

Send for circulars.

SACKETT (FOR BOYS) SCHOOL.

Takes first rank for thoroughness and ability of its teachers; also for home care.

Business, Classical, and English Departments.

Next Term commences July 17th

Send for Catalogue to D. P. SACKETT, A. M., Principal, Oakland, Cal.

CALIFORNIA COMMERCIAL COLLEGE

417 Kearny Street, San Francisco.

Persons in the country ordering to the amount of $12, I pay the express charges. I sell nothing but my own manufacture.

PISTON ROD PACKING.

For the best in the world, address, GEO. C. PHILLIPS, Silver City, Lyon County Nevada. Circulars free.

TONITE.

From Mersey Railway Contract.

SUB-OFFICE, 17 JAMES ST., LIVERPOOL, JUNE 7, 1882.

I have pleasure in stating that your Tonite is the only explosive in use on the works, and that it is giving every satisfaction. The men do not suffer any ill effects from the fumes of the smoke after firing, and can at once return to their work. (Signed.) JAMES PRENTICE, Agent.

From Severn Tunnel Contract.

PORTSKEWET, ENGLAND, June 3, 1882.

I have much pleasure in stating that I am thoroughly satisfied with your Tonite. I have been using, for some months, 10,600 lbs. per month, and I prefer it to any other explosive I have tried. The men are able to return to the face within a few minutes after firing their shots. (Signed.) THOS. A. WALKER, Chief Engineer.

From "James Watt" Dock, Greenock.

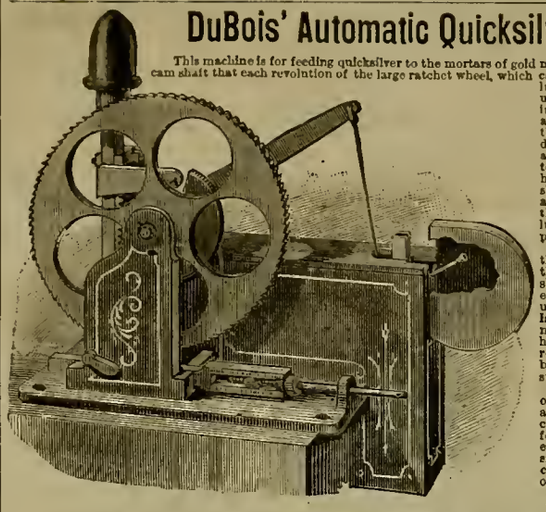
GREENOCK, SCOTLAND, June 5, 1882.

I have pleasure in stating that Tonite has been used on the above works since they were started, over three years ago, and still in use. I can testify to its advantages in regard to strength, safety and expedition in charging. I have found it as effective in Rock, Bowlder, Clay, splitting up Bowlders, breaking Metal, etc., as any of the explosives I have ever experimented with. (Signed.) JOHN WADDELL, by WM. KERR, Manager.

TONITE POWDER CO.,

No. 310 California Street, - - - SAN FRANCISCO.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; i. e., from every one to four minutes.

Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents

22 & 24 Fremont St., San Francisco.

Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

Colorado Iron Works,

MANUFACTURERS OF

ENGINES, BOILERS, RAILWAY CAST AND WROUGHT WORK, BRIDGE WORK, BOLTS AND BOLT ENDS, BUILDING WORK, ETC.

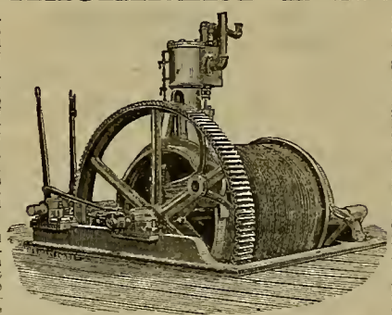
MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tayeres, Blowers, Cupellation Furnaces, Market Kettles, Wire Rope Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.



COLORADO IRON WORKS,

P. O. Box, 1921, - - - - Denver, Colorado.

STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequaled strength, toughness and durability.

An invaluable substitute for forgings or cast-iron requiring three-fold strength.

Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.

15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings.

CRANK SHAFTS, SHOES, DIES and GEARING specialties.

GOLD SAVED

BY USING MY

SILVER PLATED AMALGAMATING PLATES.

These Plates are used in Quartz, Gravel and Placer Mining with gratifying success. I am constantly filling orders for them, and when once used they prove themselves so superior to any other process yet discovered for saving Gold that my customers would not do without them. I have the best facilities on this coast for filling orders for these plates, and will guarantee my work. Old Mining Plates Bought, Taken in Exchange for New, or Re-plated.

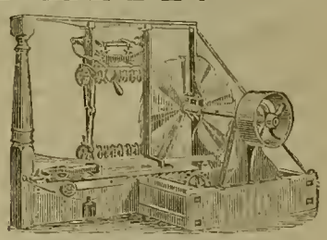
PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

Send for Circulars.



SHINGLE MACHINE.

For simplicity, durability and rapidity of action, these Machines have no equal, cutting from 3,000 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIOINAL AND ONLY VALID NITRO-GLYCERINE PATENTS

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO.,

SAN FRANCISCO, CAL.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS.

☞Send for Pamphlet showing methods of testing the different qualities of all Powders.

The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT, No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." t is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, JULY 8, 1882.

VOLUME XLV Number 2

New Desulphurizing and Oxidizing Ore Furnace.

Wm. T. Browne, of Stockton, Cal., has patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an improved desulphurizing ore furnace, drawings of which we herewith present. Fig. 1 shows a perspective of the furnace. Fig. 2 is a vertical longitudinal section of same. Similar letters indicate like parts. *A* represents the outside masonry of the furnace, having at its rear end an escape flue, or chimney, *B*, which opens into the rear end of the ore chamber, while another flue, *C*, opens into the upper part of the fire-place, and is inclined backward, so that its upper end opens into the chimney, *B*, at the rear, as shown.

In the top of the furnace is a lid, or cover, *D*, over the feed opening, *E*, of the ore chamber shown in Fig. 2. In the front is the fire-place, *F*, with its grate bars, *G*. From the top of the fire-place, *F*, the flue, *C*, opens directly upward, and behind the fire-place the ore chamber, *H*, is situated and connected with the fire-place by a horizontal passage. The rear end of the ore chamber opens into the flue, or chimney, *B*, as before stated.

In the flue, *B*, is placed a diaphragm *b*, having a contracted central opening, *c*, large enough to permit the escape of the gas and smoke, but with some difficulty. *N* represents the discharge-opening from the ore-chamber. The rear end of the ore-chamber is covered by a plate, in which is an aperture to allow the passage of the handle of the stirrer, and at the bottom is a roller, upon which the handle moves. *P* represents the stirrer, having a handle, *Q*, extending out through the aperture in the rear end, and supported on a roller. A swinging plate, with a suitable notch, is adapted to swing down around the handle, to prevent the entrance of air through the aperture. The stirrer is made of a length equal to the width of the ore-chamber, and has a triangular or prism shape, with one of its sides resting upon the floor of the ore-chamber, so that when moved to and fro over the floor of the ore-chamber it will thoroughly stir the ore.

When the precious metals are combined with sulphur, ores are formed, which, on account of the difficulty in working, are called "rebellious ores." These require to be slowly heated or roasted, to drive off the sulphur, and in the process it is necessary to admit air for the purpose of having the oxygen assist the operation. Heretofore the flame from the fire-chamber has usually been directed at once and continuously into the ore-chamber, and because of its presence therein much of the air introduced must be consumed to feed the flame, and therefore the occupation would occupy more time.

At the forward upper end of the ore chamber is hinged a gate, *J*, adapted to swing upward to a horizontal plane, in which position it covers or closes the end of the flue, *C*, or to swing downward to a vertical plane in order to close the mouth of the ore chamber.

In the rear of the fire-place is a heavy metal plate, *K*, or some substance which will stand the fire; in this plate is formed a passage, *L*, which, by winding back and forth, traverses considerable space. The lower and outer end of the passage receives air from a fan-blower, and the upper and inner end has a slot formed in it the width of the ore chamber and opening into it.

In this device the ore is fed through the opening, *F*, and at first the swinging door, *J*, is elevated, to close the flue, *C*, and open the ore chamber, *H*. The flame is directed into the ore chamber, and when the ore is sufficiently heated to continue its combustion, with the assistance of the air through the passage, *L*, the gate, *J*, is dropped and the flame shut out from the ore chamber. It then finds an outlet through the open flue, *C*. The ore is still kept sufficiently heated by the burning of the sulphur contained in it, and the air which is forced in supplies oxygen to continue the combustion, and also to oxidize the ore. This air is intensely heated in its passage through the winding chamber, *L*, and is delivered directly into the ore chamber, no portion of its oxygen being taken up in assisting the combustion of the fuel or gases from the fire-place, and its full effect is reserved for the ore.

The blower connection enables the invention to have a steady current of air, and not rely upon the unassisted draft. By making the escape flue, *B*, contracted by means of the perforated diaphragm, *b*, the air within the ore chamber is partially compressed.

The operation of stirring in working sulphurets is a recognized necessity. The more air that is brought in contact with the ore, the better will the sulphur burn. If the ore is not stirred, the sulphur will burn on top and protect that below from the action of the air, so that but a very small portion is affected. It must, therefore, be constantly stirred. The objection to this operation is in the fact that to insert a stirrer, something must be opened, and the cold air will rush in and reduce the heat of the furnace.

This result always follows when the opening through which the stirrer is passed is in the front or on the sides of the ore chamber, because the cold air must circulate therein in finding its escape; but in this furnace, by having the chimney, *B*, at the rear of the ore chamber, and the aperture also in the rear, it can be opened without danger, because the cold air will pass up the chimney, *B*, which is in convenient proximity, and thus not affect the temperature of the ore chamber.

Another advantage obtained for this construction is that for the reason just given—the apertures may, with safety, be allowed to remain open when desired. An opportunity is thus afforded to obtain a view of the inside workings of the ore chamber, in order to know where to stir, that the ore may be kept well distributed and prevented from massing in any portion. This advantage is a desirable one, as the stirring may be done intelligently.

Fig. 1.

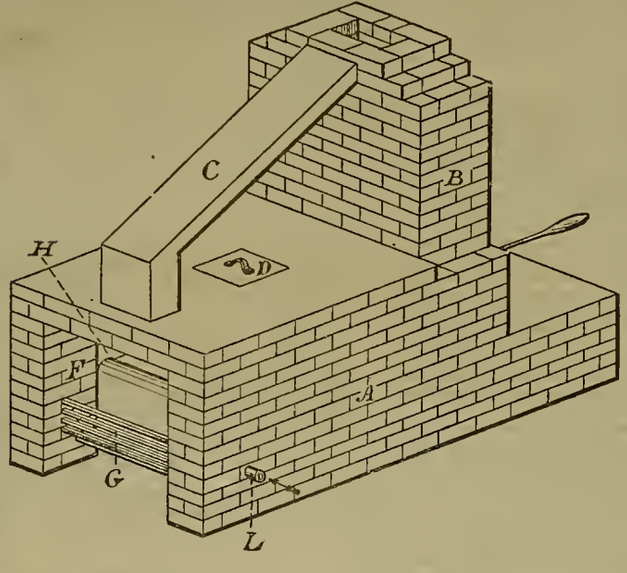

Fig. 2.

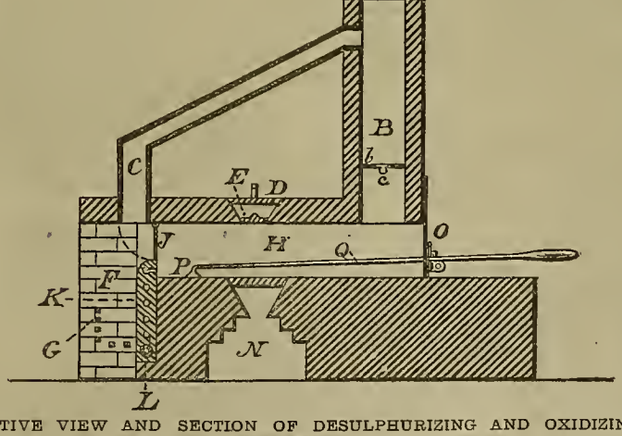

PERSPECTIVE VIEW AND SECTION OF DESULPHURIZING AND OXIDIZING FURNACE.

MEN EMPLOYED.—The following number of men are employed in the Standard mine: 80 miners, 17 carmen, 2 skipmen, 4 laborers, 4 watchmen, 3 station tenders, 3 blacksmith helpers, 3 firemen, 4 tramwaymen and 1 timekeeper, at $4 per day; 3 ore-sorters and 2 woodmen, at $3.50 per day; 9 carpenters, 7 engineers, 2 blacksmiths, 1 ropeman, 3 brakemen and 2 shift bosses, at $5.70 per day; 1 chief engineer, 1 boss carpenter, 1 boss blacksmith and 1 pumpman at $6 per day; 1 foreman and 1 clerk.—*Bodie Free Press.*

MANY prospecting miners are striking out into the new districts along the line of the Carson & Colorado railroad. Strikes in that direction are being constantly reported.

Lead Poisoning.

In almost every branch connected with the working of lead the workmen are subject to certain diseases, more or less fatal. Still, it has been shown, even by distary, the ordinary effect of lead can be counteracted, although there are some persons who are susceptible to the effects of lead more than others are, and who, under almost any circumstances, in the long run will succumb to its poisoning powers, more especially if they are attacked after they have been but a comparatively short time at the work. Where, however, persons have been constantly at work for some years, and have not suffered from the lead, it may be fairly assumed that they have become somewhat impervious to its deadly effects. Several deaths have lately occurred in the north of England from lead poisoning, notwithstanding the fact that the best known safeguards for securing the health of the work-people had been taken by the owners of the works; and this leads to the question whether there are any antidotes for preventing lead from seriously affecting the health of those engaged in its manipulation.

At Hebburn, on the Tyne, there are extensive works where the desilvering of lead is carried on by Pattinson's process, and where white lead is made on an extensive scale. In the latter branch in particular a good many females are employed, some of them in putting the lead through the rolls; but with respect to all of them most stringent regulations are laid down, so as to prevent the lead affecting them in any way. There are baths and lavatories which the females are obliged to avail themselves of at certain times, for it is considered that the hands should be frequently and thoroughly cleansed several times a day, and that all should bathe at least once a week. In addition to these necessary appliances, provision is made for a supply daily to all hands of milk, beer and acidulated drinks used for the purpose of washing out the mouth and counteracting the deleterious effects of the lead, whilst respirators were also provided. But the rules made in the interest of the women were frequently evaded by many of them, especially as to the bathing, although persons were especially appointed to see that the rules were fully carried out. Yet it is stated, on high medical authority, that were the rules fully adopted, such as we have described, there would be very few what are termed "lead cases."

As to the antidote, the London *Mining Journal* says: We are told that at our large works, where both Englishmen and Scotchmen were employed, the former, who lived a good deal on fat meat and fatty matters, were much less susceptible to the effects of lead than those whose dietary was largely composed of oatmeal. At some of the works on the continent, where the lead workers were at one time subject to palsy, colic, pains in the bones, and ending with convulsions, the usual attributes of lead poisoning, these soon gave way when the employees began to feed largely on fat meats, especially before going to work in the morning. At one place, where a great deal of lead work was done, and where at one time there were the usual attacks, a change was made in the dietary, and cheese, butter, bacon, pork, lard, and other fatty materials, having been the principal articles of food, no person, it is said, was attacked with lead colic for a period of upwards of 15 years. There is here a most important problem for our medical men to work out for the benefit of a large class of persons engaged in an employment that has hitherto been attended with a very high annual death rate. There is a strong belief that lead poisoning can be effectually prevented, and what is, therefore, required is the laying down of certain simple rules as to dietary, sanitary and other requirements, that will have the effect of making lead workers as little liable to diseases most frequently ending in death as persons who have to deal with other minerals that are equally as deadly, but in which there is a much less annual death rate.

THE State Immigration Association is receiving daily a great number of letters of inquiry.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Lumbering in the Mountains.

Editors Press:—While our people generally understand that our lumber is cut in the mountains in this State, I apprehend that few realize the enterprise required and the hardships attending the cutting and getting it out of localities where good saw timber can now be had. The timber suitable to make good lumber has long since been cut off the foothills, where the timber was easy, or comparatively easy, to get at, and the mill men are now forced to go further back into the mountains, where the canyons are very deep, and hills very steep and rugged.

I had the pleasure, a few days ago, of visiting the extensive mills and yards of Towle Bros., Dutch Flat, Placer county. There are three brothers of them, the oldest of whom, I suppose, does not exceed 45 years old. I am told they came to California (like most of us) without means, but had minds to work, and had (as subsequent developments have shown) plenty of pluck and energy. They, in common with other Californians and business men, have had their reverses, losses, hardships and trials; but, amid adversity or prosperity, they have always maintained a steady purpose, an unwavering integrity, as well as great energy. They were always, and are still polite, courteous, generous and accommodating, as well as honest. They commenced the lumbering business about the year 1859. Their first mill was a small water mill, cutting 3,000 to 4,000 ft. per day. Their next venture was also a water mill, but of larger capacity. This was near Dutch Flat. The next was a still larger mill, on Canyon creek, above Alta, near what was then known as Zerr station, on the old wagon road. Next, they had a large steam mill at Cisco. Thence they went to Donner lake, during the time of constructing the Central Pacific railroad over the mountains. Here they built a mill of large capacity, and cut ties and shed timber for the railroad. From there they came back to this side and purchased a large mill on Canyon creek, above Alta, and near where their principal yard, office, store and factory are now located, on the line of the C. P. R. R. Next, they built another mill still higher up the creek, and from that to their present mills, four in number—one near Emigrant Gap, the other three in Placer county, above Alta, located from two to ten miles from the line of the C. P. R. R.. These are reached by a narrow-gauge railroad, which they have constructed over and through hills and canyons so steep and rugged that men of less enterprise would hardly have dared to attempt the construction of a mule trail. I have often traveled over rough country on railroads, but I think I have never seen as great a feat of engineering as this narrow-gauge road. They have now in operation about 15 miles of this road, and are this summer constructing several miles more. They use about 50 cars and three locomotives. These roads are for drawing logs to the mills, and lumber from the mills out to the station or main line of the C. P. R. R. It is there loaded onto wide-gauge cars, and sent to market. Besides these cars and running locomotives, they have several stationary engines at different points along the line of their road, for drawing logs up out of steep canyons; they have tracks laid from these engine houses down into the steep canyons. In places, I should think the grade would equal an angle of 45°; the logs are snaked and drawn on tramways and skid roads to the lower end of the track in the gulches, and there loaded on cars and hauled up these steep tracks to the stationary engines, and from thence drawn by the locomotives to the mill. Their four mills have a capacity of 100,000 ft. every 12 hours.

Towle Bros. have in use about 150 oxen, 30 to 40 head of horses and mules; used last year about 750 tons of hay and 250 tons of barley. They are now working about 300 men, and have six or seven boarding houses in the mountains. They not only work up the raw timber on their lands, but work up the residue into wood and bring that out of the mountains on their railroad, same as their logs and sawed timber. They also have at Towles' station, near Alta, a large factory, where they manufacture, on an extensive scale, doors, windows, sash, blinds, mouldings, turning, fruit boxes, etc. They have eight telephones and 15 to 18 miles of line, reaching to their several mills and logging camps and also their residence and office at Dutch Flat. They are still enlarging and extending their business in all its departments. They say they now have timber enough to run them 10 years to come. They have branch yards at Newcastle, Wheatland and Tucson, Arizona. Notwithstanding their extensive facilities for getting out building material, they have not been able at all times to fill their orders. To be at their station on the C. P. R. R. for but one day and see the large force employed constantly in loading cars, one would naturally wonder where it could all be going to. Robt. Williamson.

Dutch Flat, June 23, 1882.

Safford District.

A correspondent of the Salt Lake *Tribune* writes as follows about this new district: Safford is a new district south of the Humboldt river, five or six miles below Palisade. The mines were discovered about a year ago. The country is trachytic, the hills worn down and covered with debris for the most part. It is near the river on the old emigrant road from Thousand Spring valley to Gravelly Ford. There is no wood, but there is fine water power, and wood and timber could be had at fair prices from the Sierra Nevadas. There are several locations, the Key West, Mohawk, Zanola, Contention, etc., upon some of which they are down 100 ft. or so; on others, less. Very rich ore, chloridee and bromides, is found in all of them, the gangue being baryta, iron, plumbago, etc. The ledges are four or five feet wide and have rather a north and south trend. At first the ore seems to be free, and perhaps most of it is free, but there will be sulphurets with depth, and very probably lead. The Zanola is 30% to 50% lead, and has improved from nine ounces on the surface to something like the Wood River lead richness at a depth of 50 or 60 ft.

The Onondaga is the most prominent location. It crops out strongly in three ridges, perhaps 75 ft. from outside to outside, the presumption being that they may come together below. No one would look at the burnt, black ore a second time, but 33 tons of it taken equally from three openings on the different outcrops and from the very surface and sent to this market, sampled 92 ounces per ton, which is a very good test. Capt. Tyson, formerly in Salt Lake, came up from San Francisco to test it, and he and Al. Patrick put up some money and took a bond on the Key West, which they are sinking on, and finding some ore of very fine grade. He found the owners of the Onondaga throwing away their ore, and actually selected 10 tons of that which sampled as above from the waste dump. A sample across the face of the blow-out at discovery, 15 ft. in width, assayed $20, all silver.

In some respects it is a good-looking prospect. One would want to determine if it went down in such a burnt-up district, and also thoroughly test the strength of the ledge and for what thickness it would yield, say $40 or $50 a ton. There is no lead in this. It is supposed to yield free milling ore. One would like to see a different formation within a reasonable distance, but it is the same kind of country as the Comstock, trachytic, porphyritic, and some of the ledges look as though there might be porphyry on one side and trychite on the other. The writer is not enough of a rock sharp to commend or condemn the country. The proof can only be found by testing it. The appearances about the Onondaga are certainly favorable enough, taken in connection with the character of the ore shipped here, to warrant a testing of the ores, and if satisfactory, the thorough prospecting of the ground.

The Central Pacific railroad lands one at Safford's house on the river. A ferry takes you across, and after tramping through the loose surface of the hills three or four hours, there is an elegant place, just above the ferry, for a dip in the Humboldt. A mile or two up the old emigrant road spoken of is a little town named Cayuga. Cut on the chalky cliff by the way are the names of men who, just 30 years ago, passed through the then terra incognita to the Golden Gate, or where rolls the Oregon, in search of the golden fleece. How many of them have ever returned? But the last sheep is just as sweet in El Dorado as in the dear isles of Greece, or in the strong, sturdy land of the Iroquois, and in that sleep those who found the yellow dust in plenty lie side by side with those who did not.

What Prospectors Find on Pan Cake Mountain.—Maurice Hartnett and Alexander Fraser left town recently on a trip to Pan Cake mountain, being induced to make the trip by the report of a coal-burner that he had found a good ledge of ore about eight miles south of the Eureka and Hamilton road, and about midway on the Pan Cake range. These gentlemen went out and returned home in a few days, bringing with them some specimens of ore which look well, and assay $110 in silver and show a trace of gold. The specimens are taken from the croppings in place, there being no float. Not enough work was done to determine the width of the ledge. Nothing was done but to bound the claim, to put up monuments and do a little work in the center. There is plenty of wood in the neighborhood, the hills being covered thick with small cedars. There is but little water near by—only a few small springs. Messrs. Hartnett and Fraser also brought in with them several specimens of rock taken from the western cap of the ore belt, which have imbedded in them well-defined fossilized remains of huge and insects. The claim located has been named the Palma. Two men will be put to work on it right away.—*Eureka Sentinel.*

How little do the humdrum dwellers in dusty valleys and demoralizing cities understand or appreciate the brave and venturesome men who discover and open the great mines of these mountain ranges. One has to meet them upon their native heath to witness their self-denying, perilous labors; their readiness to face death when imperilled, comrades call for the sacrifice, to partake of their hospitality and be impressed with their general intelligence in order to place them in their proper position as first-class American citizens.

A Hint to Prospectors.

The following sensible article we take from the Ketchum *Keystone:* We have never advocated the giving away of anything, unless, perhaps, we except a few occasions when charity made the demand, or a man had a contagious disease that didn't fit him, therefore we think we can be allowed to give the prospector a hint or two without being charged with acting from selfish motives. During the past 20 days there have been a number of capitalists on the river in search of investments in the way of prospects, but, we regret to state, without much success. Now, why is this? Is it because they did not offer what properties are worth, or is the prospector to blame? A fact or two will enable the reader to form his own conclusions. There are, perhaps, somewhere in the neighborhood of a thousand prospects on Wood River to-day that are more or less promising. Five hundred of these are in the market; but how many buyers have been in the field this season. We doubt if there have been 25. According to this estimate there is, on an average, only one buyer to every 20 claims offered; in other words, the prospector stands only one chance in 20 of consulting a buyer, and when his man comes along what is the result. In many cases it is like an instance which occurred here one day last week, which we will cite: A middle man learned of a prospect not far from Ketchum which was offered at $1,500. He consulted the owners and they agreed to accept this sum for their claim. He then reported to his principal and the price was accepted. Returning to the owner of the claim to make the transfer, he was informed that nothing less than $6,000 would buy it. Other parties then endeavored to make the purchase, and within 24 hours from the time the claim was offered at $1,500, its owners jumped it up to $40,000. There had not been a stroke of work done on it in the meantime, nor had any new discoveries been made. The advance was simply the result of an inkling that a rich operator was after the property. There was no sale, of course, and an expert who has since visited the property affirms that $1,000 is a big price for what is in sight. Now, if the prospector does not wish to sell, let him say so. If his property is in the market let him name his price and stick to it. Just such work as that mentioned disgusts the very men we all desire to have interested, for in a large measure the development of the country depends upon their capital. If the possessor of a claim has faith in his property and is able to work it, by all means do so. We have always advocated this. If not able to develop it, why not sell out or take in a partner who is able to go ahead and ascertain what there is in the prospect? The death-like grip with which many possessors of mere gopher holes hang on their claims, and with no intention of either selling or developing, except, perhaps, just enough to make their title hold in the eyes of the law, is disastrous to the progress of the country, and sure to end in starvation for the owner. A man might just as well own a farm and refuse to work or sell it, or permit others to make it a source of income to him. There are dozens of good prospects within a few miles of Ketchum that to-day ought to be turning out a revenue for somebody.

Prosperity in Arizona

Arizona is now very prosperous. Mining, our greatest industry, was never before carried on with anything like the success that, to-day, attends it. Go where one will, in the mining regions, you will find men, mills, furnaces, etc., hard at work and in full blast, as the saying is. In spite of all drawbacks, Cochise county continues to draw enconiums from the world at large, on account of her astonishing production of the precious metals. The great Silver King, and other mines in Pinal, Gila, Pima, Yuma and Graham counties are yielding gold, silver and copper in abundance.

Counties north of the Gila river, which, owing to isolation, on account of lack of railroad facilities, have not, until recently, cut much of a figure in a mining way, are now coming up handsomely. The Atlantic & Pacific railroad will soon traverse all but one of these counties. It is now within easy distance of many of their best mining camps, and will, next fall, be in the vicinity of the Colorado river. Maricopa county is far south of the line of this road, but has the good luck to be pretty near the Southern Pacific. Besides mining, the grazing, lumbering, farming and other interests of Arizona are prosperous. People, mostly from the East, are every day coming here and making it their home. So that the once much-maligned Territory is on the high road to Statehood.—*Courier.*

The Globe *Chronicle* of June 17th says: The old Globe copper smelter started up in splendid style, and ran out about 11 tons of ore in a short while, when it was reported "she was frozen up." The difficulties causing the stoppage were remedied in a half-dozen hours, and during Thursday night a run of copper bullion was made, and the run still continues. There is no doubt that the ore of this mine is remarkably rich, and that the ore dump, which is very large, as well as the ore in sight, will average a large per cent. per ton in copper, and, like the [illegible] opinion, is beginning to show up a considerable percentage of gold. The Old Globe copper company promises to be a great success.

American Fork Canyon.

A correspondent of the Salt Lake *Tribune* says:

The wagon road up American Fork Canyon is kept in very good repair as a toll road, and on a clear, cool morning of last week, two tramps followed its zig-zag course by the swollen mountain stream for about 14 miles, to the mouth of Evans' gulch. Now, this gulch has been a great attraction for miners, not so much on account of what has been actually found there, but for indications of what is hidden away in its steep mountain sides. Bowlders of high grade silver-lead ore have been found among the debris brought down by the foaming torrent that leaps in angry haste over perpendicular fall and swift-descending rapids. The gulch heads far up on the now snow-crowned summit, from which the famous Silver Bell mine bears in a northwest direction about three-quarters of a mile.

Each mining tramp, as he picks up here and there among loose rocks, the scattered fragments of beautiful ore, nerves himself for the awful climb with the illusive hope that he carries the key that shall unlock the hitherto undiscovered great vein of the gulch. So, after smoking the pipe of peace as a conciliatory burnt sacrifice to the genii of the glen, we adjust our packs, and with quick breath, many slips and some falls, wend our weary way toward the summit.

Like the man with the muck rake in "Pilgrims' Progress," our eyes are turned earthward, although, unlike him, our steps tend heavenward. Eureka! We have found it! The dark purplish rock is cracked open, and the steel-blue galena glimmers and winks at us from its rocky setting. A tender-foot would have considered his fortune made, and the specimen a key to the combination lock of the treasure-house at whose threshold he stood. Not so with the old stagers who have prospected the mountains more or less for 10 years and haven't found 10 Ontario mines in all that time. An hour's digging settles the question. The ore-bearing rock has no roots! It is a waif torn from its original, undiscovered home and lodged by the wayside.

We sit down amid the fragrance of wild flowers, and the singing of birds, and the mocking laugh of the waterfall at our pains, theorize as to the starting point and devious path of the wandering transformed into rich mineral that lies blinking at our feet. Suddenly a boom, a jar, resounding echoes leaping in and out of the cliffs, and we are on the lookout for descending specimens that may be hunting us in a way we hadn't bargained for. The omnipresent prospector, following in the wake of the last avalanch, is ahead of us, and the thunder of his blasts, like a bull in a china shop, is smashing things generally.

Gold-Bearing Clay.—The Nevada (Cal.) *Transcript* says: Wm. H. Smith, the grocer, recently purchased from some Spaniards, for $325, a claim on Bush creek, three miles west of town, and having disposed of a sixth interest to Dan S. Baker, two men were put to work this week sinking a shaft. At the end of two days they brought in eight pounds of clay, containing about $150 worth of gold. The gold-bearing deposit is a stratum of clay varying in thickness from an inch to a foot, and having stringers making into it at frequent intervals, and giving rich pockets at the points of contact. There is no quartz in that locality, but several remarkably rich clay seams, the same as Smith & Baker's, have been found there. Twelve years ago a Brazilian, named Lopez, took out $14,000 there in a short time from a similar deposit. Since then John Curry found pockets containing in all $9,000, and Mr. Green has cleaned up $1,400.

A Natural Pyramid of Copper.—Among the many interesting specimens of ore designed by Arizona miners for the Denver Exposition, the one about to be shipped by the Copper Queen Co. will certainly occupy a foremost position. The specimen in question is one solid mass weighing two tons. It is of pyramidal form, about eight feet high, and two and a quarter by three feet thick at the base. On one side, about midway between the base and the apex, is a recess—the only interruption in its symmetrical shape. At this recess is a miniature cave 16 inches deep, 7 inches high and 9 inches wide. It is in the form of an assayer's muffle.—The sides and roof are covered with beautiful stalactites. The carbonate ore of which this peculiarly attractive piece is composed assays from 23% to 25%.

Borax.—Some 13 of Al. Robinson's pack-mules are engaged in packing borax from the western edge of Death valley to Wild Rose, on the eastern side of Panamint valley. He has arranged to bring out 45 tons per month. The material is in a crude state, but is said to be of a very high grade, and will be sent to San Francisco in the form in which it is found. We do not know the name of the company or owners, except that Mr. Harmon is their acting agent. It is not, however, the Coleman company.—*Inyo Independent.*

Dividends paid for May were $1,523,500, making a total since January 1st of $5,702,100. Of the May dividends, $213,250 was paid at San Francisco, $516,250 at Boston, and $794,000 at New York.

Mechanical Progress.

Thinking and Working.

Many peonlo, workmen, as well as others, fall into the error of supposing that no brain work is necessary or desirable in mechanical labor. It is found that by going through a certain number of physical operations, the manufactured product is turned out; that these movements become, after a time, so easy that they are performed almost automatically, and that it is only by practice that perfection is attained. For these reasons it is thought that all a person needs in his work is the education of the eye, ear or hand, and that, by the training of any or all of these, a person arrives at the proficiency which is indicated by the term "skilled." It is undoubtedly, true that no amount of thinking will enable the steel-worker to tell when the metal is heated to the proper degree, and that it is only by the readiness of the eye in detecting the heat by the color that proficiency in this direction is acquired. No amount of brain work can take the place of that exquisite sense of touch which enables the file-maker to make the lines upon his steel so numerous that they can scarcely be counted by the unaided eye. No amount of learning can locate for the engineer the defective working in his engine which his acute sense of hearing discovers, and in very many other lines of industry the degree of accuracy which is attained, solely by constant repetition of the work, is very wonderful.

The question is, however, whether, in these very departments, the mechanic would not increase his value, both to himself and employer, were he to think while performing his work. It is certain that he would, by the use of his mind more perfectly, honor the nature of which he is possessed. The power to think is given by some writers as the distinguishing characteristic which divides man from the brute creation, and, if this be true, it ought not to satisfy anyone that he is able to perform his work in that perfunctory manner in which the horse walks in the treadmill. If he does no more than this, he is an automatic machine, which needs only to be wound up and set in motion in order for it to perform the work for which it was made. It is this stolid satisfaction with which one regards the product of his labor, which prevents many from bettering their condition and from becoming of any other value to their day and generation than that which is estimated by the daily out-put of their handiwork.

We do not think that a man should despise his work, or that he should be satisfied with anything short of his utmost capabilities in this direction, but we do believe that workmen, while they continue in the foundry or shop, should be valuable members of society, by reason of their intelligence and influence. They need not gradnate from their trade to be as much esteemed as any other class of persons. In addition to this duty that he owes to society, the workman should be a thinker, because it is by the exercise of his mind while at work that he may devise an improvement in machinery or a new use for material which will be an advantage to all, at the same time that it materially advances his pecuniary interests. There is no place better adapted to the exercise of inventive talent than the workshop, and no man can use it to better advantage than he who, by his practical knowledge, knows what can and what cannot be accomplished by a combination of the five mechanical powers.

Had all workmen labored only with their muscle, and allowed their minds to be inactive, the world would not now be reaping the benefits or enjoying the pleasures of many of the mechanical inventions of our day. Neither is there anything in the peculiar surroundings of mechanics which prevents them becoming as intelligent as any other class in the community. It is not possible, nor indeed desirable for men to take books with them at their work, as Elihu Burritt did, but, by a judicious course of reading after working hours, they may acquire food for reflection which will keep their minds active throughout the day. Thought rules the world, and we see no reason why the laboring classes should not be as regal rulers in this scene as any. Thinking and working combined will make of them a power, and will so change their position that the possession of wealth, and honor, and influence will no longer be bleesings to be enjoyed by an exceptional few of their number.—*Industrial World.*

An Electric Flat-iron.—This novel flat-iron is chambered out near its smoothing face, forming a cavity for the reception of an electrical resistance, the latter being connected by suitable wires with a galvanic battery. The face of the flat-iron is heated by the radiation from the electrical resistance. A layer of non-heat conducting material is placed above the cavity in the iron, to confine the heat to the face of the iron.

Rotary Files.—A Connecticut mechanic has made a trial of rotary files for finishing planed surfaces. He is of the opinion that quicker and truer work can be done with these than with hand files, and that the surface is in better shape for truing with the scraper. His experiments have been confined to the planer, but he believes that his device may be properly and economically adapted to the lathe and milling machine.

Sparks from Cast-iron Gears.—In regard to the question whether the friction of cast-iron gears will produce sparks, a subject previously mentioned in our columns, a correspondent of the *American Miller* writes as follows: I once had a pair of miter wheels running in the pit of my burst frame, driving two pair of runners. They were small wheels, some 2 feet in diameter, with about 7 inches face, both of them having the same number of cogs. One of them was on the upright shaft, it not being true on account of its having a coupling off. I took them apart in order to have the toe of the upright shaft worked on, and I forgot to number the cogs. I had been running them some time, and they had worn with shoulders. I kept them well greased; a pretty large pile of grease had accumulated right under the wheels. After having the toe of the shaft repaired, I put them in gear again and started them to work. Having failed to put the cogs in the same places as they were before, it caused them to come in contact with the shoulders, and, the friction being heavy, it caused them to rub or grind out sparks, which set the pile of grease on fire, and would have burned the mill if I had not discovered it in time. I have very little doubt but that a great many mill fires may be traced to the throwing of sparks by gears. There was no possibility of a fire starting in my mill except by these wheels. The insurance companies are laboring under a very great mistake if they think that cast-iron gearing will not produce sparks, and the fact above mentioned should be known among machinists.

A Novel Steam Engine.—A new steam engine, in which the use of steam is economized, and in which a constant equal pressure or strain upon the driving shaft is secured, has recently been patented. The invention is an improvement in the class of steam engines, having more than one movable piston working in the same cylinder, each of which is separately connected by the crank shaft. The cylinder of the engine has three pistons, the rod of the central piston passing through the center of the inner piston. The rods of the outer piston pass through the inner piston, and are secured thereto at equal distances from the rod of the center piston. These rods also pass through, but are not attached to the central piston; and by this construction the movement of this piston is steadied, and it will be seen that the movements of the outer and inner pistons are made synchronous. When steam is admitted through the port between the central and outer pistons, they will be forced apart in opposite directions until the exhaust port allows the escape of the steam, when the steam is admitted between the central and inner pistons, and the central piston moving in one direction while the end pistons move in the opposite, and as the cranks of the central and end pistons are set opposite, it will be seen that by the movements of the three pistons the crank shaft is at the same moment pushed and pulled in opposite directions, and the strain upon the crank shaft is equal in both directions.

Screw-Drivers.—Most people who use screw-drivers must be occasionally inclined to use strong language at their persistency in slipping out of the nick and their refusal to go into it. All that is wanted is a short tube, big enough to enclose the screw-head somewhat tightly, but only spring-tight, so that it may rise as the screw-head comes near the wood; also, to provide for heads of different sizes with the same driver. All this can be done by just turning up a strongish tin tube three or four inches long, like a slate-pencil case, big enough to slide over the widened point of a round screw-driver, and then fitting spring-tight on the shank by means of a piece of leather wrapped around it; and for larger screws than usual, take the socket off and put a larger one on, with a thicker piece of leather. You need not even look at your screw, but just put the tubed screw-driver on end turn. It will drop into the nick at the first half-turn, and stay there till the screw is screwed home.

Pressures in Boilers at Sea.—There seems to be no limit at the present time to the increased pressures used in boilers at sea. It is said that a new steamer building for the French government is to be fitted with engines intended to utilize a working pressure of 142 lbs. per square inch. They are expected to indicate 3,800-horse power. The boilers to supply steam are of a pattern which has already been tried in a government dispatch boat, and it seems that they are entirely satisfactory after several years of use. It is expected that these boilers will be able to furnish steam for the engines without forced draft.

Acid in Machine Oils.—One of the simplest and readiest off-hand methods of detecting whether a sample of machine oil contains free acid, is to cover some oxide of copper in a glass with a layer of the oil (coppersmith's ash will answer the purpose. If the oil contains either free, fatty or resinous acid, the cuprous oxide will be attacked, and the oil will show in a short time a distinct green coloration. Gentle heating facilitates this action.

Steel Driving Belts.—A patent recently granted in Vienna and Berlin uses bands of steel, which are tempered and hardened, to transmit motion from one pulley to the other, the faces of the pulleys being turned perfectly flat and then faced with a varnish of rosin, shellac and asphalt.

Scientific Progress.

"Water Hammer" Action in Earthquakes.

In a recent paper on the causes of volcanic action, Prof. Prestwich assumes the existence of hot reservoirs or cavities filled with molten rock, and cold reservoirs or cavities, nearer the surface, filled with water; and he supposes the shrinkage of the earth to squeeze up the molten rock till it meets with the water, which then explodes, producing a volcano.

Mr. Thomas Mudd suggests, in the *Geological Magazine*, that the conditions described by Professor Prestwich must give rise to the "water hammer" action familiar to engineers. Water hammer action manifests itself when steam has to be conveyed to considerable distances from its source without any return communication or easy vent. It occurs in this way: The steam, on being turned into the cold pipes, is quickly condensed, and in a short time a quantity of water is formed. The steam condensing most quickly at the end furthest from the inlet, there is there formed a partial vacuum. The steam, rushing forward in consequence, gathers up the water into a plug, which fills the sectional area of the pipe, and forms, indeed, a water piston. This water piston is dashed by the force of the steam against the end of the pipe, producing a severe shock, accompanied by a loud report; and then follows, by natural sequence, a rebound, which must be a rebound of a compound character, made up in part of the rebound of the steam, in part of the rebound of the water, and in part of the effort of the water to regain its level by gravity. The first two are probably of momentary existence, but the last takes time, and proceeds with a measured swing like a mighty pendulum. When the force of the return wave is spent, and the steam again gets the advantage, condensation having in the meantime been going on behind the return wave, this piston of water advances a second time, and is dashed with increased fury against the obstruction in the pipe. This action, in a few strokes, arrives at its maximum, and thence, if the pipe has been able to withstand the shocks, gradually diminishes and dies away.

Diastase in the White of Eggs.—It is well known that malt contains a substance capable of converting starch into sugar, to which the name of diastase has been given. A substance resembling diastase has been discovered in the albumen of the egg by F. Selmi, the original discoverer of ptomaines, or poisonous alkaloids, in dead bodies. Previous to his death, in August, 1881, he wrote the following letter to Ercolani: Various considerations have induced me to assume that egg albumen contained a body that would change starch into sugar. In fact, I found that a filtered aqueous solution of albumen, when digested with a solution of soluble starch, induced this change very rapidly. This confirmed my suspicion, and I attempted to isolate this body from ordinary albumen. This I succeeded in doing by treating the albumen with three parts of water and precipitating the solution with a sufficient quantity of concentrated alcohol. The diastatic substance is in the soluble portion of it, as I was able to prove by experiments, by redissolving the albumen that had been precipitated, and making comparative experiments with that and with the substance that remained in solution after expelling the alcohol at a low temperature. The existence of a diastatic substance in egg albumen is of great physiological importance, which may be stated as follows: The albumen contains glucose, and the yelk of egg contains starch; the latter is changed into sugar when it reaches the albumen, and is thus converted into nourishment.

Ammonia from the Nitrogen of the Air.—Many efforts have been made by chemists, with indifferent success thus far, to produce ammonia by utilizing the atmospheric nitrogen. We lately described an English process intended to accomplish this object, and may now add another from a French source which looks very reasonable on its face. The process is thus described: In this operation metallic zinc is employed to set free the elements involved in the reaction, and titanic iron to effect their union. Molten zinc falling into a body of water liberates hydrogen, oxide of zinc being formed. A stream of air passed over spongy titanic iron results in the absorption of the atmospheric nitrogen; and when the hydrogen liberated in the above-named reaction is passed through retorts containing this spongy iron, the nitrogen is liberated from the titanium and unites with the hydrogen to form ammonia. The oxide of zinc formed in the reaction is afterwards reduced in retorts by mixing with carbon and heating and distilling in the usual way, and the carbonic oxide formed in the operation is burned to carbonic acid, and made to unite with the ammonia to form the carbonate. Or, in place of using the spongy iron, platinized pumice or charcoal is substituted for it, and the gases are made to act upon it under moderate pressure.

The Sun's Heat.—In a paper read by Dr. C. W. Siemens before the English Royal Society lately, the ground was taken that all the heat and energy sent from the sun find their way back to the great solar center, which thus suffers no diminution of its forces.

Absorption of Metallic Oxides by Plants.

Prof. F. C. Philips recently read an interesting paper before the Engineers' Society of Western Pennsylvania, treating upon the absorption of metallic oxides by plants. The paper contained the history of what is known and thought about the effect of metallurgical works on adjacent vegetation, and the influence of poisonous oxides in the soil. A summary of experiments was added, made upon a great number of young plants, with the object of determining whether any injurious effects are produced upon them by being grown in soil impregnated with certain metallic oxides, and whether plants in a perfectly healthy condition will absorb such oxides through their roots.

The following conclusions were arrived at: 1. That healthy plants, grown under favorable circumstances, may absorb through their roots small quantities of lead, zinc, copper and arsenic. 2. That the lead and zinc may enter the tissues in this way without causing any disturbance in the growth, nutrition and functions of the plant. 3. That compounds of copper and arsenic exert a distinctly poisonous influence, tending, when present in large quantities, to check the formation of roots, and resulting in the ultimate destruction of the plant, or in the reduction of its vitality to such an extent as to interfere with the nutrition and growth. In the case of the heavy metals, copper, zinc, arsenic and lead, it seems to be probable that their oxides may, under certain circumstances, become deposited in the tissues of the plant.

Electric Current Produced by the Action of Light.—The following account is given of Mr. P. Laur's experiments in relation to the above: A glass vessel is placed in a dark chamber and filled with a solution of 100 parts of water, 15 of common salt and 7 of sulphate of copper. A porous vase filled with mercury is placed in this solution, and two electrodes, one of platinum and another of sulphuret of silver, are inserted, the first into the mercury, the second into a cuprio solution. These two electrodes are connected with a galvanometer; the apparatus is placed in the sun and the dark chamber shut. As soon as the circuit is closed the galvanometer needle turns in a direction which shows that the silver sulphuret is positive; when the needle comes to rest the shutter is opened, and the needle is immediately repelled, soon coming to a new position of equilibrium; on closing the shutter again the needle slowly retrogrades toward its first position. When the needle is placed in the open air, if a cloud passes before the sun the movements of the needle show the variations of luminous intensity. The movements are attributed to the reduction of the silver sulphuret by the cuprio protochloride, a reduction which takes place only under the action of the sun's rays.

Chemical Analysis of Tissues.—For the detection and quantitative estimation of silk, wool, linen and cotton fiber in tissues, the following process is recommended by Remont: Four samples of the questionable tissue, each weighing about two grams are taken, and three of them are immersed in diluted muriatic acid containing about three per cent. of the latter. Two of these samples are boiled with basic chloride of zinc, and one of them with a solution of caustic soda. The four samples are now dried and weighed. The difference due to the substance dissolved in muriatic acid is equal to the amount of starching and coloring matter; the amount of silk is shown by that portion dissolved in chloride of tin, while that soluble in caustic soda stands for wool. That portion insoluble in any of these agents is considered as vegetable fiber after five per cent. have been added to the same, which experience has shown to be an unavoidable loss. The solution of basic chloride of zinc is obtained by dissolving 1,000 parts of molten chloride of zinc in 850 parts of water, after which 40 parts of oxide of zinc are added.

A New Theory of the Formation of Coal.—After a protracted microscopic study of coal, Prof. Reinch has come to the conclusion that coal was not derived from land plants, but chiefly from microscopic forms of "a lower order of protoplasm." He holds that plants of a higher order have contributed but a fraction of the mass of coal veins, however numerous they may have been in some instances. In a recent lecture, stating his conclusion, Prof. Reinech referred to the fact that Dr. Muck, of Bochum, held that algæ have mainly contributed to the formation of coal, and that marine plants were rarely found in coal, because of their tendency to decompose, and that calcareous remains of molluscs disappeared on account of the rapid formation of carbonic acid during the process of carbonization.

Color Printing.—A European firm has patented a newspaper press which, it is claimed, prints in four or five different colors at the same time. It is somewhat similar to presses used in printing wall paper.

Electricity is now employed in the rectification of inferior alcohol, generated by a voltaic battery and a dynamo-electric machine.

Silver is the most perfect reflecting metal, absorbing less than three per cent. of the rays of light.

The Mining Share Market.

There has been very little doing in mining stocks during the past week, the excitement of the holidays drawing attention in other directions.

The following mining companies had cash on hand July 1st: Alpha, $11,207.50; Bulwer Consolidated, $54,983.92; Crown Point, $22,991.71; Consolidated Virginia, $48,569.05; Gould & Curry, $29,018 82; Ophir, $13,733 85; Occidental, $7,464.24; Standard Consolidated, $140,207.42. The following had an indebtedness: Best & Belcher, $2,738.59.

The *Mining Record* reports the product of the Homestake mine for the first half of June at $85,000.

The Father de Smet mine paid a dividend of $20,000 on the 1st of July, and carried forward a surplus of $17,265.

The Mack Morris mine of Arizona has produced $543,000 to date. But it has not produced a dividend for stockholders.

The Osceola Consolidated mining company paid ite 11th quarterly dividend of $1 per share, aggregating $50,000, at New York on the 1st inst.

Suit has been brought hy Thomas Davis, as assignee of P. M. McLaren, against J. D. Roberts and John Pearson for $3,150, alleged to have been promised McLaren by the defendants on condition that McLaren remain quiet and not oppose a settlement between the Woodville and Justice mining companies in December, 1877.

THE North Bloomfield hydraulic company, in Nevada county, has commenced the construction of a dam in Humhug canyon, below their mine, to hold back their debris. It is described as a crih dam, heing huilt of large logs firmly fastened together and held in place hy huge howlders and chains. The hight of it when completed will be 50 ft. It will hold all the debris coming from the mine during the next season. When it is filled, another will be huilt helow it and so on as long as there is any gravel to wash.

PLACER mining still continues in the Santa Rita mountains, Arizona, notwithstanding the present ecarcity of water. Most of the work is heing done by Mexicans, they heing satisfied with a less return than the Americans. With the opening of the coming rainy season many claims that are now idle will he worked, and good returns are expected from them.

TRIBUTE WORK.—The Austin *Reveille*, of Jnne 29th says : Four trihuters in one of the mines of the Manhattan company recently had a crushing of 25 tons at the mill, which averaged $750 to the ton. After squaring up their indehtedness they had $9,000 to divide. All trihuters, however, it is nnnecessary to state, do not come ont so well; in fact, many do not come out even. These men have what might he called a pretty good "pitch."

THE *Inyo Independent* has started on its 13th year and volume. The *Independent* can always he relied on for local items, and would serve as a pattern for many larger papers in this respect. We never fail to find something of interest in every issne. It is one of our hest interior exchanges.

Chinese Prospectors and Assayers.

It is an established fact that the Chinese will engage in any occupation in which there is a possibility of realizing the most insignificant profit, however many and great the obstacles may he. Heretofore, the Chinese have confined themselves altogether to placer mining; hnt now they have the quartz mania. For several weeks a numher of Chinamen have been prospecting, in the hills west of Carsou, for quartz, hnt with what success we have been unable to learn. We are also informed that there is a Chinese chemist in Chinatown who makes assays of their samples of rock. Whether the correctness of his assays can he relied upon it is difficult to say; but who ever heard of a Mongolian assayer in this country before? In an interview with an *Appeal* reporter, this Chinaman stated that he came hy his knowledge of assaying in the office of the late Conrad Wiegand, at Virginia, where he had heen for many years employed. He never received any instructions from the attaches of that establishment, hut familiarized himself with the process as much as possihle hy the closest observation. He does not claim only to he ahle to make ore assays, hnt says that he can also determine the fineness of hullion. Upon further inquiry, he remarked that he receives ore samples from Chinese all over the State. These prospectors are heing encouraged hy wealthy Chinese companies in San Francisco, who will devote a part of their unlimited means to the development of any good property that their countrymen may stumhle across. This further demonstrates the fact that the Chinese are honnd to engage in every industry now engaged in hy our people. But this does not henefit us, for every ounce of gold or silver they extract from our soil is shipped to China. —*Carson Appeal.*

THE NORTHERN PACIFIC GEOLOGICAL SURVEY.—Prof. Raphael Pumpelly, who has charge of the Northern Pacific geological survey, arrived in the city Thursday evening The lahors of the geological corps consist in examining the agricultural and mineral resources of all the country tributary to the road from Lake Superior to the Pacific. Hitherto the company has possessed hut little accurate knowledge of these resources. The survey will he prosecuted hy three field parties, each consisting of a geologist, topographer, and snch others as the work may require. The work has, we learn, heen commenced, hoth at the east and the west, hut its final completion will occupy eight or ten years time. All the gentlemen connected with it were formerly of the United States Geological Survey.—*Helena Independent.*

AT ANDERSON SPRINGS, Lake county, the season so far has been a very lively one. Several new cottages, added to the place since last season, have been substantially filled with genial and home-like guests. The hotel and its surroundings have also been decidedly improved, makiog the place more than ever desirable to those who appreciate good home living, unadulterated with worse than useless fictions and fashions. Dr. Anderson, his mother, and several sisters, proprietors of the Springs, give their personal attention to the place. They contemplate further important improvements another season.

ROEBLING, the engineer of the Brooklyn hridge, is hopelessly sick. He has a nervous disorder which haffles all medical skill.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

THE ALPINE HYDRAULIC CO.—*Monitor-Argus*, June 24: In company with Judge Arnot, last Wednesday morning, we visited the Alpine Hydraulic M. Co.'s claim, situated on the banks of the main Carson river, below Hangman's bridge, and about one mile southeast of Markleeville, this county. The company is composed of the following named gentlemen, to wit: Messrs. E. W. Smith, George and A. Wilson and — Greir of Silver City, James Curtain of Virginia City, C. True of Gold Hill, D. Deleven of Sutrn, and D. Starker of this county. This company, after thoroughly prospecting this ground last October, located 160 acres of placer ground, and in the following December commenced excavating a ditch, commencing at the lower end of Pleasant valley, taking the water from the never-failing Pleasant Valley creek. By hard work during the past winter and spring they have succeeded in completing the ditch to their claim. The ditch is about 3 miles in length, 22 inches in depth, with a width of 2½ ft on top and 22 inches on the bottom, and is capahle of carrying 400 miners' inches of water. The pen stock is constructed about 40 ft in hight from the ground, where there is 40 ft of hose attached, leading to the portion of the claim where the company have commenced piping. The pressure from the pen-stock to the place of piping is 100 ft fall, and the water is forced through a 2-inch nozzle with such force that the banks are crumbled and howlders roll rapidly down towards and into the sluices, which are 11 in number and 175 ft in length, which are set with a 16-inch fall. This claim has been prospected for years past by many different persons, all conceding that it prospected well in gold, often getting as high as 50 colors to the pan, but, owing to the amount of labor required in the constructing of a ditch to carry water to the ground, weakened, until the present company took hold and are now feeling jubilant over their undertakings. To say that this company deserves success is not saying enough for their enterprise, but we hope, and are fully confident from what we have witnessed, that this company has a hright future awaiting them not far distant.

THE ORION MINE.—The Orion mining company have their two-compartmeut shaft sunk to the depth of 100 ft below the level of the old tunnel, from which the ledge was cut in 1865. The shaft is timbered with 4-inch plank, and is finished in the best possible order. Drifting for the ledge from the 100 level will be commenced to-day, and we confidently expect to hear of a rich strike in a few weeks. We congratulate the company on their energy in pushing the work forward as successfully as they have. The horse-whim is working well, hoisting from 4,000 to 6,000 gallons of water per day, besides the rock taken from the shaft and drift.

AMADOR.

MISCELLANEOUS.—*Ledger*, July 3: The Jackson mine, recently bonded by Ginocchio Bros., is now down 150 ft. Sinking is suspended at present, and drifting on the ledge is in progress. The ore body is reported to be over 4 ft wide. Mr. Roberts, the manager, went below this week, to see other parties interested in regard to futuro operations. The Tellurium mine and mill are in full swing again, and evidently with a long period of activity in prospect. The hauling of wood and timhers to the Gover has been stopped, which has had a depressing effect upon the wood men. It is understood, however, that operations will be resumed shortly. The Volcano Gold Gravel mining company are still sluicing out their reservoirs, the capacity of which has become materially diminished by the accumulations of sand, etc.

CALAVERAS.

THE FINDLEY AND LOVE MINE.—*Mountain Echo*, June 24: Findley and Love, who have been engaged in working the Doc Hill mine for several months, have been compelled to discontinue sinking, owing to the great increase of water in the shaft. Proper machinery will have to be erected before the shaft can be sunk deeper. They will, however, continue to drift on a line with the water.

THE BIG MINE —The Big mine, adjoining the Doc Hill mine on the south, is still being successfully worked by Potter & Co. The lead continues about the usual width, which is over 12 ft. The ore is being worked by two 9-ft arastras, which are kept steadily running day and night. The average yield of the ore is about $15 a ton.

NEARLY COMPLETED.—George Osborn & Co. have about completed their arastra mill. It is said to be a staunch piece of work. We may expect to hear hig reports from their mine soon.

RICH SILVER MINE.—Perhaps the richest silver mine that has been discovered on this coast for years is the one recently developed on Carson Creek, about 6 miles from Angels, and known as the Jones mine. This mine was first discovered by Dr. Jones & Co., some 20 odd years ago. A large sum of money was expended by them in endeavoring to bring to light the rich treasure they felt confident it contained. A shaft was sunk over 100 ft in depth, and a large body of ore was exposed. Dr. Jones, who was the only one of the company that possessed means sufficient to erect machinery for the proper development of the mine, built a mill, and worked the ore for gold exclusively, not being aware, of course, that silver predominated. It is well kuown to every intelligent miner that in the primitive days of quartz mining, before proper machinery and appliances were invented and brought into use for saving gold, scarcely 10% of the precious metals could be saved. Dr. Jones & Co. worked the mine for some time, the ore yielding an average of $12 per ton in gold. Finally, however, the mill was destroyed by fire, and Dr. Jones, not desiring to entirely exhaust his means, discontinued work, since which the mine has lain idle until, about a year ago, it was purchased by W. H. Porter, viceneral Auditor of the C. P. R. R., who is now working it, and has developed an immensely rich lead of silver ore. Assays have been made from time to time from the vein, which is over 8 ft in width, none of which have yielded less than $30 per ton in silver and $20 in gold. Some assays, however, have gone as high as $500 a ton in silver. It is to be hoped that our citizens will give all possible encouragement to Mr. Porter, who has already expended quite a sum of money among us.

EL DORADO.

SPRING TUNNEL.—Georgetown *Gazette*, July 3: A few days since we had a call from Mr. George W. Lovejoy, a gentleman of mining and milling experience, who has come up for a San Francisco company to operate the Spring Tunnel mine at Volcanoville. Thus another mine is started up in that live and growing camp. Mr. Lovejoy has a good word for the Day stamp-mill.

ACCIDENT.—Henry Ward, who is working with Mr. Linehan sinking a shaft near town, last Tuesday while letting the bucket down filled with tools, the strap broke, when he checked the fall of the bucket by seizing the windlass, which resulted in the fracture of the small bone in his left arm. No one in the shaft at the time.

FRESNO.

GRETTUDE.—Cor. Mariposa *Gazette*, June 24: John R. Bothwell, of New Mork, and Superintendent A. J. Bothwell, of Hite's Cove, have been here the past few days, looking at the prospects of this section. At the King Gulch mine work is proceeding as usual. There are favorable prospects of a mill going up on this mine very shortly. Eight tons of the ore, crushed at the Butterfly arastra, averaged $40 per ton taken as it came from the mine.

INYO.

MINES SOLD.—Inyo *Independent*: It is stated that J. F. Hutchison, Judge Cliff and others, have sold to Eastern men, represented by Mr. Bolinger, of San Francisco, several of the big copper mines in the old Ubehehe district, situated across Saline valley. We are not apprised of the amount paid, nor have the deeds been recorded as yet.

THE LAURA.—At a meeting of the owners of the Laura mine and mill at this place during the week, Judge A. R. Conklin was made superintendent and general manager, with authority to pay all claims and transact all business matters generally. The mill will start up during the coming week, Judge Conklin having gone to Lone Pine to secure the services of a pack-train.

MARIPOSA.

DILTZ MINE.—Mariposa *Gazette* Col. Diltz visited San Francisco last week, for the purpose of gaining information about pipe which he contemplates purchasing, to carry water over some 2 or 3 miles of country to his mine and mill site. His wagon road, about the same length, is approaching completion. The Colonel is pushing his improvements rapidly, and ere another year rolls around the interest of the Diltz mine will be greatly enhanced.

NEVADA.

GREAT WESTERN MINING CO. Nevada *Herald*, June 28: This company is operating on Deer creek, about one mile and a half below the Providence. A tunnel is being run on the course of the ledge, and is now in over 100 ft. The company own 3,000 ft on the vein, and feel very sanguine over their present prospects. The croppings of the ledge can be traced for 1,000 ft The tunnel is of good size 6x8 ft in the clear, and is being strongly timbered with 10-inch round timbers. A recent crushing of ore taken from the croppings 230 ft ahead of where the tunnel begins, paid at the rate of $12.40 a ton. There is at present a 2-ft ledge of quartz in the tunnel, the character of the rock improving as the tunnel is driven ahead. The mine is being worked by a San Francisco company, which has been prospecting hereabouts for over a year past. If sufficient encouragement is met with (and the indications now are very good) a water-power mill will be put up.

PRESCOTT HILL MINE.—*Grass Valley Union*, July 2: The tunnel which has been in progress on the Prescott Hill ledge (the property of the Orleana mining company), under the direction of John L. Smith, the superintendent, has reached a distance of about 1,800 ft, and the header of a tunnel is now directly under the crown of the hill, where a fine ledge of ore is exposed, that shows an average width of 15 inches. In running the tunnel the ledge has frequently been found irregular and small, but is now showing regular in place and of excellent quality. Mr. Smith feels that his long and persevering efforts is open up a fine ledge are at last crowned with certain success.

PLACER.

A BIG CLEAN-UP Grass Valley *Union*, July 2: Hon. J. H. Neff was over from Colfax yesterday, and showed our reporter a portion of a clean-up from the Morning Star drift claim, near fowa hill, Placer county. The gold was heavy and coarse, some of the pieces weighing over an ounce, and comprised a portion of 70 ounces of gold taken out by 2 men in 4 weeks. The channel in the claim is 400 ft wide, and much of the gold is coarse. J. C. and E. Coleman, Mr. Neff, and a number of working miners of Grass Valley, are the owners of the claim. The Morning Star has been worked more or less for the last 25 years.

OPHIR DISTRICT.—Placer *Argus*: There is considerable activity in the mines of Ophir district at the present time. New strikes are reported almost daily, and everybody seems jubilant over the future outlook of the camp.

PLUMAS.

MILL BOUGHT.—Greenville *Bulletin*, June 24: The owners of the Robertson mine, in Genesee valley, have bought from the Savercool mining company the first mill put up at that mine, and will at once proceed to remove it to the new location.

SAN BERNARDINO.

ORO BLANCO DISTRICT. *Times*, June 21: Hon. John Lawshe has just returned from Oro Blanco mining district, which is situated about 9 miles north of Whitewater station, on the S. P. R. R., by Indian trail, and about 16 by the wagon road, at an old Indian village. The mines are situated on a mountain between Mission Creek on the east and Whitewater river on the west. The mountain has an altitude of about 400 ft, and contains large amounts of mineral-bearing rock. The ledges are located within an area of about 5,000 ft north and south, between the two streams; the ledges run parallel with numerous spurs, and vary in width from a few inches to 6 ft. The formation is granite and porphyry, the quartz being a yellowish chloride, carrying both gold and silver, and gives assays from $30 to $125. The dip of the ledge is to the south. There are now 31 locations, upon which, however, only prospect work has been done, but this shows most encouragingly. The principal leads are the Great Eastern, Great Western, Red Flag, White Deer and McDowell, the locaters and owners being George Bailey, Messrs. Smith & Scott, Valentine & Noyes, Alva Warren and Dave Henderson, all of whom have excellent prospects. The Whitewater river, only two and a half miles distant, would furnish ample water power for mill purposes, while plenty of water for mining purposes is furnished by Mission creek. At an expense of about $500 a good wagon road could be made, about 10 miles long, to Whitewater station. Mr. Lawshe thinks that Oro Blanco district will yet prove as good as Cherry itself, and add large y to the reputation of San Bernardino as a mining county and to the wealth of the country.

THE COMBS CAMP.—There are now over 100 men in camp, all being actively employed. The Bonanza King Con. mining company is pushing its work vigorously, under the management of Mr. Gillette. The main shaft is being worked with three shifts, pushing her down rapidly. Connections are being made for air purposes, and several winzes and crosscuts run, opening up the ore bodies. The high-grade character of the ore is almost incredible, the average for the past month being about $400 per ton for all the ore extracted. The hoisting works are now all on the road, some delay having occurred at Colton station for want of freighters. The water supply is all that could be desired, and everything is being put in readiness for the 10-stamp mill, which has been shipped from the manufacturers (Prescott, Scott & Co.) and is now at Mohave station. I understand it has been awarded to Mr. Nadeau to freight it to this place, and, with Mr. Gillette's usual enterprise, we may expect to see the stamps drop some time in August. The quantity of ore that is being developed, with its extraordinary richness, proves this place to be the coming camp. There is more than ore enough on the dump and in sight to keep the stamps busy for a year to come, insuring the lucky stockholders a monthly dividend. I understand that a couple of your townsmen (Poppett & Clark) have shipped a large building for the purpose of opening a place for the refreshment of the inner man. We could conveniently take a cool lemonade at the present moment.

PROSPECTORS.—That indefatiguable prospector, Andy McFarlane, with a party consisting of Doc. Drow, U. W. Pearce and Mart Anderson, arrived here a few days ago, coming by way of Whitewater, being just a month on the road. I have heard that they have struck a nice prospect of copper on the road. I believe it is their intention to prospect another month before returning to their homes.

SIERRA.

THE FIRE.—*Mountain Messenger*, June 24: The loss at the Extension mine was somewhat greater than we estimated last week. Ten thousand dollars would no more than put the works as they were before the fire. The fire caught in the blacksmith shop, and was discovered by some one before it had made much headway, but so inflammable were the buildings that before the alarm could be given the whole range of buildings were in flames. Three sets of timbers at the mouth of the tunnel were badly burned, but a lot of cars standing just within the tunnel were not injured. The company lost only two working shifts, and by Saturday morning they had a blacksmith shop fixed up and were ready to resume dumping cars in the waste dump. The reservoir will be rebuilt immediately and such other repairs as are necessary will be speedily made.

PAY GRAVEL.—The Bald Mountain company have found pay gravel in the shaft sunk in Lowell avenue, and are prospecting to learn the extent of the gravel.

CAVE.—An extensive caving of the bank took place, recently, in the diggings of Mr. McNulty, at Chips flat, covering up nearly all the bottom gravel which had been stripped, and rendering it impossible to get the gold contained therein this year.

BRUSH CREEK.—Work will soon be commenced on the Brush Creek mine, in sinking a new shaft.

THE ALASKA MINE. *Sierra Tribune* A gentleman who went down in Nevada City a couple of days since from Pike City, this county, was interviewed by a *Transcript* reporter, who learned that the Alaska mine was in a very flourishing condition. The present management has been actively at work for about six months past. The first and second levels have been run 500 ft east and 300 west, and each of them show well in good quartz, both in the breasts and stopes. The vein is from 2½ to 5 ft thick, and the pay ore yields from $12 to $17 a ton, with very little sulphurets. At times bunches of very high-grade specimen ore have been found. The shaft is now being put down toward the 350 and 450 levels. The steam hoisting works were originally owned by the Watt M. Co., and are capable of going to a great depth. There is an abundance of timber on the mine. There are 30 men employed under ground, and 20 about the surface. The best indications of the Alaska's success are that it has for four months past paid regular monthly dividends of $1 a share to all its stockholders. We hear that there is no stock for sale in this section. A Camptonville friend who holds quite a block, says he would not take $100 a share for it.

THE RUBY MINE.—The present prospect of the Ruby mine for an early tapping of the channel is of the most favorable character. The company has recently run a drift south from the upper tunnel, starting from a point near the shaft last sunk. Here they encountered the west rim with the bedrock pitching south and east. A gravel deposit was found at this point Saturday, which gave vent to the rumor that the main lead had been found at last. Supt. Wallis of the Bald Mountain paid a visit to the mine Sunday, and his opinion, as expressed to the writer, was that the indications are very flattering for soon reaching pay.

ELECTION OF OFFICERS.—The Bald Mountain Co.'s regular annual meeting was held at the office of the company last Friday, when the following officers were elected to serve for the ensuing year. James McNaughton, President and Treasurer; J. McOregor, Secretary; H. C. Perkins, J. McGregor and James McNaughton, Trustees; H. W. Wallis, superintendent.

THE SAVAGE.—Work at the Savage placer mine is being pushed ahead vigorously. Supt. Ball is employing a full crew of men. The roads are now opened and wood being hauled to the mine for future use.

TRINITY.

CLEANING UP.—Trinity *Journal*, June 24: Miners in Weaver basin and elsewhere in the county are now engaged in cleaning up. Although the water season has been a very short one we hear that the yield will be very good.

NEVADA.

BRISTOL DISTRICT.

NO CHANGES.—Pioche *Record*, June 24: So far as we can learn there have been no changes of note in the various mines and prospects in the hills during the past week.

CLOUD-BURST.—On the night of the 20th a slight cloudburst occurred near the divide, and as water will naturally run down hill through a channel, Bristol resembled a brickyard the morning following, caused by the washing down of tailings from the mill.

ENCOURAGING.—The smelter is running splendidly. Since the starting up of the concern there has been neither break in the machinery nor "cake" in the furnace. The daily yield of bullion is on the increase—some 60 bars coming out per 24 hours it's rich enough to steal—and as this date, the 23d, there are upwards of 24 tons of it corded up and awaiting shipment.

BRISTOL MILL.—The mill did not start up last week owing to the breaking of the pump at the well, but it was expected to start up again on Thursday. The mill is to run on tailings, which has already been demonstrated will not pay. The roaster is being overhauled and is expected to be in order to work in about two weeks, when working one will be resumed. Notwithstanding the sinking of the well to a greater depth, the increase of the flow of water has been very light. It would be money to the Bristol company to put the torch to the old mill, then erect one at some point where a supply of water could be obtained. This was the opinion of Mr. Charles Rose, at the time he was in charge of the mill.

CHERRY CREEK DISTRICT.

MINES BONDED.—White Pine *News*, July 3: We are informed that the series of mines comprising the Mary Ann, Pacific and Flagstaff, in this district, have this week been bonded to Mr. Hurd, of the Teacup Co., for four months. The terms of this bond—as related to us—are that Mr. Hurd's company is to prospect the mines, take out and mill ore during that period, half the proceeds of which is to go to the owners of the mines in case the first payment of $7,000 is not made at the time specified. At the expiration of 12 months after this the property is to be paid for in full, the total amount of which we are not at liberty to state, though it seems a fair price. This series of mines is one of the best in this district, much valuable ore having been taken from them, and much more being in sight ready for extraction. We understand it is the intention of Mr. Smith (the Teacup superintendent) to commence work on these mines in a short time. They are already in fair working condition, situated within a stone's throw of the Teacup mill, and are sure to prove a valuable investment for Mr. Hurd and his company. The starting up of these mines cannot fail to give a new impetus to mining operations in Cherry Creek district.

COLUMBUS DISTRICT.

AUBURN MILL.—Nevada *State Journal*, July 1: The Auburn mill has been leased by the Mount Potosi Con. M. Co., of Columbus district, for a year, and the shipment of ore to the mill has begun. By this arrangement the companies can have its ores hauled and reduced at an expense of $12 per ton, as against $23.25 per ton under previous methods, while a greater percentage of metal can be saved. A large quantity of ore has been accumulated for shipment, and the mine is developing well at various points, under the active management of Captain J. M. Day, and the new Board of Directors. Following are some of the average assays: Tunnel No. 2, west drift $51 85 silver; $4.85 gold; total, $56 60—$135.68 gold, $59.00 silver, 194.75. Back ledge—gold $5 to $20; silver, $200 to $300. Tunnel No. 1, front ledge—silver $50 to $100, gold $5 to $70. Tunnel No. 1, back ledge—silver $250 to $1,000; gold $5 to $10. The mill will be kept running steadily.

CORTEZ DISTRICT.

CORTEZ BULLION.—*Silver State*, June 24: A few days ago S. Wenban shipped from his mine in Cortez district, near Beowawe, seven bars of bullion, valued at $11,107.50, the result of a four week's run of his mill.

EUREKA DISTRICT.

STARTED UP.—Eureka *Sentinel*, July 3: The Geddes & Bertrand leaching mill started up again yesterday, the spring being cleaned out so as to increase the supply of water sufficiently for present purposes. The pipes are too small and will be replaced by larger ones in a short time—when a new engine arrives to be substituted for the little engine which runs the roasting furnaces. This engine does the work required, but is too small and strains under the pressure to which it has to be subjected. When the new engine comes, this one will be taken out, to give place to it, and, at the same time, the pipes will be changed, and whatever other changes or adjustments of the machinery made that may be deemed best to facilitate operations.

JACKRABBIT DISTRICT.

PAY-DAY.—Pioche *Record*, June 24: The Pay-Day blew its whistle Thursday. Everything is now in readiness for sinking, except the shaft, which will require timbering before the cage can be run in it. We are informed that the work of retimbering will consume only a few days.

ITEMS.—Several of the miners are building stone cabins and dug-outs, the house room being insufficient to accommodate the large number of men at present residing here. About 20 tons of ore were shipped to the furnace from the Volcano mine a few days since It will assay about 65 per cent lead and rich in silver.

LEWIS DISTRICT.

BETTY O'NEAL.—Lewis *Herald*, June 28: The bottom of the shaft in the Betty O'Neal mine is now in a bed of clay, since striking which the flow of water has greatly increased, but no inconvenience has resulted therefrom, as the pumps can handle double the present amount of water with ease. The crosscuts are being pushed ahead as rapidly as possible, and about half the distance from the main level to the ledge has been run. The ore body in the winze still holds its own and is showing up a large ledge of first-class ore. No stoping is going on at present, but drifts and crosscuts are being run and the ore bodies exposed. The Betty O'Neal promises to be a big mine when more fully developed.

EAGLE MINE.—The tributers on the Eagle mine have another lot of ore out, which is not assorted, and the amount of milling ore cannot be ascertained till the second-class and waste are thrown out of the pile. The stope out of which the leasers are taking their ore is rather spotted, but from indications a large body of ore is liable to be encountered at any time. If the company continue their main adit level until under the old workings we are satisfied that a paying mine would be opened up, but until that is done but little will be known of the value of the Eagle.

A BONANZA. Work is being done on the tunnel of the Finley & Dopson claim near Middletown and the ledge exposed on the surface. The owners expect to cut the ledge in a few days and open up a bonanza.

MCGIRR MINE.—Mr. B. Record has struck it rich in the McGirr claim, and is taking out some first-class ore.

OSCEOLA DISTRICT.

NUGGETS.—Pioche *Record*, June 24: We were lately shown some valuable gold nuggets brought from Osceola, by N. St. Pierre, of Bullionville. That gentleman speaks in glowing terms of the large amount of the precious metal contained in the placer diggings there, and which only awaits the aid of capital to be brought to the surface.

REVEILLE DISTRICT.

SPECIMEN.—Belmont *Courier*, June 24: County Assessor Morgan has presented us with the finest and richest specimen of chloride ore that was ever found in the county. It was recently extracted from one of the mines in Revellle district, and will assay a way up in this thousands. Mr. Morgan says that all the mines are looking well, and considerable rich ore is being encountered.

TEMPIUTE DISTRICT.

ENGLISH COMPANY.—Pioche *Record*, June 24: An English company is preparing to take hold of the Inca mine in Tempiute district and working it. Louis Sultan, while down at Hiko, was informed that P. M. Gossett was on his way from England here for the purpose of perfecting the transfer of the property between its present owners and these who will hereafter form the company. It is also stated that a party is coming down from Idaho to take hold of and work a tunnel. Mr. Cardeza, of Philadelphia, will not do anything with his mining property at Tempiute for the present.

TUSCARORA DISTRICT.

TUSCARORA CHINESE MINERS.—*Times-Review*, June 24: Mart Smith, express agent, says that since the 1st of July last to the present time, he had shipped as the product of Chinese labor, $3,450 in gold dust. This sum, however, is but a small portion of what has been produced in the camp by Mongolian labor. In addition to the above there has been shipped in silver bullion $81,056 18, in small lots from this and surrounding districts, outside of the regular shipments of the mining companies.

ARIZONA.

GLOBE.—*Chronicle*, June 24: "Booms" are spasmodic, and, though the appearance of the camp does not at present betoken much life, we confidently expect a spasm of the mining world in the direction of Globe within the space of the next three months. Our copper is in large deposits, and the furnaces already in operation have proved it to be of extraordinary richness. Four large furnaces are already up and more are projected and in course of construction; and a half-dozen smelters running will astonish the nation with the wealth of output, and bays an electric effect upon the fortunes of Globe and its surroundings. We'll all be happy yet.

COLORADO.

THE GRANT SMELTER.—*Register-Call*, July 3: The plans for the construction of the Grant smelter were completed yesterday afternoon, and ground broken for the erection of the buildings. The building will be 238 ft long by 100 in width and be built entirely of brick and stone The lower or furnace floor will be 18 ft high, the second 12 ft. Twelve arched doors on the lower floor will receive the ore. The engine room will be 88x60. There will be 8 furnaces erected of the regular blast, similar to those used in the works at Leadville. Electric lights will furnish the illuminating power. The machinery will be manufactured by Messrs. Fraser & Chalmers, of Chicago. The estimated cost of building will be $200,000. All the latest improvements for the consumption of the gases will be especially taken care of, and no poisonous or disagreeable odors will be permitted to escape.

PITKIN'S LAST AND BEST STRIKE.—Captain Frank Shaefor, of the Pitkin *Mining News*, arrived in Denver yesterday and made arrangements to place on exhibition a monster sample of ore from the Silent Friend and Robinson & Ferry mines, the newly-discovered bonanza near Pitkin. The sample will weigh 1½ tons, and will be exhibited at the St. James hotel until the opening of the exposition, when it will take its place among the treasures to be displayed there. The incline shaft in the mine is now 42 ft deep, and the vein is 9 ft, and will yield from $75 to $500 to the ton, there being nearly 5 ft of solid galena.

A TEST RUN.—From a test run on 6,500 lbs. of Richardson ore, Russell district, made at the dry ore concentration works in that district, the ore assaying before treatment $30.87 per ton in gold, silver and copper, making a value of the crude ore of $100.32; after concentration the concentrates were found to weigh 2 635 lbs, assaying $72.78 in gold, silver and copper per ton, the whole value of the concentrates being $95.88. Taken from the assay value of the lot leaves $4.44 for loss in concentration, or a saving of 95.6 of the value. Should the ore have been sent to the smelters without concentration it would have sold for about $7.50 per ton, or $24 for the lot, while by concentration the lot will net the miner clear of smelting and concentration about $89.

IDAHO.

ANOTHER GROUP HANDLED.—Wood River *Times*, June 28: The Sullivan group, consisting of 5 claims on Deer creek, near the "Freuch Boys'" claims, has been bonded to Dr. J. W. Hayford, of Cleveland, Ohio, the price named in the bond being $25,000. The claims so bonded are the Robert Emmet, Forest Creek No. 3, Forest Creek No. 4, Buckeye and Idaho. The Robert Emmet and Forest Creek No. 3, which adjoin, show an ore vein of solid galena 3 ft in width, besides many promising indications. On the surface, average assays from the ledge show 185 ounces silver, and the usual 60, or 70, galena to the ton. The bond being a working one, about half a dozen men are at work on the claims, under the superintendency of F. M. Adams, the well-known mining man.

CUSTER.—Idaho *World*, July 3: The Custer Co. has worked out what is known as the "big Blowout." The "Blowout" was a body of ore, 300x600 ft, and varying in thickness from a few inches to 18 ft. The ore was worked in a 20-stamp mill.

MONTANA.

THE EASTERN COMMANCHE.—Butte *Miner*, June 24: This mine has lain idle since the earliest days of the camp, consisting as it does of a number of claims in lots of from 5 to 200 ft, owned by many different parties. They have all, at last, agreed to sell, and the consequence is that the Eastern Commanche has been bonded. Should the company which has bonded it go to work at once a large sum of money will be disbursed to open up the property.

THE GRANITE MOUNTAIN Work on this magnificent property was suspended last fall until arrangements for the profitable working of its ore could be made with the Algonquin Co. This, however, has not yet been done, but a short time since Supt. Perkins, of the Hope, received orders to run the 3d tunnel, a new one, in 1,000 ft Two shifts of men are working, and the vein, when struck, showed up better than ever before. Without exaggeration this mine has in sight more than enough quartz running from 30 ounces up than would supply a 100-stamp mill two years. Caplice is pushing development.

THE TROUT.—The Trout is being worked systematically and scientifically by Chris Hart, the best man in Montana for underground work. The shaft is now down 560 ft, and material is rapidly being prepared to sink 300 ft deeper. The Speckled Trout has a large amount of ore on hand.

FROM PHILIPSBURG.—"Near Philipsburg," said a large mine owner, "about 12 miles away, and on the west side of Flint creek, is a group of mines of rather singular formation. The ores are free milling, chloride ores, in walls of metamorphic slate, the vein for several hundred ft being as flat as your hand, and then shooting down. There is plenty of water close by, the mines lay in the midst of an almost inexhaustible belt of timber of all kinds, from a 2-inch pine to a 20-inch fir, and, there being plenty of wood and water, it must follow that the mines can be profitably worked. I have some of those ores, and I think they are good, averaging 50 ounces."

NEW MEXICO.

MINING NOTES FROM PYRAMID.—*New Southwest*, June 24: The Pyramid mining district, recently formed from part of Virginia district, is located south of the Southern Pacific railroad, beginning about 6 miles west of Shakespeare, at Pyramid Peak, after which the district was named..... The Viola mine, belonging to the Pyramid G. & S. M. Co., of which Col. Amos Green is President, is now being rapidly developed by its owners. The shaft is about 200 ft deep and contains 3 levels, two at 100 ft and one at 150 ft. The 100 levels are respectively 40 and 60 ft long, and are now in solid ore from 8 to 10 ft wide. This ore is copper and silver glance, and runs from 50 to 100 ounces of silver to the ton. The 3d level is 60 ft in length, and is also in solid ore, containing antidiluvian, brittle, native and wire silver. The ore in this level is very rich, and, in general features, is like that of the Silver King mine. It assays from 100 to 6,000 ounces in silver, and will average over $200 per ton. These levels are all being worked, and the main shaft is being sunk to make another level in the same ore lower down. There are from 7,000 to 8,000 tons of ore in sight in the levels, and about 1,000 tons on the dump. Hoisting works of 30-horse power are now being erected on the mine that will, when completed, be able to hoist 150 tons of ore per day. A 20-stamp mill is now being built by Rankin, Brayton & Co., of San Francisco, and will probably be completed in the next 40 days. This mill will cost $100,000, and will be, Col. Green informs us, the most comp ete ever brought into the Territory, its capacity being 60 tons per day. The Pyramid Co. also owns the Penelope mine, the extension of the Last Chance, on which 5 prospect shafts have been sunk that are all in good ore. The only work done on the Last Chance mine during the past six weeks has been to keep the water out. There are from 3,000 to 4,000 tons of ore on the dump, and about 700 tons have been shipped to the Pueblo smelting works and to Shakespeare. There is enough ore in sight in this mine to keep a 20-stamp mill going, there being about 10,000 tons in the different drifts and levels. The Last Chance ore is not so rich as that of the Viola, but it will average over 50 ounces in silver. The Ormus company, of New Orleans, of which Judge W. E. Pops is manager, is working the Henrietta mine. The mine is looking very well, and samples of the ore give very rich assays. A car load of this ore has been sacked, and will be shipped to the Stolberg works, in Germany, via New Orleans. Prof. Mosbius, who recently passed through this Territory buying ore for these works, has made arrangements by which shipments can be made to Germany for $10 per ton. The ore is shipped via the S. P. and T. & P. roads to New Orleans for $10 per ton, and from New Orleans it is carried free to ballast by vessels going to Germany. Many other mines in the district are looking equally well, although not so much developed as those mentioned. A party of capitalists from Lockport, New York, have been in Pyramid lately, making arrangements to buy property in the vicinity. Sufficient water can be found in the mines throughout the district to run mills, water being found usually at a depth of 50 ft. The town of Pyramid, formerly Leitendorf's Wells, is being rapidly built up. A new hotel, stores and dwellings are now in course of erection, or will soon be built. These houses are mostly of a temporary character and built of wood, the town having as yet but few adobe buildings.

BURRO MOUNTAINS.—*New Southwest*, June 24: One mile from Paschal in an easterly direction is situated the St. Louis mine, one of the first purchased by the Valverde smelting company, and from which nearly 700 tons of rich copper mineral has been extracted. Work has been prosecuted more vigorously on this mine than any other in Paschal. The hoisting works are in full operation, chutes are being constructed and other arrangements made to facilitate the removal of the ore. The incline at the foot of the gulch is down 150 ft, with a rich body of mineral the full width of the incline. At 70 ft levels have been run each way. The one north is 40 ft, and the one south 150 ft, with a crosscut of 40 ft to strike the footwall. Burro Mountains. At 125 ft levels have been run, and others will soon be started from the bottom of the shaft. Stoping is being continued on the 70 and 125 levels. Twenty tons are being hoisted daily and hauled to the Valverde smelter. Shaft No. 2 is down 60 ft, following the mineral from the surface. Mr. Jack Kendrick, the efficient foreman, showed us some ore in the bottom of this shaft which would run from 60 to 80 in copper. This mineral, when exposed to the atmosphere for any length of time, will slack very much, like lime. It is a dark blue ore, and the Mexicans call it petanca. They have a large body of this in the St. Louis. The Solid Silver mine, an extension of the St. Louis, and located on the west side of the gulch from where the incline was started on the St. Louis, is being opened up with push and energy. The tunnel being run on this claim is in over 250 ft, crossing several extremely rich veins of mineral. At 150 ft crosscuts have been run, showing some of the finest mineral yet extracted in this camp. A winze 7x8, all in ore, has been started at 165 ft. Ore has been hauled continually for 6 weeks from this mine to the Valverde smelter.

UTAH.

MORRISON.—Southern Utah *Times*, June 24: Contractors at work upon the Morrison claim, lying between the Comet and Cactus mines, struck the same kind of ore yesterday that is being taken out of the Comet property.

THE product of the Horn Silver mine, of Utah, for the month of May consisted of 1,500 tons of lead and 140,000 ounces of silver. The Chicago refinery, belonging to this company, shipped, during the month of May, 150,000 ounces of fine silver, and sold $63,000 worth of lead.

DURING the past few days it has been rumored that the Frisco M. & S. Co. had contracted for the building of another 50-ton furnace, but President Bigelow informs us that it is their intention only to rebuild the one now in use and put in its place a water jacket. Some splendid ore was brought in yesterday from their Cave and Carbonate properties, to which we shall refer next week.

SINKING has been recommenced in the main shaft of the Horn Silver mine below the 500 level, and also in the prospecting shaft on the north end of the ledge. The air on the 500 is reported as being quite bad, and, during the week, so overcame one of the miners that he had to be carried out by his comrades, who were also somewhat under its influence. A few days ago a couple of magnificent specimens of horn silver ore were taken out for shipment to the Denver exposition.

A New Drift Mine Channel.

From the Sierra *Tribune* we take the following: The Bald Mountain Co., of tbis place, in rnnning Lowell Avenue tunnel to open out tbe ground lying along the line between tbe Bald Mountain and Bald Mountain Extension companies' ground, crossed the same lava flow that cut tbe former company's channel in two some tbree yeare ago. Tbis channel is about

Three Hundred Feet in Width,

And ie evidently the same tbat was tapped by the Soutb Fork Co. some years since. On Wednesday of last week, a sbaft being sunk in tbe center of the flow, bedrock wae reached 55 ft. below the bottom of the tunnel. Eighteen incbee of deep blue gravel was encountered, which paid $3 50 to tbe carload. A drift ie now being rnn to the east from the bottom of the shaft. The ground continues equally ae good, averaging 60 cente per square foot on the bedrock. A drift will also be run to the west for the purpose of thoroughly prospecting the deposit. It is believed from the apparent dip of the sides of the channel that the pay deposit will be at leaet 200 ft. in width at the bottom. The indicatione are that tbis is a very valuable find, and that its importance—not only to the Bald Mountain Co., but to this entire mining section, cannot well he overeetimated.

The channel is known to extend the entire length of the company's claim, the lava flow that covere the deposit having been impigned upon at pointe far eeparate in the workinge of the mine for yeara psst. It bas, at times, heen the means of causing deep depression in the minds of the owners for fear that the old channel then and now being worked wae cut off and throwa in a different couree and away from their ground. Sapt. Wallie is very cautious about raising undue hopes, hut expreesed himself to a *Tribune* reporter in this wise: The indications now are that it ie like discovering a new mine on the claims beretofore unsuspected and of equal value with the old one that is now and has been worked for many years with great profit, and which, in its present favorable aspect (outside of the new find), bids fair in the future to rival its palmiest days. Mr. Wallie further says: In the face of Lowell avenue tnunel gravel was struck Saturday last, ehowing well in character—the value of which is yet to be determined. This, also, is a deposit unknown to the Bald Mountain folks until struck by the Extension company and traced into the former's ground. It was very rich on the line of the two claims. Tbe mine at the extreme north end is paying exceedingly well. Tne lava there met with, though carrying away a portion of the channel, bas not materially injured tbe mine, it is thought.

These lucky developments in the Bald Mountain mine finally settles the status of many undeveloped claims on thia and the adjoining ridge, and can bardly fail to open up a career of proeperty heretofore unknown. It ie now certain that tbere are two, and probably tbree, distinct pay channels coureing through them for many miles, and this now known fact explaine certain past discoveriee at widely divergent points and at unequal depthe tbat have beretofore puzzled tbe wisest mining beads.

A Deep Mine.—The deepest mine in the world, according to Prof. H. Hoefer, of tbe Academie Imperiale des Mines, is the Pribrand silver mine, in Bohemia. The lowest deptbis near'y 3,300 ft. below tbe enrface. At this depth the temperature of the rocks is only 75.90° Fabr.; and tbe temperature of the air, according to tbe same autbority, ie 76.3° Fabr.; so tbat up to the present, only natural ventilation bae been required. We are very close after that "deepest mine" here on the Comstock. The Yellow Jacket sbaft is a little over 3,000 ft. in depth, and a great deal of work has been done on tbe 3000 level. At tbe Union Con. and Sierra Nevada, and in tbe Mexican and Opbir, tbey are down to tbe 2900 level, and have done a great deal of drifting at tbat deptb. Drifting and cross-cutting are still actively progressing on the 2900 level of tbe mines named, and a joint winze of large size hae been started by tbe Ophir and Mexican companiee, wbich will at once be pushed down to tbe deptb of 3,100 ft., provided too mucb water sball not be encountered.

A Smelting Proposition.—For many years tbe reduction of tbe base ores of Meadow Lake has baffled the finest scientific ekill brought to bear on tbe propoeition. The principal difficulty has been found in tbe extreme hardness of the rock, wbich is essentially iron ore. The gold in it is course, and plainly visible, hut mining and reducing tbe ore is too expensive for profit. An iron working company of Burlington, Iowa, now propose experimenting with it, working and emelting it as they would iron ore, precipitating the gold while the iron ie in a liquid state, so that it will be found in the point of a cone of the metal wben cooled off.

Bricks from Furnace Slag.—It is reported tbat the "Schalker Gruben und Huettenverein," of Westpbalia, Germany, propoees to utilize blast-furnace slag in the manufacture of hricks. Tbe pulverized elag will be mixed with a small proportion of lime, and pressed into the ahspee required, and, after having heen dried hy exposure to tbe air, will he ready for use. The erection of suitable compreeing machinery, capable of yielding a daily output of 15,000 bricks, ie contemplated, and will thus afford a profitable and efficient means of disposing of tbe large quantities of elag produced.

The Yosemite.

Yosemite has been so often described tbat any further attempt in tbat direction may be deemed supererogation. However, there are matters concerning the great valley wbicb are now of pressing importsnce, and we cboose the present occasion to bring them forward. We introduce the aubject witb an allusion to tbe engraving, wbich gives a distant view of tbe entrance to the valley. Tbe etupendous mass of naked granite on tbe left ie El Capitan. Directly oppoeite on the right are the Cathedral Rocks, witb Bridal Veil fall throwing its silver water over them. Whetber tbe visitor enters the valley by way of the Coulterville route from the north, or by that from Mariposa on the south, the first and most prominent object wbicb meets his eye as he descende from the mountain is the towering mass of El Capitan, rieing above the floor of tbe valley about 3,300 ft., witb almoet perpendicular ascent. The sides or walle are bare, emootb and entirely deetitute of vegetation, presenting at tbe top a sbarp, clearly defined edge.

On the other side of tbe valley is tbe Bridal Veil fall, one of the most beautiful objecte in tbe Yosemite. The water is precipitated over the cliffs on the west eide of Cathedral Rocks in one leap of 630 ft., perpendicular, striking on a eloping pile of debrie, down which it rushes 300 ft. more, the total bigbt of the fall above the meadow at its base being 900 ft.

But descriptions of those objects bave been abundant, and we need not reproduce tbem here. We would present, rather, eome new facts concerning the condition and the maintenance of the valley wbich are worthy of general attention. Last year the Yosemite Commissioners requested W. Ham. Hall, State Engineer, to examine the valley and report any observations which migbt aid them in tbe discharge of their trust. Mr. Hall took up the work, and bis report bas just been issued by tbe State Printer, in pamphlet form. He disclnims tbe idea at tbe outset tbat there can be any sucb tbing as "improving" a grand work of nature like tbe Yoeemite, and holds tbat bis euggestions will pertain ratber to tbe preservation or maintenance of the grand creation in its natural form. Certain things, be says, are necessary to be done to preserve the valley from deterioration. First, the control of the mountain watersbed tributary to tbe valley streams, to prevent tbe destruotion of timber and vegetation generally thereon. Second, the regulation of the use of the floor of the valley and its immediate eurroundings, in nrder tbat tbe verdure be not altogetber trampled out of existence, or useful vegetation enpplanted by that lees desirable but more able to resist the influences of civilized occupancy. Tbird, tbe counteracting of natural deteriorative action to be found in the movement of its waters, tbe "improvement" of ite streams.

The Yosemite grant does not cover nearly all the water-shed of the valley; hut, on the contrary, while, according to tbe terms of the grant, it extends to a line drawn around tbe valley at an average distance of one mile from its edge, the real mountain hasins from wbicb drain the watere tbat constitute, to moet people, the great cbarm of the place, are altogether outside of the grant, and the rim of high land contained witbin it ie compoeed, for the most part, of rocky slopes that incline directly into the valley, or to its walle, and not to the canyons and higher valleys from wbicb issue the waters of the falls.

According to the beet information available at thia time, the entire water-sbed area of the Merced river, inclusive of tbe grant with the valley, east of a line drawn from ridge to ridge acroee the gorge, at a point on the spur just below the Cascade falls, is about 358 square miles; or, in round numbers, 229,000 acres.

Only about 30 500 acres of this territory are included in the grant as it now exists, leaving 198,500 acres wbicb drain into the valley, and wbich pertain more to tbe interior arrangements for tbe preservation of tbe valley. So far as we are able to judge, we think bis recommendatione well wortby of attention, and it ie to be hoped tbat the commission may do what is in their power to secure the preservation of the valley and to make ite charms more accessible to the throngs wbo now seek them. More than 2,500 persons visited the valley last year, and eacb year is expected to sbow a marked increase, botb from our own people and from foreign tourists.

EL CAPITAN AND CATHEDRAL ROCKS, YOSEMITE VALLEY.

Low grade Copper Ores.—Copper ores sucb as our Nevada miners would not look at are now being successfully and profitably smelted in the East. Now tbat the Americans bave turned tbeir attention to copper and silver smelting, they are making great strides in tbe business. The Orford Nickel and Copper Co., at its works at Bergin Point, N. J., ie smelting imported oree as low as tbree per cent. in copper, and for a lot recently offered, running 2⅞% in copper, $4 88 per ton wae paid. We doubt wbether in any other part of the world copper ores so low are smelted with profit—an eloquent proof of the skill of American metallurgists.—*Virginia Enterprise.*

Liability to Infection.—A man wearing dark clothee is more liable to infection from contagioue dieeasee tban he who wears light-colored garments, because particles which eminate from disensed or decayed bodies are much more rapidly absorbed hy dark than by light fabrics. This is eesy of proof. Expose a light and dark coat to the fumes of tobacco for five minutes, and it will be found tbat tbe dark one emelle stronger than the otber of tobacco smoke.

Copper Smelting.—The furnace at Bullion, Railroad district, eaye tbe Elko *Independent*, has been in full blast for eeveral days, and eeveral loads of copper ingots have already arrived from there. The run, which will continue about 20 days, is heing very euccessfully conducted, and will result in a very healthy stock of fine bullion. The amount received bere will be given at tbe end of tbe week.

Premature Blasts.

One of the Ways in Which They are Liable to Occur.

Tbe recent fatal explosion at tbe Union Con. mine hae been tbe subject of a good deal of discussion among miners and mining men. Altbough tbere has been some difference of opinion, tbe preponderance of tbe evidence adduced ebows quite conclusively tbat tbe sbocking accident which occurred on that occasion was caused by the heated condition of tbe rock in which the cbargee of powder were placed. When two or three blasts of giant and kindred powder bave been successfully fired in tbe same bole, the surrounding rock becomes almost red-hot. When a cannon ie fired very rapidly with chargee of black powder, it soon heoomes dangerously hot. It is the same in blasting, though giant powder in exploding produces a much greater degree of heat than does ordinary black powder.

The accident at tbe Union is probably as good a caee ae could be found by meane of which to illustrate tbe manner in whicb euch premature explosions occur witb giant powder. The hole had been twice fired and no water bad been put in to cool it when it wae charged for the third time. Tbe rock was so hot as to set fire to the giant powder, but it did not explode througb being on fire. A piece of cartridge mey be set on fire with a match and may burn till consumed without exploding. What caueed tbe accident was the explosion of the cap placed in tbe cartridge. Theee caps are composed of fulminate of mercury, and heat explodes them. When the cartridge hegan to hurn it heated and exploded the cap, wben, of course, the whole charge exploded.

At the time tbe explosion occurred, one of the men wae putting eome clay into the bole over the cartridge ae a tamping. But for the clay heing in the mouth of the hole be would have observed that the cartridge had taken fire, and he and all present would have got out of tbe way before the heat had reached and exploded the cap, ae hee happened on several occesions in our mines.

Thue it will be seen that it is always safeet to turn water into a hole after each discharge. When a set of men are anxious to make a big showing on their ehift, they too often will not take time to do this. They take the chances, and probably all goee well for a time, but sooner or later an accident like that at the Union occure.—*Virginia Enterprise.*

More Heroes.

The two men, William Bennett and Dennis Callahan, who lost their lives in the attempt to reach and re-cue those confined in the Alta mine, have enrolled their names upon the scroll of heroes who were not born to die. They well knew the risk, and they went boldly forward. Facing the canon's mouth, or riding into the jaws of death, amid shouts and cheers, the trumpet's blare and crash of cymbals and drums, attended with all the pomp and circumstance of glorious war, is brave but far braver is the man who faces the deadly gases and gurgling waters, and all the unknown choking fiend's of darkness, to save life, and not to take it. Let no man say that heroism has left this world, while such men live and die for men. Their bravery hallowed the world they have left, and ennobles the lives of all beholders. All men are proud to call such heroes brothers.

Ie it ever too late to add our voices to tbe general cborus in praise of a worthy act of a noble fellow creature. Altbough many bave spoken in fitting worde of such a noble act as that of the two men, Wm. Bennett and Dennis Callahan, mentioned above, it is meet that it sbould again be brought before the public mind for it to tbink of and relate to the children of tbe rising generation. Tbe rehearsal of such deeds inepiree young readere to cultivate their powers of endurance and bravery. Bravery that will cause a man to enter tbe terrible gases of a mine, to undertake tbe almost hopelese task of saving a brother, should be extolled from tbe house-top, and bis praises sung by every tongue and pen in tbe land. Tbose living in the same place should be proud to say they bad breatbed tbe eame air ae eupported such noble sonle.

C. D.

Belmont District.

A correspondent of tbe San Bernardino *Index* writes as followa abont these mines which are some 30 miles north of Dos Palmos, on tbe Southern Pacific Railroad:

A party has juet arrived in town from tbe Belmont district, Cbucolwalla mountain. Tbey have been out two montbe at work developing tbeir gold mine, whicb proves to be good. Tbey bave sunk 30 ft. and cut the lode, whicb is about five ft. wide and aseays up to tbeir expectations, running from $250 to $600 to tbe ton. It is the Walters Station mine. About one and one-half miles north of thie lode ia the Black Nut lode, wbicb contains silver and gold, is a beautiful and well defined lode about three ft. wide, and aesays $2,000 to the ton in eilver and gold, and has a number of tons of ore in eight.

The lode on the Black Nut is cleared off about 15 ft. and eunk down eight or 10 ft.

Abont 400 yarde from the Black Nut liee the Visnie mine, which is very much like the Black Nut, ie equally as rich and bae about tbe eame size lode.

The grade of ore wbicb tbese tbree lodes contain will pay bandeomely to freight to the Southern Pacific Railroad and ship to San Francieco.

A business of tbat kind will he commenced ae soon as the weather gete con', The great drawback to these mine is the scarcity of water. The water only lasts about seven months in tbe year.

A Silver Cave.

Chief of Police Bradley, who has just returned from Downieville, furnishes the Virginia *Enterprise* with some interesting particulars in regard to the recent big find in that camp. Chief Bradley is interested in an extension of the mine in which the strike was made, and went out to Downieville to look after his interests, he having two brothers residing there.

The cave was tapped by a tunnel at such a depth that it extends to a hight of some 300 ft. above the tunnel level. How far below it may go is a matter of conjecture, as below the floor of the tunnel it is filled with water.

The cave is not a vertical opening. It stands at an angle of about 40 degrees. From the floor to the roof it is from 50 to 100 ft. in hight—being quite irregular and resembling a series of chambers.

Magnificent Stalactites

Are suspended from the roof, many being 10 to 12 ft. in length, and as white and clear as alabaster. These sparkle in the light of candles like so many huge icicles. Not only are these objects of great beauty, but there are also concretions of the same beautiful material that mimic animals and other things seen on the surface of the earth. There are concretions that resemble owls, rabbits, the heads of goats, donkeys, and many other things. At the mine they have a concretion that is a perfect representation of the head and neck of a swan, bill and all being very distinct. Chief Bradley found what was an excellent representation of the head of a goat, the horns being very perfect and natural, but he had the bad luck to break off the horns in securing it.

By bringing the lights to bear upon the water at the tunnel level, the continuation of the cave can be very distinctly traced. The water is very clear, and with the lights properly placed one may peer down into it to a depth of 25 to 30 ft. Down in the water, pendant from the roof, are to be seen the same clusters of stalactites and concretions as are found in the part that has been drained.

Chief Bradley says that, standing at the tunnel level and gazing upward along the cave—when the lights have been arranged at the top and at intermediate points—the view is magnificent. The whole roof seems to be hung with chandeliers and other beautiful objects in alabaster and glass.

The ore lies on the floor and along the sides of the cave, and is so soft that it is handled with shovels. As the ore is scooped up and shoveled into the cars at the track floor, it slides down from above like so much ashes or loose gravel. It is of a deep-red color, and so stains the hands and faces of the miners that it is a difficult matter to wash it off.

While much of the ore goes up in the hundreds, it is considered safe to put the average, as it is shoveled up and wheeled out, at $75 per ton. The red dust is so heavy that a handful of it feels like so much shot. Mingled with this fine stuff are great blocks of galena, that come rolling down as the shoveling proceeds. Many of these are so large that one man cannot lift them, and it is necessary to break them up with a sledge.

No one knows the value of the find, but it is considered safe to put it at $250,000. Two carloads of the ore were shipped to San Francisco, a day or two ago, to be operated upon at works in that city. Wood is but $5 per cord at the mine, and all other facilities for working the ore.

Downieville is but a small village as yet. Chief Bradley says in looking down upon the camp after dark he counted 50 lights, and supposes there are about that number of habitations in the place. From Luning, on the Carson and Colorado Railroad, it is 55 miles in a northeast course to Downieville. The traveler goes by stage, over a very fine road.

One-half of the mine is owned by Mr. Raphael, of Wadsworth, and the other by the three brothers Downey. They have in it a big fortune. They use round timbers, cut in the surrounding hills, where it is necessary to place any kind of supports, and an abundance of these are cheaply obtainable. Mr. Bradley says it is the best region for prospecting he has yet seen. They are able to sell any paying ore they may find, no matter how small the lot may be, and therefore all the miners and prospectors in that region are quite independent. Most of them prefer working on their own account to hiring out for wages.

Mr. Bradley says this will also apply to Garfield District, and to other regions about Luning and out along the line of the railroad.

THE POCKET LEDGE.—Another very rich pocket was found in the Nichols mine on Thursday, from which about $250 in gold was taken in a few hours. During last week nearly $500 was taken from the stringer. Mr. Nichols showed a piece of the ledge to a *Union* reporter yesterday, which was fully nine-tenths gold. This valuable little mine is owned by Messrs. H. B. Nichols and E. B. Russell, who are quite sure that they have a nice little fortune in the claim.—*Grass Valley Union.*

THE GAMBETTA.—Supt. Wingard has, for the present, suspended work on the Gambetta, near the old Green Monster, across the river. He expects to go over to Deep Springs on some mining work, and will in the meanwhile let a contract for a 100-ft. tunnel on the Drummer Boy mine.—*Inyo Independent.*

Useful Information.

GILDING LEATHER.—Dampen the skin with a sponge and water, and strain it tight with tacks on a board sufficiently large. When dry, size it with clear double size; then beat the whites of eggs with a wisp to a foam, and let them stand to settle; then take the books of leaf silver, and blow out the leaves of silver on a gilder's cushion; pass over the leather carefully with the egg size, and with a tip brush lay on the silver, closing any blister that may be left with a bunch of cotton. When dry, varnish over the silvered surface with yellow lacquer until it has assumed a fine gold color. The skin being thus gilded, may be cut into suitable strips or patterns. It should be carefully observed to have the skin well dried before sizing it. Bookbinders gild the edges, etc., of leather, in a different way. They first go over the part intended to be gilded with a sponge dipped in the glair of eggs (the whites beaten up to a froth and left to settle); then, being provided with a brass roller, on the edge of which the pattern is engraved, and fixed as a wheel in a handle, they place it before the fire till heated, so that, by applying a wetted finger, it will just hiss. While the roller is heating, they rub the part where the pattern is intended to come with an oiled rag or clean tallow, and lay strips of gold-leaf on it, pressing it down with cotton; then, with a steady hand, they run the roller along the edge of the leather, and wipe the superfluous gold off with an oiled rag, and the gold adheres in those parts where the impression of the roller has been made, while the rest will rub off with the oiled rag.—*Manufacturer and Builder.*

CEMENT FOR LEATHER.—Many recipes have been given for a cement for joining leather; but the following is that which seems to have given the best satisfaction, especially for the construction of leather belting: Equal parts of common glue and American isinglass are placed in a glue pot, water being added sufficient in quantity to cover the whole. After some 10 hours' soaking, the mixture is brought to a boiling heat, and pure tannin added, until the whole becomes of a ropy consistence, or like that of the white of eggs, and apply warm. The plan is to buff off the grain of the leather where it is to be cemented, rub the joint surfaces solidly together, let it dry for a few hours, and it is ready for use. If suitably put together no rivets are required, the cement being as strong as the leather.

KRUPP'S GREAT FOUNDRIES.—Herr Krupp's possessions at Essen are enormous enough, as some fresh statistics of them will show. He has of steam boilers no fewer than 439; of steam engines, 456, their aggregate horse power being 18,500; of steam hammers, 89, varying in weight from 200 lbs. to 50 tons; of rolling mills, 21; of machines for making tools, 1,622; of furnaces, 1,556, of which 14 are high furnaces; of locomotives, 25, and of steam propellers, 5, their total tonnage being 7,800 tons. Krupp's annual production is 300,000 tons of steel and 26,000 tons of iron. At present the population of his workingmen's city is 15,700.

A NEW SOUNDING APPARATUS.—A Russian naval officer has invented an ingenious apparatus for ascertaining the depth of the sea without the use of a costly and heavy line. Indeed, no line at all is used. The instrument consists of a piece of lead, a small wheel with a contrivance for registering the number of revolutions, and a float. While the apparatus sinks the wheel revolves, and the registered revolutions indicate the depth. When the bottom is reached, the lead becomes detached, the float begins to act, and the machine shoots up to the surface, where it can easily be fished up by a net and the register read off.

ELECTRICITY FOR RAILWAY PURPOSES.—The Eastern Railway company of France has just made a new essay in the application of electricity. A train equipped with the most recent and improved electrical apparatus proceeded from Paris to Gretz. The carriages were connected by electric communications, the brakes acted by electricity, and all the compartments of the 13 carriages composing the train were lighted by electric lamps. The results of the experiments were completely satisfactory.

THE experiment o propelling street cars by electricity was tried in London a few weeks ago. Under the seats of the car Faure accumulators were placed, and they were connected with electro-motors, which rotated the wheels of the car by means of pinions. The weight of the accumulators—3,000 pounds—was a decided objection, but five-horse power was obtainable for five hours. It is asserted that cars can be moved in this way at half the cost of horses.

IVY ON WALLS.—It is a popular error to suppose that ivy growing on the walls of a house makes it damp. The attachment of ivy to walls, so far from injuring them and causing dampness, is an advantage. If the walls are dry when planted, ivy will keep them so. If damp, as the plant overspreads their surface, the dampness will disappear.

WELL-SEASONED POSTS, when thoroughly dried and then charred and dipped in hot tar, will remain rot and insect proof for many years in almost any kind of soil.

IMITATION WOOD CARVINGS.—Ever since Blanchard invented the eccentric lathe, American mechanical ingenuity has been taxed to produce a wood carving machine that should be a sufficient substitute for hand labor, and although several carving lathes have been invented, for various reasons none of them have been an unqualified success, nor have proved of commercial value. More headway in substituting machine work for hand work has been made in other directions, and pressed wood ornaments, produced by dies and now largely used, supply an acceptable substitute for carvings on furniture of the cheaper grades.

ACID RESISTING CEMENT.—To make a cement for glass that will resist acids: Take 10½ lbs. of pulverized stone and glass, and mix with it 4½ lbs. of sulphur. Subject the mixture to such a moderate degree of heat that the sulphur melts. Stir until the whole becomes homogeneous, and then run it into molds. When required for use it is to be heated to 248°, at which temperature it melts, and may be employed in the usual manner. It resists the action of acids, never changes in the air, and is not affected in in boiling water. At 230° it is said to be as hard as stone.

INSURANCE AGAINST MACHINERY ACCIDENTS.—There is a company in Manchester, England, that insures engines against accidental breakdowns. The object of the company is to reduce breakdowns to a minimum; and their periodical investigations by indicator diagrams often lead to the discovery of unsuspected defects. A report recently made shows that of the breakdowns of the insured engines, 49% were due to accidental causes, 14% to the negligence of attendants, 20% to old flaws and defects, and 14% to weakness or faulty construction.

THE gimlet-pointed screw was patented in 1846. It is familiar to everybody, and millions have been realized from its manufacture; yet so simple is the principle that the wonder is that it was not thought out and applied almost as far back as the age of iron.

TO TIN SMALL CASTINGS, clean and boil them with scraps of block tin in a strong solution of cream of tartar.

Good Health.

The Advantages of Two Eyes.

In response to the question, "What is the use of having two eyes?" the answer has been given, "To have one left if the other is hurt. Much as we may admire the sagacious foresight of this youthful physiologist, it will not be found sufficient to rest contented with his ultimatum. He had evidently not tried his skill to find how unexpectedly he would miss the inkstand while endeavoring to dip his pen into it at arm's length with one eye closed. He had not thought of holding his finger a few inches in front of his face to find what part of the wall it would hide from each eye in succession, or how differently it would look when regarded from those two points of view separately, how much thicker it would appear when both eyes were open, how readily he could examine three sides of it at once, how much more definitely he could judge its distance, in a word how much more comprehensive was the information given by two eyes if used at the same moment. Assuming that he knows exactly how to account for the inversion of the retinal image and the erect appearance of the object there pictured, how our visual perceptions are only signs of what we momentarily feel on the retina, signs that generally represent the realities with a fair degree of accuracy, but may sometimes represent almost anything else on demand, how, if the eyes be healthy, we have no consciousness of possessing any retina at all, but instantly and unconsciously refer every retinal sensation to some external body whose existence we are obliged to assume, unless there be special arguments to convince us to the contrary—granting all this, our young physiologist has not thought of inquiring how it is that, although two retinal images are produced, we see but a single object, and this despite the fact that, like photographs of the same body simultaneously taken from different standpoints, these two images are necessarily dissimilar.—*Popular Science Monthly*

CURES FOR BALDNESS.—The *Chemists' Journal* says: Dr. Xavier Landerer, of Athens, has again been so obliging as to send us some notes from the cradle of pharmacy. Numberless remedies for baldness of French, English, German and American origin stock our markets, but none, according to Dr. Landerer, equal in efficiency the following, which he has used and prescribed for many years past: Prepare a tincture of the cups of the *Quercus ægilops*, which are known in commerce as valonia, and digest with it powdered cloves and cinnamon. Make a tincture by digesting the leaves of the *Laurus apollonis* in acid wine, and mix the two together. Before applying this remedy the skin of the head should be well washed with a decoction of saponaria root (*Saponaria levantica*), to cure any *exanthema pithyriatias* which may be present. Instead of pomatum or hair oil, laurel oil should be used, this being the usual hair oil in vogue among the ladies of the East. Dr. Landerer calls this remedy for baldness *alexitrichon*, or hair preserver.

PAINLESS DEATH.—Mr. Giffard, an eminent French aeronaut, who secured enthanasia by an invention of his own for inhaling chloroform, has bequeathed to the Government a sum to be devoted to institutions in which persons suffering from painful and incurable maladies may be allowed, with the consent of the friends, to shorten life by pain killers under the direction of medical experts. Other parties laboring in the same direction, are agitating the matter of executing criminals in a painless manner. A correspondent of the Sacramento *Union*, Mr. John Ethel, communicates a long article to that paper, suggesting a powerful electric battery or the use of carbonic acid as a substitute for hanging. Either would be quite painless and very simple in use. With the former, death is instantaneous. In using the latter the subject should be placed under a receiver, which might be made quite artistic and inviting. As soon as the acid rose to the mouth and nose there would be a slight struggle and all would be over. In either method there would be cleanliness and decency, and no failures could occur. One writer concludes with the following paragraph: "All this would be far more humane than to hang by hanging hands. The law certainly does not mean to torture the murderer. It only wishes to end his life, and the more swiftly it is carried out the more effective and painless it will be to the victim. The age we live in demands a change soon, for even in the punishment by death there may be progress. Civilization demands a change, because science offers far more humane methods, but at the same time makes the methods far more feared by the criminal than the old style of hanging by the neck.

RECKLESS USE OF HYPODERMIC INJECTIONS.—A recent painful case of death caused by a hypodermic injection of morphia directs attention afresh to the dangers of resorting to this most perilous mode of administering drugs designed to relieve pain. The public should be warned against the practice of employing remedies hypodermically. So formidable a "remedy" should on no account be used except under medical advice, and when deemed necessary it ought to be given by practitioners. We have repeatedly urged the profession to discountenance the recourse to injections under the skin, which is becoming general. It is a practice of extreme hazard, and we are of opinion that surgical instrument makers should refuse to sell the requisite apparatus to lay persons, and that medical men should forbid their use.—*London Lancet.*

CORNS CURED.—The safest, the most accessible and the most efficient cure of a corn on the toe, is to double a piece of thick soft buckskin, cut a hole in it large enough to receive the corn, and bind it around the toe. If, in addition to this, the foot is soaked in warm water for five or more minutes every morning and night, and a few drops of sweet or other oily substance are patiently rubbed in on the end after the soaking, the corn will almost infallibly become loose enough in a few days to be easily picked out with the finger nail; this saves the necessity of paring the corn, which operation has sometimes been followed with painful and dangerous symptoms. If the corn becomes inconvenient again, repeat the process at once.—*Good Health.*

POISONOUS BULLETS.—A German journal refers to a discovery made by M. Gros, of Paris, which tends to throw some light on the complaints which were made, but not seriously inquired into, during the Franco-German war, as to the use of poisoned bullets by the combatants on both sides. M. Gros explains that the construction of the modern breech-loading arms causes the bullet to convey with it a portion of the hydrocyanic acid, which the explosion of powder has caused to be accumulated in the barrel. Even if poisoning to a mortal extent does not take place, it is remarked that the healing of wounds is materially retarded by the circumstance.

SOFT BEDS.—Why should soft beds be considered unwholesome? Certainly they afford more comfort than hard ones. Hard beds should never be given to little children, and parents who suppose that such beds contribute to health by hardening and developing the constitutions are surely in error. Eminent physicians, both here and in England, concur in this opinion, and state that hard beds have often proved injurious to the shape of infants. Birds and animals cover their offspring with the softest material they can obtain, and also make soft beds for them. Why not do the same with our own young?

A FEVER MIXTURE.—Dr. Fothergill, in speaking of the following formula, says it will probably constitute par excellence the fever mixture of the future. It is especially indicated where there is cerebral disturbances: Acid. hydro-brom., one dr.; syr. simplicis, two dr.; aq. ad. one ounce. M. Sig. Every hour.

FORCING THE INTELLECT OF CHILDREN.—The *Medical and Surgical Reporter*, in a recent able editorial on this subject, contends that much injury is done by sending children to school too early, and holds, very properly, we think, that the portion of life prior to puberty should be devoted mainly to physical development.

HOT WATER FOR INFANTS.—Recent cases are noted in the medical journals of tetanus, or lock-jaw, having occurred in infants on account of being bathed in too hot water. A single nurse reports several cases of the kind.

TABLE OF CONTENTS.

EDITORIALS—New Desulphurizing and Oxidizing Ore Furnace; Lead Poisoning, 17. Passing Events; Dredging for Gold; Debris Dams; Hoisting Engines; Perpetual Motion and Patents, 24. Hydraulic Machinery; Lowell Hill Mines; Long and Deep Underground Workings; Mechanical Mine Ventilation, 25. Patents and Inventions; Notices of Recent Patents, 28.

ILLUSTRATIONS.—Perspective View and Section of Desulphurizing and Oxidizing Furnace, 17. Mine Ventilating Fans, 25

CORRESPONDENCE.—Lumbering in the Mountains, 18.

MECHANICAL PROGRESS.—Thinking and Working; Sparks from Cast iron Gears; A Novel Steam Engine; Screw Drivers; Pressures in Boilers at Sea; Acid in Machine Oils, 19.

SCIENTIFIC PROGRESS.—"Water Hammer" Action in Earthquakes; Diastase in the White of Eggs; Ammonia from the Nitrogen of the Air; The Sun's Heat; Absorption of Metallic Oxides by Plants; Electric Current Produced by the Action of Light; Chemical Analysis of Tissues; A New Theory of the Formation of Coal; Color Printing, 19.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends, 20.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Montana, Colorado, Idaho, New Mexico and Utah, 20-21.

USEFUL INFORMATION.—Gilding Leather; Cement for Leather; Krupp's Great Foundries; A New Sounding Apparatus; Electricity for Railroad Purposes; Imitation Wood Carvings; Acid Resisting Cement; Insurance Against Machinery Accidents, 23.

GOOD HEALTH.—The Advantages of Two Eyes; Cures for Baldness; Painless Death; Reckless Use of Hypodermic Injections; Corns Cured; Poisonous Bullets; Soft Bons, 23.

MISCELLANEOUS.—Safford District; A Hint to Prospectors; Prosperity in Arizona; American Fork Canyon, 18. A New Drift Mine Channel; The Yosemite; Premature Blasts; More Heroes; Belmont District, 22. A Silver Cave, 23.

Business Announcements.

Dividend Notice, Standard Consolidated Mining Company. Millwright's Hand Book, R. P. Ashley Camden, N. J.

Passing Events.

There is very little to note in connection with the mining interests, aside from what is said in our "Mining Summary." Work is going on in every direction in all the mining camps. Among the gravel miners the recent excitement is somewhat allayed, and many of them are engaged in complying with the terms of the judicial decision, which compels them to impound the heavier debris.

No movement is being made here for California being represented in the mining exposition at Denver. No Commissioner has been appointed from this State, as yet.

The week has been given to recreation and amusement. The three holidays decreed by the trade functionaries of the city were all taken by the mass of citizens, and the diversion has been greater and more general than usual. The public demonstrations in honor of the day were about as successful as usual, and, so far as heard from, were fortunately attended by no great mishap or conflagration. People who have anything to burn generally breathe freer on the morning of July 5th, for the suspense is removed either by destruction or safety.

AS YET we have seen no indications of any movement in the State, says the *Enterprise*, to accept the invitation of the people of Colorado to join with them in making the National Mining Exposition a success. Apathy in this matter is not creditable to our State. The exhibition is to open about four weeks hence. Whatever is to be done should be done quickly.

Dredging for Gold.

There is probably no mining proposition which can be rendered more attractive by argument than that of dredging river bottoms for gold. There is none which, in practice, is more difficult to accomplish.

In California we have had considerable experience in gold mining, more from the nature of things than most communities. Gold is found here in all the conditions it is found anywhere, and we have tried all sorts of means to obtain it from all sorts of deposits. Our experience has been limited to no small field, and whatever has come to the front to be tried as a gold-saving or catching appliance we have tried. When some man comes along, therefore, with a new proposition for gold mining, it behooves people to find out first whether the California people ever tried it, and what the result has been.

Mining boats, vacuum pumps, dredgers, etc., for obtaining gold from the bottoms of rivers, have been tried here in various places, and in no case have they ever been successful in getting gold enough to pay expenses. They have been tried in the ocean up at the beach mines of Gold Bluff, and in several of our rivers at different places. Many plans have been experimented with, and thousands and thousands of dollars have been spent in the vain endeavor to get the gold by this means.

This system of mining, however, is very attractive to those who know nothing about mining. Scooping up golden sands by the hundreds of tons and getting the pure metal by the hucketful is a proposition almost any one will listen to. Therefore, notwithstanding our experience here, several times every year we hear of mining boats being built by enthusiastic miners, (?) who are going to get rich quicker than other men.

We have several times made the statement that these systems of mining have failed, but we have noticed that remonstrances have small effects on the enthusiasts, who allow their excitement to get the best of their judgment. It is usually announced that these boats have been in use on California rivers, which is true; but it is not announced that they have failed.

The latest instance of this failure of this system occurred at Snake river. A correspondent of the Chicago *Mining Review* tells of it as follows, and the recital reminds us strongly of similar previous failures:

"Last week I was down at Snake river, 100 miles distant, to witness the operations of the two dredgers, built under the Sanders' patents, for sucking up the golden sands of Snake river and saving the gold. Two Detroit companies own the dredges, and the Presidents of both concerns were there to witness the operations. The dredge, near the Goose Creek ferry, consists of a vacuum drum for sucking the sand from the river bottom; innumerable shakers and washers, all worked by steam power, were set in motion on two consecutive occasions, demonstrating one of two facts, that the dredge was a failure, saving no gold or that there was little gold to save, the latter approximating nearer to the truth than otherwise. The originators of the scheme claimed that the black sands of the river carried from $500 to $2,000 to the ton, coated over with iron, and which could be saved either by fire or bumid assay, while the naked facts are that the sands averags about 20 cents of gold to the ton, no gold being coated over or existing in the sand other than that existing free in the sands. The enterprise is regarded by the Presidents of the concern very unfavorably, and their denunciation of the patenteee were both ludicrous and amusing. A great many persons working with sluices and rockers, up and down the river, are making wages, and considerable gold is annually mined by the most primitive methods, which seem to be the most practical ones."

Debris Dams.

As we have before stated, several of the mining companies have commenced work on dams for controlling the heavier debris, so as to prevent it from passing into the rivers, and to comply with the decision of Judge Temple. The valley people do not seem to be very much pleased with this result, having hoped, no doubt, that hydraulic mining would be stopped entirely. Active measures, however, on the part of the miners, are now being taken to continue their work under surer auspices than before. The latest development in the matter is the issuance of the following manifesto signed by C. A. Bingham, Mayor of Marysville, and C. E. Saxey, President of the Sacramento Valley Anti-Debris Association:

To the persons and corporations engaged in hydraulic mining upon the Yuba and Bear rivers: As the duly authorized representatives of the citizens of Marysville and of the Sacramento Valley Anti-Debris Association, we respectfully call your attention to the fact that your assumed right to use the beds of said rivers as a place for the deposit of your mining debris has been denied after a long and patient trial before a judge of your own choice, in the test case against the Gold Run Mining Co. In view of this, it becomes our clear right and duty to demand, and we hereby demand, of you that within 15 days from this date you cease to deposit your mining debris in said rivers or their tributary streams, and we hereby notify you that a refusal to comply with this reasonable and lawful demand will oblige the parties injured by you to report to the Courts for appropriate redress.

Hoisting Engines.

The question of type of hoisting machinery for mines is a very important one, since upon its decision depends, to more or less extent, the question of profit or loss of the mine. Of course, when a mine is being prospected, ordinary portable hoists do very well, and there are several good types of this class made in this city, which answer the purpose admirably. For permanent mines, with comparatively shallow workings, there are strong, heavy hoists sold and made in San Francisco which have many advantages, because we have had here great experience in this line, and the manufacturers and dealers know the wants of the mining community. For very deep mines, where large amounts of ore and wash are hoisted, and the cages and cables are very heavy, elaborate hoisting works are made here of patterns possessing every possible nicety of detail to adapt them to the purposes intended. Our foundries make hoisting outfits for deep mines which are the admiration of all the mechanics who see them.

Of course the type of engine to be used depends on the work to be performed. The very large hoisting outfits for deep Comstock mines are elaborate pieces of machinery, and great care is paid in every detail. The engines combine all the latest improvements of every kind. We have described several of these engines, and most of our readers are familiar with the type. Being the most important mechanical appliance at the mine, it is at the same time the most expensive in construction and working.

In the course of a paper on the subject of systems of colliery working, read some months since by Mr. C. M. Percy, of Wegan, before the Manchester Geological Society, that gentleman gave some interesting points concerning the practices in Great Britain. He stated that there seems to be two principal directions in which efforts might be made for effecting economy in winding engines. The first, he argued, was by the application of condensers. He then went on to say that we, in Lancashire, have for many years practically turned our backs upon condensing winding engines, and have gone in nearly universally for high-pressure, non-condensing engines, and although in this county we possess the very best examples of this kind of engine, they are very expensive to work.

In the north of England, in many cases, the spirit of James Watt possesses the minds of engineers, and within the last few weeks the writer was fortunate in seeing at work a winding engine with condensing arrangements and doing good work. To raise 1,800 tons of coals from a depth of 600 yards, and to lower and raise 1,000 men and boys, all within 20 hours, is good work for any engine at any colliery; but to do this with steam never above 20 lbs. pressure from four externally-fired boilers, each seven feet in diameter, is a result not surpassed at any colliery with which the writer is acquainted. The actual useful horse power performed is nearly 100 tons per hour, raised 600 yards, equal 200 horse power. Four boilers, each 40 ft. long and 7 feet in diameter, may be taken as equal to generating steam equal to 800-horse power, if worked at a moderately high pressure of 60 or 70 lbs. And to obtain with a working pressure never exceeding 20 lbs. useful work, representing a continuous power of 200, is very satisfactory. The class of engine, viz.: a single vertical, is not equal, in the writer's opinion, to the usual Lancashire engines, horizontal and working in pairs. But why not take the better parts of each class and have the usual Lancasbire winding engine, with a condensing arrangement attached? A condensing engine always insures an effective pressure from the same steam of 15 lbs. in excess of anything attainable from a non-condensing engine.

The ordinary winding engine in the Lancashire district, taking steam from the boilers at 45 lbs. above the atmosphere, equal to 60 lbs. absolute, will do exceedingly well if it receives an effective pressure upon the piston of 30 lbs., being one-half used and one-half lost. A condensing winding engine, taking steam from the boilers at 20 lbs. above the atmosphere, equal to 35 lbs. absolute, will obtain an effective pressure upon the piston, inclusive of vacuum, of 27½ lbs. So that with non-condensing engines the effective fraction would be about half, and with condensing engines three-quarters. At Bestwood collieries, near Nottingham, there is a pair of vertical-winding engines, 36 inch cylinders, which can be used either condensing or non-condensing. The steam pressure at the boilers is 60 lbs., and the average vacuum obtained is 12½ lbs. The air pump of this condensing arrangement is worked by a separate engine, and the opening or closing of a couple of valves sends the exhaust into the condenser or into the atmosphere, and puts the winding engines to work condensing or non-condensing, as may be required.

THE COPPER SMELTER.—Progress is being made in erecting the smelter for the Blue Light mine, at Soda Springs. The site is being graded and the buildings under course of construction that are needed at and around the place. Work is being prosecuted on the mine in the way of putting up hoisting works and making other preparations for the extraction and hoisting of ore. Considerable material has already arrived on the ground for the smelter, and before many weeks it will be ready to start up.—*True Fissure.*

Perpetual Motion and Patents.

Every now and then we see the item drifting around in the papers that some one is at work experimenting with "perpetual motion," to get the Government reward for the invention. The U. S. Government does not offer rewards for inventions or discoveries other than it confers by granting patents for the exclusive right to use the invention for a specified term of years. If an inventor gets up something which is of use to the Government, the Government pays for the use of it, the same as a private individual does, but it does not offer rewards.

A man who gets up an invention and makes an application for a patent for it is granted the patent, provided no previous inventor has patented the same thing. Then, when the patent is issued, the invention has the sole right to make, sell or use his invention, whatever it may be.

And this right guaranteed to him by the Government is a sufficient reward. If the invention is no good at all or of little utility, nothing is made out of it, as a general thing. But more depends on the means employed to introduce it than on the invention itself. A poor invention may be a financial success, while a good one may never make any money for its inventor or owner. It all depends on the introducer and the manner of introduction.

If an inventor sits down and waits for capital to hunt him up, he generally sits a long time. If he stirs around and brings his device into public notice by advertising it, describing it and talking it up, then its merits will be seen, and his reward is forthcoming.

With all this the Government has nothing whatever to do, outside of the general protection it gives by its patent. It depends on the individual entirely, and the Government gives him no help by reward or pecuniary assistance.

As to a reward for perpetual motion, that is absurd. In the first place, perpetual motion is absurd; and in the second place, the patent office authorities generally examine these things very closely, and refuse to grant patents on devices manifestly impracticable.

Again, very few inventors of perpetual motion apply for patents. They generally prefer to ask for a caveat, which gives them protection for a short time and keeps the invention secret while the experiments are being made. The most enthusiastic perpetual motion man usually gets over his excitement during the experimental stage.

Therefore when it comes time to perfect his invention and apply for his patent, he has found out that the thing is impracticable. In the patent he must give, in detail, all his mechanical construction and operation, and it must stand the test of mechanical correctness. The examiners at the patent office understand their business well enough not to pass through their hands a thing manifestly absurd in mechanical detail. A caveat can be, and is, drawn in general terms, leaving a great deal of latitude to the inventor to alter, amend, change or reconstruct.

But with the patent it is different, and all detail must be explained. If this is not done, the patent office will reject the application.

Of course, nothing we could say would deter men from experimenting in this direction. Every week some old device crops up in the hands of a new man. And each succeeding individual imagines he has solved the problem. But it may save some one trouble to be told that if he is working for the Government reward, it will not be forthcoming when he gets through.

ORE AT LUNING.—Ore is still being brought to Luning from the surrounding districts and readily disposed of to J. C. White, the agent of the Castle Dome smelting works, at Melrose, Alameda county, California. Cash is paid for lots of ore in any quantity, and the prospector is thereby enabled to open his mine and determine its value and extent. Quite a number of men are in the surrounding districts, and all of them report favorable indications, while several are really making a little money.

THE shipment of metals for the week ending July 1st, include 49 cars bullion, amounting to 1,119,622 lbs.; two cars copper matte, aggregating 40,380 lbs., were sent East; six care lead, amounting to 151,087 lbs., and seven cars of ore, aggregating 169,600 lbs., were sent West, making a grand total of 64 cars, aggregating 1,480,689 lbs.—*Salt Lake Tribune.*

NEARLY all the mines now being worked are sending fine specimens to the Denver Exposition Commissioner at Salt Lake. Samples of ore are also wanted from all claims formerly productive, but now idle for want of capital. Utah is an immense mining field, able to show as well the fine products of the past as the rich harvest of precious metals of the present.—*Salt Lake Tribune.*

BISBEE sends three specimen pieces of ore to the Denver Exposition, one of which will weigh three tons, one two and one of one ton. They will be exhibited as a part of the Atchison & Topeka railroad collection, and on the closing of the Exposition at Denver they will be sent to Washington.

ANOTHER fine flowing well is reported from Tulare county, water being struck at a depth of 326 feet.

Hydraulic Machinery.

Pumping and Hoisting Appliancee for Mining

Thn application of hydraulic power to dnep mines in America is very limited, thongh in England and on thn continent nf Europe there is a nnmber of placss whare it has been applied with good effect. But tho application upon ths Comstock mine at the Chollar, Norcrosa and Savage combination shaft is hy far the hnaviest machinery of the kind aver aet to work. There they are lifting the largest quantity of water, and using a greater pressure and working under a greater head than bas ever before heen attempted. Tbe general features of the machinery, which was built by the Risdon Iron Works of this city, are as follows:

The surfacn engine nsed to pump the water (to be used as power) into an accumulator or air vessel. Tbe engine nsed for this purposo is a direct-acting engino nperated and controlled by the Davey differential valve motion, and has sufficient espacity to pnmp 1,600 gallons per minute to a hight nf 1,600 ft., or twn sets of pumps, 1,600 gallons, 800 ft. Henoh. The diameter of the high-pressure cylinder is 35 inches; low-pressure, 70 inches diameter—10 ft. stroke, both cylinders connecting on nne cross-head, from which four plnngers, each 8½ inches diameter by 10 ft. stroke, aro driveu. Tne air pump is also driven from this cross-head, and lies between two nf the above pumps.

Attached to the engine are automatic valves, which control the engine; tbat is, will stop the engine sbould the pres ure inside the accumulator rise or fall below a certain limit.

This engine draws her water from a cistern placed above the pumps, into wbich cistern the water is rcturned from the pumps at the hottom of the mine after it has done its work, tbus working the water nver and over continuously.

Tho water being forced hy this surface engine to a pressure of about 900 lbs. per square inch in the accumulator (an upright vessel about 20 in. diameter and 80 ft. high), is carried down the shaft to a distance of 2,400 ft., and there acts upon the pressure rams of the pump proper, and forces the mine water from the 2,400-ft. level np to the 1,600-ft. level, or to a height of 800 ft. perpendicular. There is thus a pressure of say 900 lbs. per square inch due the surface engine plus the pressnre of 1,032 lbs. per squsre inch due to the water column, or equal to 1,932 lbs. per square inch total pressure.

This prestsure acts upon four pressnre rams, two at each end of the nndergronnd pump, which in turn act upon the main pumping rams that take the water from the mine and force it to the 1,600 ft. level. The pump plunger is 14 in. diameter, 10 ft. stroke; the other pressnre rams, diameter 6½ in., same stroke, and deliver 78 gallons each single stroke, or for two pumps equal to 156 each single stroke. The valvea for operating these rams are exceedingly simple and are all operated by water pressure, the motious being given and worked hy means of small ¾ inch valves, through a ¾ inch gas pipe, so that the movement is perfectly eilent and with out shock or jar, and works as if there was only 10 lbs. pressure in the pipea instead of 2,000 lbs.

To add to the difficnltics of thia particnlar pump the mine water had a temperature of 165°, hot enough to acald any one nnfortunate enough to get any of it on him, and requiring special valvee to withstand the beat and pressure.

The pipes conveying the water from the surface were made of cast iron, a special mixture being used to insure strength. Arrangements had also to be made for the expansion and contraction caused by the heat and cold, and also to equalize the immense weight to he supported.

These pumps have been running for over a year and giving perfect satisfaction, requiring less attention, less expenao for fuel, and less wear and tear than the ordinary Cornish system, and lesa than was expected when put up. In the same shaft there is a first-class Coroiah system of pumping, with a very superior direct-acting engine on the surface, so that a direct comparison can be made, and is made, hy running hotb systems alteruately from the aame boilers, and comparing the work done and attendance required, aod such compariaons are greatly in favor of tbe hydraulic plan.

With tbe two pumps, 1,900 gallona per minute have heen lifted, or equal to 2,736,000 gallona per 24 hours, or 11,400 tons of water raiaed 800 ft. per day.

At the preseot time, instead of using the surface engine to get up the preaaure of water, they use water from the mains of the Virginia & Gold Hill Water Co., and obtain the necessary head hy discharging the water at the 1600 level, instead of returning it to the surface.

This, of course, acts perfectly, as they obtain the same effective preasure on the power rams; but it is at the expense of tbe water, which runs to waste instead of being used over again, as in the engine.

In addition to pumping, the power from the accumulator can be applied to hoisting or to blowers or compressors, and haa the advantage, that it can be cooveyed to any diatance and applied, as in the water worka supplying a city, and with a surprising small loss of power. It may also be utilized, as in the case of a water power near a mine, say within two or three miles, in which case it is only necessary to put up a proper wheel with wbich to drive compressing pumps, from which the power can be taken in any and as many directions as required. This is in actual nse and very satisfactory.

Also in localities where tho mines are witbin a reasonablo small radius, say three miles, a central power depot would supply the power for the whnle, with the advantage that should one particnlar mine strike a body of water, requiring dnuble or treble the powar usually employed, such additional amouot could be sent along by simply turning on more water from the main pipe, thereby preventing the stoppage of the wnrks for an indefinite period or erecting separate expensive works on each separato mine.

Lowell Hill Mines.

EDITORS PRESS:—The leading industry on tbis divide, betweeu Bear river and Steep Hollow creek, in Nevada county, is mining, both hydraulic and tunnel. The Little York, Christmas Hill and Liberty Hill claims are hydraulic. The Steep Hollow (or Dewey), Plaoet, Wildcat, East New York, Swamp Angel and Golden Bull (or Morgan) are tunnel claims. Some of the tnnnels are of great length, and cost from $30,000 to $50,000 to dig and timber each one of them. The East New York has a tunnel 2 600 ft. in length; the Wildcat, 2,500 ft.; and the Planet, 2,600 ft. Railroad iron tracks are laid in the tunnels, and the pay gravel is run from the breast to the dump on a down grade in cars that carry a ton each. The gravel is washed in long sluices outside of the tunnels.

Mining has been reduced to a perfect science; aod as the gravel in this divide pays very evenly, each foreman and superintendent can very closely estimate each week's profits by the nnmber of car-loads rolled out to the dump. The mines are run day and night. The tunnel claims are all newly opaned, excepting the Swamp Angel. It ia eight miles from Lowell Hill down to Little York, and the divide will average a mile in width. The channel of gold-bearing gravel is supposed to rnn down the middle of the divide. Near each claim there is a small settlement which comprisea a miners' boarding-house and the residences of tbe officers and employees of the mining compaoy. Many of the miners bave their families with them, living in neat and tidy cottages. The miners and their families must have butter, milk, fruit, and vegetables; and, aa the ranchers of the higher hills can produce a better quality of each variety than the farmers of the valleys can possibly undertake to do, there is a perfect harmony of interest between the miners aod ranchers of the mountains. THOS. S. MEYRICK.

Lowell Hill, Nevada Co.

THE closing up of the Boston Mining and Stock Exchange is now under consideration. The business has for some time past heen very dull, and there are no prospects of its betterment. The expenaes are heavy, and the only apparent remedy is to close. A meeting of the members is to be called at an early date, and the matter will then be fully considered and some action taken,

Long and Deep Underground Workings.

We have in this country only a few very deep mines, and only a few also that have any very extensive nnderground workings. Here we have been mining only a short time as compared with what European countries have been doing. Of late years, however, with the heavy improved modern machinery, very rapid work is done, the power drills and high explosives doing the work of scores of men. Deep mines are therefore not uncommon, but most of our workings are shallow when compared with the mines of Great Britain.

The deepest pit in Scotland is by shaft, 1,050 ft., and by working, 1,470. It is the Nitshill-Hurlet, in Renfrew; of this pit the longest air current is two miles, 1,246 yards. In South Staffordshire and Worcestershire the deepest pit shaft is 1,950 ft., and is owned by the Hamstead colliery company, near Birmingham, the present length of air current is 1,048 yards. In South Durham, Westmoreland, Cleveland, Whithy, and the Dales, the deepest pit is the No. 2 of the Seaham colliery, the shaft of which is 1,688 ft., and the workings 2,005 ft. in depth. In Monmouth, Gloucester, Somerset, and parts of Glamorgaoshire, and Breconshire, the deepest pit shaft is that nf the Easton, at Bristol, the depth by working being only 1,080 ft., the longost air current being three miles, 940 yards. In the district of North and East Lancashire and Ireland the deepest pit shaft is that of Ashton Moss, Audenshaw, Manchester, the working depth being the same.

The longest airway is that of the Bradford colliery, Manchester, which extends above eight miles. In the Derby, Nottingham, Warwick and Leicaster district the deepest pit is that of the Steetley colliery, Nottinghampshire, which is 1,758 ft. by shaft and 1,770 by working, the longeat air current being 3 milea and 20 yards. In the West Lancashire, the Wigan and St. Helens and North Wales district, the deepeat pit is that of the Rosebridge colliery, Wigan, which is 2,418 ft., the longest air current being 2 miles 622 yards. In the eastern division of Scotland the Blantyre pit has a depth of 930 ft., the longost air current being 1 mile and 1,136 yards. In the South Wales district the deepeat shaft ia that of Harris Navigation, Pontypridd, which is 2 277 ft., the depth by working being only 2,079, and the largest air current 1,450 yards. In the Yorkshire and Lincolnshire district the deepest shaft is 1.533 ft., and is that of the Haigh Moor Seam, New Sharlston colliery, near Normanton, the longest air current being two miles. In the district of Northumberland, Cumhorlaod, and Durham (north of the Wear) the Hutton seam of the Wearmouth colliery has the greateet depth, the shaft being 1,722 ft., and the longest air current 5 miles and 528 yards. In the North Staffordshire, Shropshire and Cheshire district the deepest shaft is that of the Astley, in Cheshire, which has 2,060 ft. in vertical depth, reduced to 1,200 ft. by incline in the workings, the longest air current heing 2 miles and 480 yards. Of the metalliferous mines, the greatest depth of shaft is that of the Dolcouth, in Cornwall, being 2,160 ft,

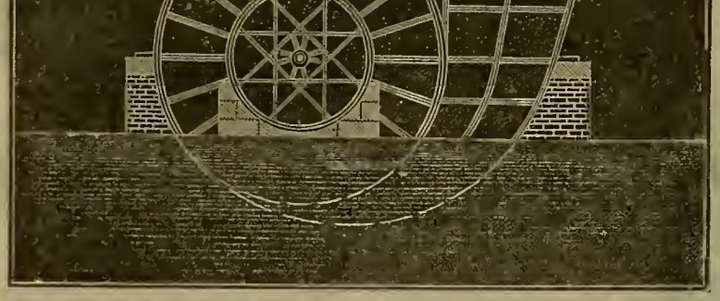

FIG. 1.—FAN WITH IRON CASING, CHIMNEY AND DRIFT.—Elevation from Drift Side

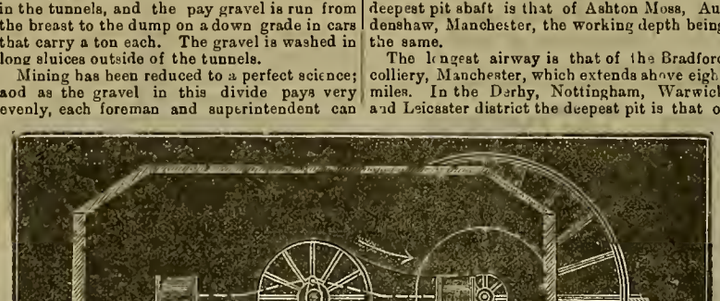

FIG. 2.—FAN DRIVEN WITH ROPE GEARING.—Elevation from Engine Side.

Mechanical Mine Ventilation.

Mr. C. M. Percy, nf Wigan, is contributing to the London *Colliery Guardian* a series of valnable articles on the "Mechanical Engineering of Collieries." That portion referring to the snbject of mechanical ventilation of mines is specially interesting. We take from the source referred to the following concerning the big fans; and it may be stated, parenthetically, tbat large Guibal fans are in use on the Comstock in Nevada:

Fig. 1, accompanying this article, represents a ventilating machine with iron casing and circular iron drift, shown from the drift side. Fig. 2 gives the same arrangement from the engine-house side, and shows two horizontal engines, either one of which connect with the ventilator. To enable a slow-working engine to produce a high speed, pulleys are introduced, connected by rope gearing. With a system of this kind the driving machinery will he noiseless in its working, and the speed of the ventilator will depend only on the proportion of the pulleys.

Ventilation is now as much a part of colliery mechanical engineering as winding, or pumping, or hauling; but it must not he understood that because mechanical ventilation only is dealt with that therefore furnace ventilation is necessarily condemned. It is only when machinery is brought into use that ventilation becomes a mechanical subject, and these articles deal with none other. It is proposed to state a few special advantages obtained by machinery, leaving the advocates of the furnace to defend their own cause. Afterwards, the construction and principles of the chief machines brought at all extensively into use during the last 30 or 40 years will have to he described. And, lastly, the appliances whereby mechanical ventilators obtain their power, including engines with and without condensing arrangements, engines coupled to the machine direct, and those which do the work hy means of straps or ropes.

Mechanical ventilators have had rather an uphill fight. It is not many years since such eminent authorities in the engineering world as Mr. Nicholas Wood and Sir William Fairbairn, men whom we were all proud of when living, and whose memories we cherish now that they are dead, declared that no machine could pass through a mine any such quantity of air as 250,000 cubic feet per minute. Had those intellectual giants lived a few years longer, they would have seen even greater results than that achieved. Wood and Fairbairn only expressed an opinion in their day which, perhaps, even the inventors of some of the machines would hardly have disputed. Mechanical ventilators, the best of them, have surpassed the expectations of those who introduced them. And this, as it is hoped will be shown further on, is owing, not so much to improvement in the principle of the ventilator itself, because Guibal, for instance, is, to all intents and purposes, what it was a quarter of a century ago, but to increase in size and advancement in the moving mechanism.

Formerly a machine 30 ft. in diameter was considered large, now we have them 50 ft. In the early days any engine was good enough, but now it is rightly considered that a ventilating machine is incomplete and imperfect unless it has a high-class engine attached. The general opinion arrived at now is that machines can be constructed to deal with practically any quantity of air; certainly any quantity that can be obtained by other means, and that as to economy in the consumption of fuel the furnace has the advantage for very deep mines, and the machine has the advantage for mines which are not so deep. What the exact depth is at which the two systems become about equal has not been satisfactorily determined, and probably never will, because it would depend not only on the different circumstances of different mines but also on the varying conditions of any one mine.

Mr. Atkinson, late Government inspector of mines for the Durham coalfield, who was the foremost man of his time as a contributor to mining literature, has given his opinion, based upon many years' experience, as follows: Assuming that the sources of loss are the same in each case, that is, that the loss of fuel in a furnace from the cooling in the upcast shaft is equivalent to the power expended in overcoming the resistances in a ventilating machine; also assuming that the ventilating machine utilizes 60 per cent. of the engine power, and that it requires a consumption of 8 pounds of coal for each indicated horse-power per hour of the engine, he estimates that with an average temperature in the upcast shaft of 100° F., the depth at which machine and furnace are equal in efficiency would be 960 yards, with an average upcast temperature of 150° F. the depth would be 1,040 yards, and with an average upcast temperature 200° F. the depth would be 1,130 yards. Then with a higher consumption of coal per indicated horse-power per hour the results would come out differently. Taking the same average temperatures of the upcast shaft, viz.: 100°, 150° and 200° F., the depths would be for 10 pounds of coal, 760, 830 and 900 yards, whilst for 12 pounds of coal the depths would be 640, 760 and 750 yards, showing practically that as the consumption of coal increased the depth at which the two systems became uniform decreased. But if we follow this calculation up, and instead of taking an outrageously high consumption such as either 8 or 10 or 12 pound per indicated horse-power per hour we take a reasonable expenditure of fuel, what do we arrive at then?

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

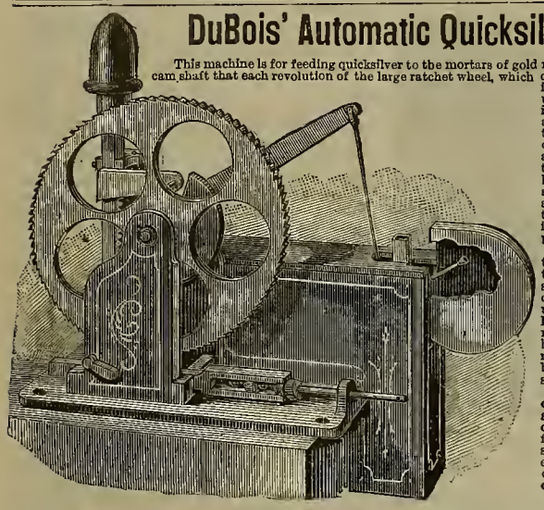
CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

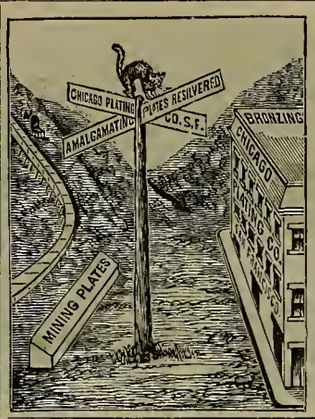
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; i. e., from every one to four minutes.

Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents

22 & 24 Fremont St., San Francisco.

Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.



Amalgamating Plates

REPLATED OR MADE TO ORDER BY THE

CHICAGO PLATING CO.

Pacific Power Building, 23 Stevenson St., S. F.,

And 261 & 263 Randolph St., Chicago.

Having opened a branch house in S. F., the largest Plating and Polishing Establishment on the Pacific Coast, with all the latest improvements in machinery for plating in Gold, Silver and Nickel, with 12 years' experience in the Eastern States and Europe, we claim that our Silver Plated Amalgamating Plates are the most economical, durable, and successful Plates on the Pacific Coast for saving gold. Every description of metal goods plated in the most durable manner by the

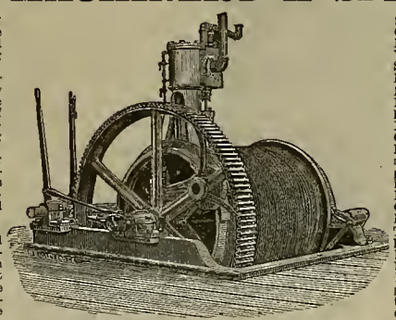
Colorado Iron Works,

MANUFACTURERS OF

ENGINES, BOILERS, RAILWAY CAST AND WROUGHT WORK, BRIDGE WORK, BOLTS AND BOLT ENDS, BUILDING WORK, ETC.

MINING MACHINERY A SPECIALTY.



Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupellation Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.

COLORADO IRON WORKS,

P. O. Box, 1921, - - - - Denver, Colorado.

"FRUE" ORE CONCENTRATORS.

I have on hand and for sale, at LOW PRICES, a number of the above Concentrators, of the latest pattern and in perfect order.

JOSHUA HENDY,

Manufacturer of Quartz and Saw Mill Machinery

AGENT FOR "BAKER'S" ROTARY PRESSURE BLOWERS,

Best Polished Shafting from the Akron Iron Company, Ohio. Also, "P. Blaisdell & Co.'s" Machinists' Tools. A Large Stock of New and Second hand Machinery at Machine Works.

Nos. 49 and 51 Fremont Street, San Francisco.

STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequaled strength, toughness and durability.

An invaluable substitute for forgings or cast-iron requiring three-fold strength.

Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.

15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings.

CRANK SHAFTS, SHOES, DIES and GEARING specialties. Circulars and Price Lists free. Address

Scientific Press

Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

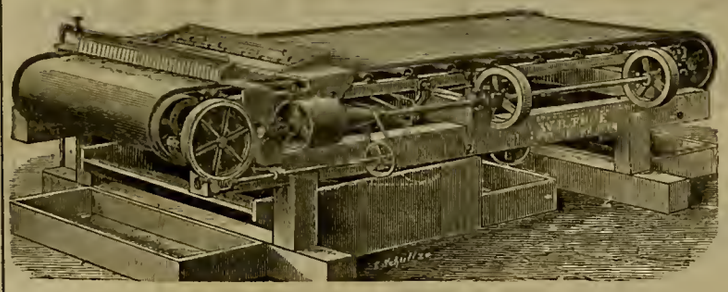
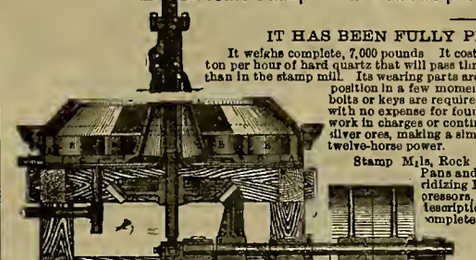
SHEET IRON PIPE.
FRANCIS SMITH & CO.,
Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand
SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.
SHEET IRON PIPE.

$1,000 CHALLENGE!


THE FRUE ORE CONCENTRATOR.
Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.
☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Huckley, Spiers & Hayes, 220 Fremont street
ADAMS & CARTER, Agents. Room 7 No. 109 California Street, S. F.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery


HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

New Mining Horse Power.

The demand for a better Horse Power, suited to more general use, has resulted after much experiance in the above machine, which we can recommend as a First-class Hoisting Power, under complete control of man tending bucket, through levers connecting with brake and clutch.
This power is light and strong, so that two or more horses can be used for crushing ore or other work.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents fu DEWEY & Co.'s SCIENTIFIC PRESS PATENT AOENOY, 252 Market St., S. F.

FOR THE WEEK ENDINO JUNE 27, 1882.

260,168—CLEANING CLOTHS AND OTHER FABRICS—Mrs. E. I. Couch, S. F.

260,090—DEVICE FOR OPERATINO STEAM ENGINE GOVERNORS—Wm. M. Ferry, Park City, U. T.

260,021—BOOT OR SHOE—Henry C. Holbrook, S. F.

260,026—ADJUSTABLE STEAM CUT-OFF VALVE—W. D. Hooker, Oakland, Cal.

260,200—APPARATUS FOR REMOVING SANDBARS IN RIVERS, ETC.—John H. Huffer, Jacksonville, Oregou.

260,217—BASIN-BIB—E. O. McGlauflin, San Jose, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in tbe sbortest time possible (by telegrapb or otherwise) at the lowest rates. All patent business for Pacifio coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among tbe patents recently obtained throngb Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

BASIN BIBB.—Eugene O. McGlauflin, San Jose. Heretofore basin bibbs bave been made of several kinds, all of whicb are divided into two classes—self-closing, or percussion, and tbose wbicb do not close of tbemselves, called "compression." Tbe objection to the latter is that tbey may be left open by careless persons, thus causing a great waste of water, and even when not left open they usemuch more water than tbe self-closing, as most persons leave them running a longer time than they would if required to bold tbem open. Thus the compression hibb is expensive wbere water bas to bs pumped or otherwise brougbt to the basin at any considerable cost. The principal objection to the self-closing or percussion bibb is the thumping noise made in the pipe hy the sudden stopping of the column of water in the pipes, which, by its force, sometimes bursts strong iron pipes. The object of Mr. McGlauflin's invention is to supply a noiseless percussion basin bibh, tbere heing an air chamher in the handle of ths hibh. This bibb opens much easier against a heavy pressure of water than the ordinary percussion hibb, because tbe air in the chamber, being elastic, readily yields to tbe pressure on the handle and allows the valve to open, while the ordinary percussion bihb requires the water to be pushed back hy the valve until some escape is found for the water.

R. J. JONES, Superintendent of tbe Northern Belle, was thrown out of his buggy on the 4tb, and so seriously injured that his recovery is donbtful. Mr. Jones was formerly Superintendent of the Sierra Buttes, and is one of the best known miners on the coast.

AUGUST 1st, Denver's great national mining and industrial exhihition opens. Tbe structure for it is of iron and hrick, is in the form of a cross, and is 500 by 310 ft. in size.

Back Numbers Wanted.

We will pay 10 cents a copy for tho following numbers of tbe MINING AND SCIENTIFIC PRESS: Volume, 13; year, 1865; number, 1. Volume, 13; year, 1869; number, 5. Volume, 20; year, 1870; numbers, 1 and 26. Volume, 22; year, 1871; number, 1. Volume, 30; year, 1875; numbers, 2, 3, 4, 7, 10, 11, 12, 13 and 15.

DEWEY & CO.,

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walle d witb aquaria is constantly receiving accessions of new fish and otber marine life. The number of sea lions is increased and there is a better chance to study their actions. Tbe pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

THE State Mining Bureau, No. 212 Sutter street, is open to tbe public from 10 o'clock A. M., to 5 o'clock P. M daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

ANNUAL STATISTICIAN of 1882.—"It is tbe most complete and accurate work of its kind in tbe world."—*S. F. Call.* Address L. P. McCarty, 502 Taylor st. Price, $4.

EXCURSION
TO ALASKA.

The August trip of the Steamship IDAHO to Alaska will be made a special feature of interest for tourists and pleasure seekers. In additiou to her regular ports of call (Wrangel, Sitka, Harrisburg, etc.) it is intended she shall visit Glacier Bay and other points of special interest.

The trip from Pugot Sound to Alaska, instead of being, as many imagine, rough and tempestuou', is made nearly the whole distance on inland waters, which are as smooth and unruffled as a mountain lake. The scenery is a magnificent panorama of wondrous grandeur. The noted and celebrated points of interest in California and other States dwarf into insignificance in comparison with the wonderful sights and towering mountains in this wonderland of glaciers, icebergs, Aurora Borealis and nightless day. Only a limited number of passengers can be taken from San Francisco, as a large number of tourists have engaged to go from Portland, Victoria and other northern ports.

Those desiring to engage passago will please register their names at the Company's Ticket Office, 214 Montgomery street. No name accepted unless accompanied by a deposit of $20 on account.

The fare for the round trip has been fixed at a low rate of $115, whicb includes meals and a berth.

Passengers will take the DAKOTA, which leaves Broadway Wharf July 29th, at 2 P M., and transfer to the IDAHO at Port Townsend about August 3d, reaching San Francisco on the return about August 25th.

GOODALL, PERKINS & CO.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS.

☞ Send for Pamphlet showing methods of testing the different qualities of all Powders.

The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT. No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." It is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

CALIFORNIA VIGORIT POWDER CO., ENGLISH & WRIGHT, Agents

No 327 Pine St., San Francisco.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞ Triple Force Caps and all Grades of Fuse.

WATER JACKET SMELTING FURNACES

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims we make.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.

Send for circular.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

Oscillating Stamp Mill.

It has no Stems, Cams, or Tappets, and adjusts itself to the wear of the Shoes and Dies.

For simplicity, economy, durability and effective working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power. Awarded First Premium and Medal at Mechanics' Fair, S. F., 1880.

Manufactured by
F. A. HUNTINGTON, | FRASER & CHALMERS,
220 Fremont St., S. F., Cal. | 145 Fulton St., Chicago, Ill.

Improved Patent Grinding and Amalgamating Pans, Concentrators and Gold Amalgamators; also, Steam Engines and Mining Machinery of all kinds. Send for circulars.

F. A. HUNTINGTON,
220 Fremont Street, San Francisco, Cal.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

☞ Send for Circulars. ☜

SHINGLE MACHINE.

For simplicity, durability and rapidity of action, these Machines have no equal, cutting from 3,000 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

TONITE.

From Mersey Railway Contract.

SUB OFFICE, 17 JAMES ST., LIVERPOOL, June 7, 1882.

I have pleasure in stating that your Tonite is the only explosive in use on the works, and that it is giving every satisfaction. The men do not suffer any ill effects from the fumes of the smoke after firing, and can at once return to their work. (Signed.) JAMES PRENTICE, Agent.

From Severn Tunnel Contract.

PORTSKEWET, ENGLAND, June 3, 1882.

I have much pleasure in stating that I am thoroughly satisfied with your Tonite. I have been using, for some months 10,660 lbs. per month, and I prefer it to any other explosive I have tried. The men are able to return to the faces within a few minutes after firing their shots. (Signed.) THOS. A. WALKER, Chief Engineer.

From "James Watt" Dock, Greenock.

GREENOCK, SCOTLAND, June 5, 1882.

I have pleasure in stating that Tonite has been used on the above works since they were started, over three years ago, and still in use. I can testify to its advantages in regard to strength, safety and expedition, in charging. I have found it as effective in Rock, Bowlder, Clay, splitting up Bowlders, breaking Metal, etc., as any of the explosives I have ever experimented with. (Signed.) JOHN WADDELL,
By WM. KERR, Manager.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, JULY 15, 1882. VOLUME XLV Number 3

Mines and Stocks.

It is a noticeahln fact that while tho mining camps and districts of thn conntry are at present very active, and developments are everywhore heing prosecnted, the husiness of the stock exchsnges in New York, Boston, Philadelphia and Chicsgo is falling off. In other words, tho mines themselves are flonrishing, while the mining stocks are not. And it is noticeahle, moreover, that as the mining industry has increased its area and become more prominently recognizsd, the mining stock husiness has incressed its area, but has become contracted in dimensions.

The truth of the matter is that there are apt to he more poor mines stocked and listed than thore are good ones. Good mines nearly all find individnal purchasers, or they are stocked and the stock honght hy few.

The investing pnhlic found to their cost that many of the companies whose stock was presented for their consideration at the exchanges, were hollow shams. Many of the properties had no present or futnre valne other than the fictitions price placed upon stock hy manipulators. The few good mines which were listed were quickly taken up hy those who knew the facts concorning them. The speculative mines were left for people to speonlate on and there was little money to he made out of these mines themselves aside from what the fluctnations of the stock permitted.

There never was a time when there was a hetter opportunity to prosecnte legitimate mining than now. The field is wide. There are thonsands of claims which oan he cheaply pnrchased; there is a market for all products; transportation fscilities are increased, and the industry is on a hetter hasis than ever hefore. Of course, every one cannot hny a whole mine, bnt every one can exercise some cantion ahout what he is huying. Purchasing speculative stocks is one thing, and hnying an interest in a legitimate mining property is another.

The Eastern Stock Exchanges aro finding out thst the people are not so ready to huy anything offered, as they nsed to he, and they have heen compelled to drop from the lists many mines which never had any business there.

If it were possihle—which it apparently is not—for the Stock Exchanges to make close examinations into the nature of the mines, as well as into the characters of the promoters, then people would have some faith in pnrchasing. Bnt now, all that hss to he done to list a mine is to pay a certain amount of money; then the stock is pnt np for people to huy, and its fluctuations are officisIly chronicled.

This shonld not he so, hut is so. Bnt now, we should judge, from what we read of Eastern Exchanges, it is found necessary to inaugnrate a sort of reform, otherwise people will have nothing to do with the stocks, having been swindled too often hefore.

Tyler's Wheel.

The wheel shown in the engraving is of the class generally termed vortex wheals. The water entera the wheel from the penstock throngh the pipe A, the qnantity being regulated hy the sliding gate, D. In passing throngh the wheel the water acts on the convex sides of the buckets and passes down into the tail race. To prevent accidents to the wheel from small pieces of wood, pehhles, etc., which might happen to get into it, the part BC of the casing, is made separate and is hinged at C so that it will open from the wheel at B, and allow the 'small pieces of rnhhish to pass.

The popularity of this wheel is its hest recommendation. It is hoth cheap and durahle, and easily transported to remote places; hesides it can he set running with very little expense. Seven sizes of this wheel are made hy the Union Iron Works of this city, viz: 9 in., 14 in., 18 in., 24 in., 30 in., 36 in., and 48 in., in diameter; varying in power from 8 HP., with 14 ft. fall, to 279 HP., with 50 ft. fall.

Brake for Winding or Hauling.

Mr. C. M. Percy, a member of the Institute of Mechanical Eogineers, in one of a series of artioles nn the mechaniosl engineering of collieries, contrihnted to the *Colliery Guardian* a description of the hrske patented by Mr. Thos. Borns, of Leigh. Mr. Burns contends that with his hrake there is less first cost and less cost in working. He nses no steam; the hrake can he worked withont any nndue exertion hy the engine man, and is sn constrncted that either an enormous for oe or a very slight one

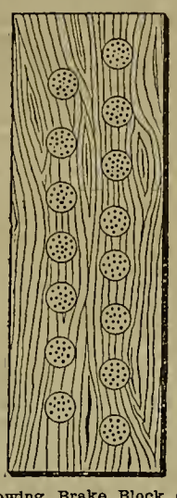

Fig. 1.—Showing Brake Block and Holes Filled with Sand.

can he put on, and it is done without any sudden jerk. Any hrake arrangement in which the power is applied hy the foot must he gradnal in its action. The principle of the old form of hrakes is to apply the ruhhing surface as long as possihle, in some cases all round a circumference amounting to over 60 ft. Theory says friction is not dependent upon surface; practice proves that to some extent friction does depend npon snrface in contact. The real fact is that with reasonably small hearing as much friction is ohtained as on a large surface. In

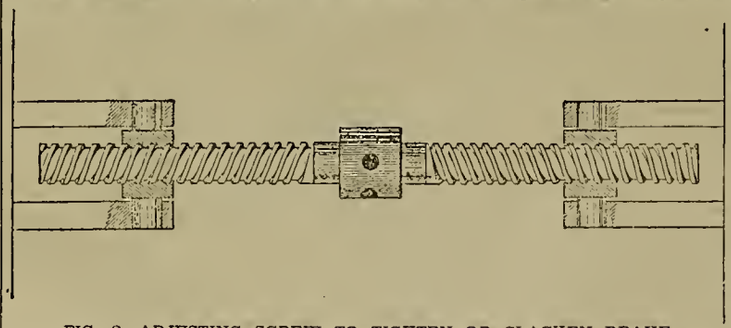

FIG. 2—ADJUSTING SCREW TO TIGHTEN OR SLACKEN BRAKE.

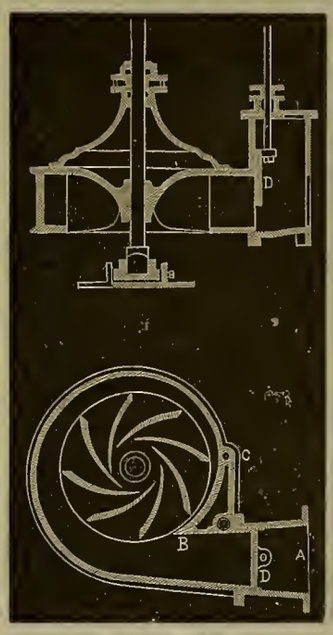
Bnrns' hrake, the power is applied on a small part only of the lower surface, not exceeding two feet. The result is, instead of requiring a movement of at least an inoh to enable the hrake to come off, the slightest movement will accomplish this, and the leverage can he proportionately increased. This is so, as with a strap half ronnd or all round a vertical fall or rise must he considerahle to effect clearance, whereas with a hrake hlock acting on the hottom, almost a shade of movement gives perfect clearance.

Instead of iron straps and hemp ropes, the Burns hrake haa a hlock of pitch pine, ahout two feet long hy one foot deep hy six inches thick, heing exactly one cubic foot, and holea are hored into this hlock vertically from the top, and these holes filled with sand (as shown in Fig. 1 of engravings), which keops the hrake surfsce olean and free from greasy matter. One of these blocks will wear three months, and can he renewed in a few minntes. These hrakes will essily give a leverage of 200 to 1, which sffords a retarding force of five tons, and a separate hrake can he attached to eaoh hrske ring, thns multiplying the power to any extent. By means of the adjusting sorews, shown on Fig. 2, the brake can be tightened or slackened hy



Tyler's Wheel.

the engine man himself in a few seconds, without leaving the engine-honse. The handles can he adapted to any position of the engine man.

This Burns hrake has heen in operation for three years, and is applied to all the winding and hanling engines at the Bickershaw collieries, snd has never failed. It firmly holds the heaviest load upon the largest engines, and the enginemen, who after all are the hest judges, having had large experience with all kinda of hrakes, unanimously prononnce this the most easy for them and the most efficient they have nsed. One enthusiastic engineman said, as compared with any other hrako he had tried, it was as good as sixpence a day to him. The appliance has already, although a comparatively new invention, had an extensive adoption, heing in use in various parts of England and ahroad. An eminent firm of engineers have an arrangement with the patentee wherehy they attach the hrake to all the winding engines they make, and in every oase it has given entire aatisfaction. Some time ago the writer had to do with the sinking of two large shafts over 600 yards deep, with one flat rope in each, and although no accident resulted, the hrake appliances were a source of some anxiety. Working with one heavy rope and sending down large hoppitts of hricks and other materials was a serions tax upon the nrdinary foot hrake, and the wesr of hemp rope was something very serious. Steam hrakes may be all right in osses of regular winding to stop a loaded osge snddenly in case of emergenoy, but for lowering either men or materisl in a sinking pit are not so oonvenient as a foot hrake. And in any case steam hrakes are only good heoanse they are powerful. No one will argne that a steam hrake shonld he nsed in preference to a foot hrake, if the latter gives equal power. In Burns' hrake we get the power of the steam hrake combined with the economy and convenience of the foot hrake. The object of a hrake on a winding engine is three-fold—namely, first, to stop speedily the moving machinery; second, to do this without jerking; third, to effectively hold in any position the heaviest load that oan he put on the cage. Tested in this manner, Burns' hrake is, practically, a perfect one, and deserves the success it has alresdy attained hy its general adoption, and deserves more—namely, adoption at those collieries to which its snccess has not yet penetrated. Thanks are due to Mr. John Smith, the general manager of the Bickershaw oollieries, for kindly allowing these psrticulars to he ohtained, and this opportunity is taken of congratulating him upon haviug in Mr. Burns an engineer with the genius and practioal knowledge of which so substantial a proof is given in the simple and useful mechanioal appliance herein described.

Speculation.

It is pretty well recognized now that to he successful in dealing in stocks, there must he no lack of money. The man with the longest purse wins in the long rnn. The man with the shallow purse has no chance against the heavy money hags of the capitalist. When there is a contest, weight tells, and there always is a contest in the stock markets.

The men of moderate means surrender these moderate means, in time, to the man of capital. He, in addition to knowing how and where to pull the wires and "manipulate," can command the ready money or credit to carry out his schemes at suitable time, so the profit will fall to him alone.

It has heen our experience in San Francisco, where thousands poured their all into the whirlpool of stock speculation, that once within this magic ring, they gradnally drew to the great center where their money disappeared into the oommon receptacle. Here, as elsewhere, the rich grew richer; the poor, poorer. Onr experience has heen more disastrons than elsewhere, because so widespread was the contagion that all were affected.

There is no snrer or better game for rich men to make money fast than from stock speculations. And when one is reminded that mere fluctuations in valne form the hasis on which the money is made, and that production is not considered, it hecomes apparent that where one ie enriched another is impoverished.

Of conrse, there mnst he exceptions to the rule of the poor man heing loser in these unequal contests, otherwise there would he no "market;" hnt the general result is, aa all know who have given the subject any attention, that the smaller the purse, the less the chance of success.

With this experience, it wonld seem almost unnecessary to caution men of little meana to steer clear of the sea of speculation; to attend to their legitimate calling, whatever it may be, and to leave atock speculations of all kinds to men who can afford to lose money without injustice to their families. Legalized gambling, carried on hy wealthy men, affects them alone; hut when poor men are drawn in, innocent families suffer, too. Poor men have no hnsiness to indnlge in the luxury of speculation in stocks of any kind.

The System of Working in Salt Mines.

The present stato of the salt mines in Cheshire, owing to the elips and sinkings conetantly going on, and which promises ultimately to ewallow np a vast area of ground now oovered with houees and buildings, givee to the district a more than ordinary intereet. Little more than a year ago, near to Northwicb, there was a suhsidence of a moet extraordinary character, eo that the River Weaver, and what is known as the Top Brook, were lowered fully a foot over 160 acres in ahout four hours, whilst there was an enormoua sinking like a vast shaft, into which it was computed that not less than 600,000 tons of water rushed. The shaft, or hole, formed by the subsidence wae fully 200 ft. in diameter, and eloped gradoally down, and, in addition to the water, it ahsorhed about 40,000 tons of earth. Not so long since a church, a chapel, and some other buildinge were condemned as unsafe, and as tbe brins and salt are drawn away tbe snhsidence will go on increasing in a corresponding ratio. The prospects of the Chesbire salt miner are, therefore, hy no means cheering, for the mines at almost any time are liahle to be inundated witb water, and on the occasion to which we have referred the water rushed into an old mine, and forced the eeparating barrier hetween it and one that was being worked ; the men, however, eecaped, but the foreman, who afterwards went down the shaft to ascertain the amount of damage, found tbe water up to his breaet when he got into one of the chambere at the hottom. In modern salt mines there are generally two shafts, from 12 tq 16 yarde apart, witb a pumping shaft for clearing the surface water, which only goes down as far as the latter descends. The eurface work is covered over as a protection from rain and snow, and the sbafts are tubhed helow the point where the surface water is likely to penetrate. The cast-iron tubbing is similar to that nsed for coal mines, hut instead of heing cast in segments it ie now cast in complete cylindere. The bsds of salt vary from 15 to 18 ft. in Cheshire, and the mode of working is hy driving out in tbe npper part bstwesn five and eix feet high, and this is called the rooting, which is followed up by what is termed the benching, so that pillare of the rock salt are left wbere they are considered neceasary. In driving the roof eome holing and cutting is done witb the pick; hut thie is not much, as powder is ueually resorted to, and then the roof is made into shape with the pick. The hsnching varies from 9 ft. 3 in. to 12 ft. 3 in., and is blown off hy a succession of sbots fired in a slanting direction from top to hottom. In one of the largeet mines the number of men employed ie abont 80, and amongst that number about 100 lhs. of powdar is used daily. In making sbot holes tbe drills used are some 8 ft. in lengtb, pointed at eacb end, and tbe diameter heing larger in the middle no hammer is required. Whilst uncharging the sbot tbs powdered salt made in drilling tbe bole is put next to the powdcr, and then coarser grained salt upon tbat; the charge is tben fired hy a straw filled with fine powder lighted from a candle. Unlike what is usually the caee in ealt and other mines, the men only retire a few yards whilst the shot goes off, for the salt does not go far away when it is bronght down. Extsnsive pillars have to be left, and that on an extenaive ecale.

At the principal mine in Cheshire, tbe pillare are in oval form, eome of tbem 640 yarde long hy 280 hroad, extending over about 40 acree. The hight of each pillar ie ahout five yarde, and of various hreadtbe and lengths, and are eet at variouo distances apart. The thickness of etrata they have to eupport from the baee to the eurface ie more than 100 yarde. At an other mine, where the hight of the working is ahout 6 yarde, and where the rock-ealt roof ie not quite firm, the nillars are 10 yarde equare and 25 yarde apart; hut there are eomo 12 yarde square and only 18 yarde apart, eo as to more perfectly render the roof eafe. Iron tramwaye are used underground for the conveyance of the rock ealt, hut the rails are often fixed to pegs let into drill holes in the rock ealt, so that in euch caees eleepere aro not ueed. The workinge are, ae a rule, free from carhonic acid gae, and at only one place hae fire-damp heen met with, and that on only one or two occaeions. The lahor ie hy no means exhaueting, and ae the ventilation ie alwaye good and the air pure, to euch an extent, indeed, is this the case, that hutchere' meat, it ie eaid, keepe quite good nnderground in the warmoet weather for eight or nine weeke. The bottom parts of the ehaft are elightly bell-mouthed, so ae to allow of the bucket aecending without catching. The ventilation, notwithetanding the smallneee of the shafte and the want of ventilating powere and partitione for eending the air round the workinge, ie usnally, excepting it may he for ahout two monthe in the hotteet part of eummer, when the air occaeionally hecomes etagnant, aod thie may continue until the cold weather eete io, ahout September and October. The winding ie done by ordinary eteam enginee, eome of them beiog provided with indicatore to ehow tbe poeition of the load in the shaft, and have good brakee, which, when the eteam is not up for winding rock ealt, are used for lowering and raieing the minere hy counterpoiee. Flat bemp ropee are used, being preferred to iron, whicb the ealt cansee to rust, and in eome of tbe equare-timbered ebafts, a eignal wire ie placed, with etaples, in one corner of the caeed part, eo that tbe buckete, whicb are round, do not touch it; and when the ehafte are circular, but witbout metal tubbing, the wire is let into a groove cut in the marlstone and rock salt. But where the shafts are emall and cased with metal cylinders, wbich have no such groove, then a eignal wire is not used, as the huckets would catch it. It bas, however, heen found by experience, that a signal wire may he diepensed with, eeeing that the rock ealt, together witb the metal tubbing, are good conveyors of eound; so much so, tbat the men, wben shouted to from the eurface to the hottom, nearly 300 yards, can understand what is said. The deepsst salt mine now heing worked, is etatsd to he the Duncrne, in the north of Ireland, whicb ie 295 yards from the surface, the thickness of the rock salt heing 40 ft. The pillare are 10x12 yarde at the top, widening to 14x12 at the hottom. As to pressure, it has heen found that, at 110 yards from the surface, with a thickneee of 22 yards of rock salt left ahove the pillare, a width of 25 yards hae been found tc stand secure, and the proportion of 10x10 yards, equal to 1,000 sqnare yards for each pillar, left in eacb area of 35x25 yarde, eqnal to 1,225 equare yards, being in the proportion of 1 of pillar to every 12¼ excavated. In the case of crnsbing, it generally begineby cracks or breaks at the corners of the pillars, and then cracks come on in the roof; hut in thia state the rock salt generally adheres togetber, hut the roof "creeps" nearer to the floor, and the parts of the shafts whicb are in rock salt hecome smaller in diameter.

The temperature of the rock salt minee is very moderate, and must be pleasant at all times to work in, so that eight bours' labor daily can not he coneidered a hard task. In Cheshire the temperature, at depths between 110 and 160 yards, varies from 48° to 55° Fabr. with the dry bulb thermometer, and between 44° and 53° with tbe wet bulb, the bydrometical difference hstween tbe wet and dry hulhs varying between 1° and 6°, but variations bave heen fonnd witb hoth bnlbs, depending upon the part of tbe mine in which the observation was taken, the number of miners' lights, ebota, etc. As to the actual thickness of the rock salt, in some places in Cheshire it is said to be nearly 30 yards thick in the top hed and the same in tbe hottom one; hut at Marston and Wincham it is about 30 yarde, wbilst further south the top hed decreases five yarde in a quarter of a mile, and at the most southerly pits the top hsd ie only 16 yarde in thickness. But tbetotal thickness of all the hede and lumps is estimated at ahout 180 ft. At the present time work is going on much ae usual, hut no one csn say how long thie will he the case, for tbe subeidence going on not only threatens the immediate locality of the mines, but the town of Northwicb as well, whilst the greatsst anxiety is felt hy the inhahitants botb in the town and district, seeing that the locality ie oompletely honeycomhed hy ahandoned salt minee, whilst the subsidence has been such that honees and buildings and ohimney-stacks that once were connected witb the salt works bave disappeared, or merely show wbat were oncc their lofty summits.—*London Mining Journal.*

Outlook for Sierra County Gravel Mines.

The Sierra county *Tribune* says: The outlook of Sierra county'e gravel-mining intereete never seemed more favorahle that at present. The Bald Mountain mining company of Forest City hae diehureed many bundred thoneande of dollars to ite ebareholdere, hesidee contributing largely to the support of thie town. The company hae now encountered a new pay cbannel, eeparate from the old one, which, from present looke, probably coursee througb the entire length of the claim, and being etill richer than tbe old hlue lead. It ie eome 50 ft., or more, lower than the old channel. This important find (the reenlt of curioeity on the part of Superintendent Wallie, more than anything elee, to eee what wae helow the lava flow that had, in the paet, caueed eo much vexation, and at timee uncertainty, in the minde of the management,) comee very opportune, and will, eo eoon ae opened up, add largely to tbe gold production of thie eplendid paying property. Thie channel liee to the eaet hetween the Bald Mountain and Bald Mountain Exteneion minee. In the main tunnel of the former claim, the (old) cbannel is panning out as well as ever. The opinion of many ie that the great blue lead coursee down the ridge from eomewhere near the vicinity of Gold Lake, and then dividee itself at different pointa wherever tbere are lateral ridgee making out from tbo eame. Thie may account for the frequent deposite or hreak-oute of gravel found at variouo placee each eide of the ridge, and also in the canyons and rivere—all of which produce channel gold, the eame ae found in the Bald Mountain Exteneion mine—running up into nuggets many ounces in weight. Some 12 milee up the ridge, in the vicinity of American Hill and at the Savage mine, there appeare to he two dietinct leade—one overlying the other—whicb consist of tbe old hlne and red granite leade. At American Hill the red lead proved exceedingly ricb, tbe gold aesaying 954 fine. At all points along tbe line of tbie auriferoue cbannel work ie progreeeing ae rapidly ae circumetancee will permit. Moet of the companies are without tbe aseistance of capital, eo much needed in tbe development of mines. The Savage company, composed of Virginia City parties, ie now einking down into the channel, having cut the rim of hard quartzite granite. The euccese of tbie company will, to a certain extent, prospect the ridge for many mines. A more inviting field for capital than tbie locality cannot be found on tbe Pacific slope.

Lassen County Mines.

From a letter of Charles E. Fairbank in the Adin *Argus* we get the following information: To the resident and many visiting Hayden hill its etructure is regarded ae peculiar. While I conaider it anomalous, and its special characteristice confined to that district, yet tbe general formation is distinguished by ite resemhlance to that of the Potosi mines, in Buenos Ayree, which occurs in a mountain of argillaceous shale and argillaceons porphyry, which hns produced in silver $1,300,000,000. Also the next largest, the Gnauaxuato, which intersecte principally argillaceoue shales.

Hayden hill is situated in Laeeen county, 15 miles from Adin, in Modoc county, and is ahont that distance from the soutb line of Modoc county, with good wagon roads to the top of the mountain. In form it ie egg sbaped, somewhat elongated, witb outlying henches, particularly on the northern and eastern sides. The monntain is isolated, lying about due east and west. The western and smaller end is appropriately emhellisbed hy the pet of the district—the Juniper—with its rich fissures of auriferous deposits, reaching sometimes as bigh ae $20 to the pound of silicions gravel.

The hill proper is an upheaval of argillaceoue elatee and argillaceous porphyry. These clays are in a complete brecciated condition of varying hardness, from the extremely hard, compacted blue slate to the eoft, plastic clay. Alum sbale, containing pyrites, ia also met with, and a friahle quality of agamatolite—a vast variety of colore and shades, lending a pecnliar beauty to the oonglomerates.

Tbe porpbyritic is mnoh more finely brecciated. These two classes of rock are usually found as opposing walls in the trend of the best defined fiseuree, wbich have a northeasterly course, with numerons lesser fissures in all directions.

Tbe gangue is eilicious gravel—quartz in masees or nodnles—clearly showing infiltrated formation. Unmietakahle evidences of epringe, called "blow-oute," sbow the prohahle source of the silicates and fluor gold. The many rich streake, with a nearly even distrihution of gold througb tbe major portion of gangue matter, are plain examples of nature's process here. Specimens of sheet qnartz crystals are frequent, and all tbe quartz is in detached massee. Varieties of pure white and deep red, epongy quartz are found. But little of this quartz carries gold, although the Golden Eagle mine is said to have taken ont of its earliest workings some 50 tons, whioh netted $80 to the ton; and again, the Juniper bas a small quantity of $10 to $20 rock. I have seen but little, however, oarrying the metal, this occurring in tbe loosé, shifting gravel, with numerous rich, clayey streaks.

The ground througb which the old Providence tunnel was driven 800 ft. on the northwestern ledge, and immediately joining the hill, ebows the slate in their undisturhed horizontal position.

Tbe original discovery of gold was made at a spring on the Providence ground, and located as a placer claim. Seventy-eight thoueand dollare wae taken from it and mucb more from shallow fissures higher up the hill. Afterward ahandoned, it was left for those of greater faitb and courage to sink deeper, where richer strikes and continuous pay rewarded their efforts. It would douhtleea he difficult to make the average mining man believe that minee of any extent or permanency exieted in thie volcanic, rock-honnd country, yet very slight developmente give evidence of increaeed richneee as depth ie attained, and while it ie clear that infiltration ie well defined, yet general permeation of the fisenre vein at lower levele are euggested ae bighly prohable by the very satiefactory resulte at a depth of 300 ft.

The npper eurface fisenrea are narrow, hut, eo far, have invariahly widened witb depth—tbe maximum widtb being abont 20 ft.

One thing muet not be loet sight of: The working of theee minee hae heen prosecuted with meager capital, or entirely upon the gold ae extracted; no eyetematic "opening up" has been tbought of, eo extraction hae followed coneietent only witb the safety of the mine and miners. So our vieiting mining man, in eampling, makes a queetioning eide note of the rich etreak, then averagee the other gangue matter—taking gravel and looee country rock (and that in the few openings in the mine), and is bardly satiefied with the result. He cannot accept tbe record of what hae heen accompliebed by ownere ae any part of a basie for calculation; bence the propertiee fail to realize euch figuree as the ownere and close obeervere know them to be intrinsically worth, and which eume will probably he extracted in the economical way now employed, although extended time will bo required. The extraction of gold ie by hoth mille and araetras—three five-stamp batteriee and a number of araetras, all having the advantage of a good water power three milee from the minee. There ie aleo a five-etamp battery moved by eteam power and an abundance of timber everywbere.

Coneiderable caro ie ueed in eaving the valnable part of the vein material, it being graded and the finer quality at once etored. The medinm-eized rock ie ecreened; afterward the whole of the rock, apparently clean, ie waebed in tanke and relieved of the preciouo clinging particlee, eacb etep paying well for the handling. The fine gravel "concentratione" (?) reacb the hattery or araetra in due time. Thie waching bae been fonnd eo eatiefactory tbat it will be more generally ueed tban beretofore.

There are many mattere of intereet concerning the mines and district which I will leave to others wbo will come after me, and will yet have even richer etatietical tales to tell of these slowly developing claims.

Geology of Costa Rica.

A profeseional visit to Costa Rica, in connection with tbe extension of Britisb mining enterprise to that country, has recently heen made hy Mr. George Attwood, F. G. S., A. M. I. C. E., and at tbe laet meeting of the Geological Society be gave an intereeting account of the geology of Costa Rica, which was accompanied hy an appendix by Mr. W. H. Hudleston, M. A., F. G. S. It appears that Mr. Attwood commenced hie journey at the town of Punta Arenas, on the hay called Nicoya gulf. This etands on a peninsula compoeed of a calcareous sandstone covered with a dark sand, consisting of quartz grains, magnetite and decomposed felepar and augite. Inland is an igneous rock wbich occupies hefore long both banke of the Rio Barranca, and on the left hank extends to the sea. It is a green stone containing porphyritic crystals of augite and triclinic felspar, and appears to contain too mucb eilica for a true dolorite, being rather a representative of one of the more hasic forms of the augite-andesites, resembling in eome respecte epecimens from the Englieb lake districts described hy the late Mr. Clifton Ward. On this rock, after a time, are found howldere of a hlack augite-andesite; this appeare to he identical with the rock found *in situ* in the Aguacate mountains. Here are gold and silver mines, wbich were described. In the ravine of the Rio Grande lignites are fonnd. Bslow this is a eeriee of ancient lakes, which on the Pacific slopes have heen tapped hy the Rio Grande; on the Atlantic of the Rio Rsventazon. Here, also, tbe country rock ie tbe greenatone already described, aod near Cartago there are bowldere of trachyte. The volcano of Irazu is a trachyte, probahly a quartz trachyte, forming an important huildiog etone. Augite-andesites are found at La Palma, about 12 miles northwest of tbe volcano. Irazu, a volcano at present paesive, hut with hlow-boles of gas, is hetween 11,000 and 12,000 ft. in hight. Turrialha, of ahout the same elevation, is still feebly active. Mr. Attwood ie of opinion that the filling of the mineral lodes (ancient fissnres) in the Aguacate mountains took place in Tertiary times, probably Pliocene, and that thie infiltration was contemporaneous witb tbe ernption of tbe augite-andesites in the same region. The quartz trachytes and sandstone are certainly Post-Tertiary.

The paper was illustrated by a good collection of specimens of rocks and microscopio sections, and in the course of tbe discussion which followed the readiug of it, Mr. Hilary Bauerman expressed his senee of the value of tbe eection made in a little-known country. It wae an interesting question, looking at the comparatively modern date of the igneous rock deecribed and the absence of schistose rock, wbetber the seas bad previously communicated. As for the condition of the transformed masees of rock containing minerale, he was glad to find Mr. Attwood had observed it, for he had noticed tbe same thing in Spain and North America, and thought that it had heen too often overlooked in the senrch for lodee. Prof. Warrington Smyth, M.A., F.R.S., asked upon what ground Mr. Attwood etated tbat there were no more ancient rocke than thoee which he had eeen. Had not vegetation possibly masked them, and might not there be granite rooke to furnieh the kaolin? Wae the coal merely carhonized eteme or a true lignite? Wae the entire run of the veine metalliferous? Mr. Attwood eaid that he had not himself eeen any caee of metalliferous rock like those which he had described. Very likely the oceane had once commnoicated. He eaw no eigne of granite in the country. Ae for the vein matter in the lodes, he thougbt that tbe eruptive rock and the fieenree in which these lodes occurred were of ahout the eame age. The coal wae only limited in area, hut varied from partly carhonized matter to true lignite. The eandetonee, like the coal, were only found in the ravinee near tbe volcanoes, and were of emall area.—*London Mining Journal.*

FUEL AT BUTTE.—The Botto *Miner* eaye: The fuel queetion next winter will be a difficult one for thoee minee and hoieting wo:ke which get their wood from north of Walkerville. A elight difference in favor of the coneumer will make a great difference in dividende in euch a caee as that of the Alice company, which consumes 60 corde per day, and ie now paying $7 per cord. In the couree of time, under preeent conditione, wood would have to he hauled 15 or 20 miles instead of 8 or 10, at a correeponding increaee in coet. Thie heing the caee, other methode of eolving the problem muet he arrived at, and the moet feaeible one eo far euggested is the conetruction of a narrow-gauge road by Meaderville to the moutb of Deadwood gulch, and up Deadwood gulch to a point north of Walkerville. By thie meane wood could he banled to the Walkerville companies by rail at not mnch greater expenee than $1 per cord. "If eome euch plan as this could not be arranged," eaid a prominent mining man, "it would he cheaper to ehip tbe oree hy an endless cable railway from Walkerville to mille on Silver Bow creek, juet eoutb of Butte."

THE LARGEST BOTTLE.—A hottle of 50 gallone capacity, the largeet ever blown in thie country, wae lately made at Millville, N. J.

MECHANICAL PROGRESS.

Protection of Iron from Rust.

Preparations almost innumerable have been proposed for the protection of iron from rust. One of the latest is a substance which has been invented by Mr. C. J. Davidson, of Wolverhampton, England, which is called "perryline," and is prepared as follows: A solution consisting of 2 ounces of gutta-percha dissolved in 12 ounces of resin spirit, is boiled with 5 ounces of camphor in 2 quarts of linseed oil, and to this compound or mixture thus obtained is added a solution consisting of 3 ounces of caoutchouc dissolved in one pound of turpentine, and there is added also 2 pounds of plumbago or 2 pounds of white lead, and also 3 pints of linseed oil, 1 pound of copal varnish, and 8 ounces of liquid terebine. The copal varnish assists in setting the perryline when laid on the surface to be coated with it. Perryline is applied with a brush, as in painting, or, if convenient and desirable, the article to be coated may be dipped into the liquid. The plumbago is usually employed as an ingredient in the perryline when the same is to be employed as a coating for stoves, fenders, and such like articles, which are intended to be afterward black-leaded. The white lead is employed as an ingredient in the perryline when the same is to be used as a paint, either with or without a mixture of color; and when the white lead is used the perryline dries quicker than when the plumbago without white lead is added. When applied to tin plates which are afterward to be japanned, perryline prevents the japan from rapidly peeling off, and thus appears to have the qualities of a cement, in addition to being an anti-corrosive coating for iron. When used as a coating for iron on which rust has previously formed, it is preferred to employ stronger solutions of caoutchouc, gutta-percha and camphor, by using, say, 3½ ounces of caoutchouc, 2½ ounces of gutta-percha, and 6 ouncee of camphor, instead of 3, 2 and 5 ounces of such ingredients respectively, as before stated, the other ingredients being kept as before. The loose rust should be brushed off, and the perryline, when laid on, will form, in combination with the adhering rust, a cement which will prevent further oxidation taking place. In this case it is preferred to coat the iron twice with the perryline before painting. The perryline dries without heat, and does not readily crack or chip off the surface on which it is laid; it resists moisture or atmospheric influence, and is said to retain its anti corrosive and adhesive qualities for a long time.

Driving Belts.

Prof. J. Banschinger publishes the results of a series of tests of the tensile strength of different sorts of belting made in the Mechano-Technical Laboratory at Munich. In making a graphic representation of the results by setting the loads per square inch on a horizontal line and erecting verticals corresponding to the elongations at the different loads, the curves thus obtained show considerable differences for leather, India-rubber and cotton belts. All these materials stretch more at first, with light loads, than afterwards. The lines, therefore, are more curved at the beginning, and afterwards approach more to a straight line. But with leather belts the approximation to a straight line begins at once, and is more pronounced than with India-rubber or cotton belts, showing that they stretch from the beginning more in proportion to the load, and possess a high degree of elasticity. The conclusion drawn from the tests by Prof. Bauschinger is that India-rubber and cotton belts are inferior to leather, not only as regards elasticity, but also as regards tensile strength, for the same section, and only attain in strength that of medium or inferior sorts of leather. By cementing and sewing the ends, leather straps lose one quarter to one-third of their strength, if the joints are made with great care.

THE BEST TRADE TO LEARN.—In the third annual report of the Jersey Bureau of Labor Statistics, just published, it is shown that machinists have higher earnings than any other tradesmen, the average for machinists being $779 10 per year, against a general average of $428.58 for all the trades. Bricklayers, masons, and some other tradesmen may, perhaps, receive higher wages than machinists, but they have work only a portion of the year, while good machinists can find plenty of steady work, be it summer or winter, wet or dry, hot or cold. The machinists' trade is one not likely to become overcrowded. In fact, the demand for more machinists has become chronic, and any young man of mechanical tastes cannot do better than learn that trade in a thorough manner.—*American Machinist.*

RUBBER PLATES AND RINGS.—When rubber plates and rings are used for making connections between steam and other pipes, leaking of joints may be prevented by using a cement prepared by dissolving shellac in ammonia. The pulverized gum-shellac is soaked in ten times its weight of strong ammonia, when a slimy mass is obtained, which, in three or four weeks, will become liquid without the use of hot water. This fastens well both to the rubber and to the metal or wood, and becomes, by volatilization of the ammonia, hard and impermeable to either gases or fluids.

Phosphor-Bronze Hardware.

Using the term in its generic sense, as including a certain line of articles made of iron, steel, copper, brass or tin, perhaps there has been nothing of more importance to the hardware trade, recently, than the invention of the alloy known as phosphor-bronze. The name is sufficiently descriptive of this compound, the union of phosphorus with alloys of copper and tin being its distinguishing feature. By the peculiar chemical action of this ingredient the alloy combines the conditions of toughness, rigidity, hardness and great elastic resistance, which renders it of peculiar value. Although there are as yet but a very few companies in the world which manufacture it, its use is becoming more widely extended, and, in proportion as a degree of accuracy and uniformity in its composition is attained, its value is acknowledged. One of the features which is most likely to commend this alloy for the manufacture of many articles is its non-liability to corrode. Wire rope made of it proves very serviceable in mines, where it is exposed to acid water, and for the standing rigging and tiller ropes on vessels, where they are exposed to the action of salt water. For a similar reason nuts, screws and nails, for shingling, chemical and boat work, and bolts for ship fastenings, stay bolts of boilers, and for use in machinery and pumps, made of this alloy, give great satisfaction. The great electrical conductive power of phosphor-bronze wire, added to its lightness, rigidity against stretching from variations of temperature, and resistance to corrosion, are gaining for it a demand for electrical purposes. Chisels, hammers, swages, scissors, key wedges, etc., are all made of this article, in various sizes, and possessing fine temper and great hardness, and they are without any liability to give forth sparks when struck. In fact, this metal is susceptible of a great number of applications, and nearly all the articles of hardware that are made of iron or steel are now manufactured of this material also.—*Industrial World.*

Blacksmithing in Germany.

In the interior towns and villages of Germany it has been the custom for many years for the farmer to purchase the iron for the tires and horse-shoes, and in some instances, when having a new wagon built, to purchase all the iron entering into the same, the length of every piece being furnished him by the smith. One part of the contract is that the smith shall return to the farmer all ends and cuttings from the iron, and it frequently occurs that the farmer remains at the shop until the iron is all cut up, in order that the smith shall not indulge in too much cabbage. Each smith shop has what is termed "the hell," and in cutting off a set of tires, if the farmer is not present, the largest half of the end cut off finds its way to "the hell," the duty of putting it there devolving upon the youngest apprentice. From this plentiful store the smith furnishes his material for the manufacture of bolts, horse-shoes, etc., for transient customers. The horse-shoeing part is also a feature; the farmer will bring with him the end of some piece of iron or tire, with which to make the shoes, or perhaps a dozen or more old horse-shoes to be converted into new ones. The farmer must blow the bellows until the work is forged or the shoes all made, and must then hold up the horse's foot while the shoes are being driven on or taken off, and invariably carries the old shoes home with him, unless he prefers to give the old shoes in payment for the apprentice's service in holding up the feet.

STEAM BOILERS.—A singular dogma has lately been promulgated by somebody to the effect that a weak or poorly constructed boiler is safer at a high pressure in the charge of an intelligent engineer than a strong and well constructed one in the hands of a reckless and ignorant man at far less pressure. This statement has just the least tinge of superstition as regards the effect of intelligence on the strength of material, and should be accompanied by an explanation, which would probably amount to this: that the intelligent engineer having such a boiler in his charge would immediately stop it and take measures to render it safe, which, no doubt, the ignorant man would also do if told of his danger by the intelligent one. Two hundred pounds of intelligence is just as heavy on weak ice as the same avoirdupois of ignorance, but the wise man might perhaps crose safely where the fool would plunder into an air hole or stamp himself through.—*Scientific American.*

CAST IRON FOR STEAM BOILERS.—"I see," continued Mr. Sellers, "that some one has introduced an ordinance in Councils, forbidding the use of cast-iron boilers. I wish to rub in the fact that it is sheer nonsense. Cast-iron is just as good as any other iron in boilers. Some of the highest authorities say that it is better than any other kind. It all depends on how you use it. We have a cast-iron boiler that we use for testing injectors, because it will stand a higher pressure than a wrought-iron boiler. If you subject a cast-iron boiler-head to the same annealing process that a car wheel goes through, it will not explode. Take a car wheel out of the mold and lay it on wet sand, and it will crack. Let it cool off in the open air, and it will break easily; but put it in an oven and keep it red hot for two or three days and let it cool gradually, and it is almost unbreakable. The same is true of boiler heads."

SCIENTIFIC PROGRESS.

The Office of Resinous Matters in Plants.

It has been difficult to make even a plausible conjecture of the uses of the "proper juices" of plants. In their production a large amount of nutritive material is consumed; and for the most part they are stored up irretrievably in the plant, not being reconverted into nutritive material. This gave some color to the old idea that they are excrementitious. But, besides that under normal conditions they are not excreted, why should a pine tree convert such an amount of its assimilated ternary matters into turpentine, which is merely to be exuded? Or, if it be a by-product, what useful production or beneficial end attends the production? If excrementitious, the tree should be benefited by drawing it off. But, as De Vries remarks, and as the owners of the trees very well know, the process is injurious, and if followed up is destructive. It goes almost without saying nowadays, that the turpentine is of real good to the tree, else turpentine-bearing trees would not exist. De Vries has made out a real use, which he thinks is the true function of the resiniferous matters in *Coniferæ* and in other resin-producing plants. Resinous juice is stored in the tree as a balm for wounds. It is stored up under tension, so that it is immediately poured out over an abraded or wounded surface; for these wounds it makes the best of dressing, promptly oxidating, as it does, into a resinous coating, which excludes the air and wet and other injurious influences, especially the germs or spores which instigate decay; and so the process of healing, where there is true healing or reparation, or of healthy separation of the dead from the living tissues, is favored in the highest degree. The saturation of the woody layers with resin, in the vicinity of wounds and fractures (as is seen in the light wood of our hard pines) is referred to as effectively arresting the decay which parasitic fungi set up, this "fat" wood being impervious to mycelium.

Latex or milky juice is a more complex product, of which certain portions have been shown to be nutritive; but as to the caoutchouc and the waxy matters they contain, De Vries insists that they subserve a similar office, are, in fact, a remedy—a protection against decay, a natural provision for the dressing of wounds, under which healing may most favorably proceed.—*American Journal of Science.*

Is There Water on the Moon?

In a recent communication, Mr. Helmuth Dueberg, of Berlin, presents a new theory of the moon, and argues the possibility of its being inhabited on the further side.

It is well known that the moon always presents the same face to the earth. Because this side of the moon is an airless and waterless desert, we are not justified, Mr. Dueberg thinks, in assuming that the other side is like it.

Since the moon does not revolve so as to change the side presented to the earth, and since the attraction of the earth for the moon is very great, the heavier side, if there is any, must be turned this way. Supposing the moon to possess air and water, these lighter and more fluent elements of her composition would of necessity lie on the further side.

In absence of any centrifugal force due to rotation on her own axis, the only centrifugal force acting upon the moon must be that resulting from the moon's motion round the earth. This would tend still more to throw the moon's air and water to the "outside" with respect to the earth. For a practical illustration of this view, Mr. Dueberg suggests a ball swinging in a circle by means of a cord. The ball, like the moon, will always turn the same side to the center of revolution; and if it be dipped in any liquid, the liquid will be rapidly accumulated on the opposite or outer side. Hence the possibility of water, air, and life on the moon, around the shores of a central lunar sea, on the side always turned away from us.—*Scientific American.*

THE FLOW OF LIQUIDS IN PIPES.—At a recent meeting of the Physical Society of London, Mr. W. F. Stanley read a paper on the flow of liquids in pipes, and showed that liquids move by rolling contact upon the resistant surfaces of the pipe, and not by a sliding or shearing action, as has been generally assumed. The difficulty in carrying out his experiments lay in the fact that when a liquid flows through a pipe the friction of the pipe prevents the free motion of the rolling particles. For this reason with circular pipes the evidence of rolling contact is of a very complex character, and particles of solid matter, for example, descending in glass pipes take a spiral or zig-zag path very difficult to follow. Evidence of surface rotation was, however, found in the descent of a liquid cylinder or column of dense mastic varnish through a tall, narrow beaker from a glass funnel. The length of the descent was about 1.18 inches, and the width of the column 4 inches. It carried down with it small particles of solid matter and tiny air bubbles, which were seen to be in rapid rotation. Mr. Stanley illustrated his theory with a number of corroborative experiments with pipes of different forms.

Formation of Crystals.

Most of the metals assume, under certain conditions, a crystalline form, and those particularly which are found native occur frequently as crystals. Among the metals, bismuth is remarkable for its tendency to crystallize, and by following the directions given, a crystalline mass of bismuth is readily obtained. Take about a quarter of a pound of the commercial metal, and melt it either in a small, clean iron ladle or over a Bunsen lamp in a porcelain crucible; when quite melted, set the ladle or crucible on a cold metal surface. Let it remain perfectly still, and watch the bismuth carefully, until it is seen to solidify round the edges; then quickly pour out the metal still remaining liquid, and you have the whole of the interior lined with more or less perfect cubical crystals of bismuth. There is one striking peculiarity about these crystals, however. They are but skeleton crystals; the lines forming the edges of the cubes are there, but there is a depression in each face of the crystal evidently not as yet filled up. The growth of the crystal was arrested by pouring out the still liquid metal; and there we have not only shown us the shape of bismuth crystals, but also the manner in which the crystal grows.

For purposes of comparison, try now to make sulphur crystals. To do this, melt down roll sulphur in the ladle or crucible, using, however, a very gentle heat, and not prolonging it beyond the point at which the whole of the sulphur is melted; allow to cool in the same manner as with bismuth; wait until a crust has formed over the surface, and then immediately bore two holes through with a red-hot wire, the one for the liquid sulphur to run out, and the other to admit air. Pour out the sulphur still remaining liquid, and cut carefully round the upper crust with a penknife. Remove it, and the whole of the interior is interlaced with delicate needle-shaped, amber-like crystals of sulphur. Here, then, are two substances, of widely different appearance and properties, both possessing in common this property of crystallizing, but with each there is a definite shape. Further experiment and observation teach us that the form of a crystal is as characteristic of a body as any other property it possesses.

ACTION OF ELECTRIC CURRENTS ON CONES OF COAL.—At one of the recent meetings of the French Academy of Sciences, M. Jamin gave an account of a curious experiment which was made by him some time since. He explained the difference that exists in the production of electric light between the way in which the pile and the way in which the Rumkorff machine acts on the cones of coal, showing that with respect to the current of fluid the effect of the pile is quantitative, while the machine produces an enhanced intensity. M. Jamin states that the Gramme machine has something in common with both instruments, producing the same quantity of fluid as the former, and the same intensity as the latter. The method of conducting the experiment referred to is as follows: Both cones are placed in a vacuum and put in communication with the Gramme machine. As their heat increases a bluish glimmer passes around them a certain way down from the apex. Above this glimmer a broader band of stratified light makes its appearance. As the heating goes on, the cones assume a lively red-white hue; the balloon is filled with a violet glimmer that gets gradually more and more intense, reminding one of the coloring of iodine vapors. In reality, however, the coal in this case is turned into vapor, with which the balloon is filled. As this vapor returns to its solid state, the coal is precipitated in a thin stratum on the sides of the balloon, which thereby lose their transparency. The experiment is then at an end.

THE "binary absorption" system of ice-making has of late been attracting much attention. One of the latest discoveries is a new binary liquid composed of glycerine and ammonia, which has remarkably valuable properties. The discovery was made by Messrs. August J. Rossi and Leonard F. Beckwith. Experiments with the new liquid are going on at the works of the International Ice Machine Company at Greenpoint, N. Y. The pressure in the machine when in operation is said to be from 35 to 50 lbs., but at rest it is very slight, ranging from 0 to 15 lbs. per square inch. When we consider that the pressures in an ammonia ice machine may run up above 200 lbs. per square inch, one of the great advantages of the new liquid will be seen. We have no information in regard to the action of the vapor upon metals, or whether saturating the ammonia with glycerine has any effect upon the chemical quality of the vapor from the resulting liquid; if it has, a very great additional advantage has been obtained.

COMETS.—M. Prazmowski concludes, from observations since 1858 by the spectroscope and polariscope, that comets are formed of a condensed portion, which constitutes the nucleus, surrounded by an incandescent gaseous atmosphere, which contains carbon and reflects the solar light, and of a swarm of disaggregated material which is not controlled by the cometary attraction, but moves in obedience to universal attraction. In some comets the polarization of the light is strongly marked, while in others it is almost wholly absent. In the latter case he compares the structure to that of atmospheric clouds—*Comptes Rendus.*

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Horn Silver, July 4th, $15,000; Frisco, 4th, $6,300; Germania, 4th, $6,550; Hanauer, 4th, $9,670; Germania, 6th, $4,660; Horn Silver, 6th, $10,000; Bullionville, 6th, $1,591; Salt Lake City for week ending July 8th, $85,322; Ontario, week ending July 8th, $60,000; Horn Silver, July 8th; $19,500; Stormont, July 8th, $2,000.

We learn from the Dutch Flat *Times* that everything is favorable for rich drift diggings in John P. Hickey's mine, at that place. Quite an excitement was caused in the Flat when the news became current. The bed-rock in the mine, report says, is covered with gold.

The Mining Share Market.

There has been no special activity in stocks this week. The *Enterprise* reports that on the Comstock, at the north end, all continues to look very favorable. The Union Consolidated ore breasts on both the 2500 and 2600 levels continue to look well. There has really been but very little underground work done during the present week. There will not be the usual output of ore at the Union until the upraise now being mads from the 2700 level has connected with the ore stopes on the 2600 level. This connection will give a good circulation of air, and afford facilities for the extraction of ore below the 2600 level.

At the Mexican not much work has been done in the bottom of No. 1 winze. What has been done, however, shows the good milling ore to continne and to be gradually going east across the hottom of the winze. Eventually the winze will serve as a crosscut hy passiog through the ore doposit, hut afterwards a crosscut to the east may show it larger than at any point ahove.

The station and cooling house for the joint Ophir and Mexican winze on the 2900 level are completed, and the winze has been started. They will undouhtedly he ahle to sink this winzs to ths 3000 level without any trouhle, and may find no water to interfere till the 3100 level, or even a greater depth, is attained, as the sinking is heing done in a dry section—hetween two water helts, one lying to the north and the other to the southward.

At the Best & Belcher and Gould & Curry there is nothing new, and as the work heing done is the cutting out of a station at the 2500 level, it is not likely that any development will be made for some time to come. What caused the spurt in Best & Belcher is, therefore, one of those things that may he laid to the charge of the inscrutahle ways of the stock manipulator.

At the middle mines nothing in the way of active work is at present heing done. A fresh start will he taken as soon as the vein is connected with the Chollar-Norcross-Savage shaft on the 2600 levsl.

It is thought that something will now shortly he done toward pumping out the Jacket and other flooded mines.

It is reported that people are leaving the Wood River country hy the hundreds, men on foot meeting the stage and advising the passengers to get off and go hack, as they will have just that much less distance to walk. Most of those leaving are, no douht, men who never should have gone, not having means enough to prospect with, and expecting employment in a country too new to offer very much for the present. There is not much douht that Wood River is a pretty good country to prospect in, hut men must have means of suhsistence to do that.

Arizona.—A correspondent of the *Citizen* says that as A. Caldwell, superintendent of the Gunsight mine, and W. P. Boyer were on the road from Gila Bsnd to the mine, and about 11 miles from Gila Bend, they found the hody of Martin Crook, who had died of thirst. His hody was hrought to Gila Bsnd. Crook had started to walk to the Gunsight mine, 65 miles. There is only ons watering place on the road at the Ajo Copper. The mines are 48 miles from Gila Bsnd.

Cochise District.

Russelville Camp.

From the Tombstone *Republican* we take the following:

Rnsselville is the mining camp of Cochise district, which district is located in the extreme northern end of the Drsgoon mountains, reaching as far north as Summit station, on the Southern Pacific Railroad. Russelville is five miles south of the station, where the smelter of the Russelville G. & S. M. Co. is located. The mines are about two miles southwesterly from the smelter, in some low rolling hills.

Developments are confined principally to the Peahody lode, which shows large hodies of high grade argentiferous and auriferous copper ores. An incline has heen snnk to a depth of 100 ft. on the dip of the ledge. At 58 ft. a level was run about 45 ft. westward along the ledge and a crosscut thence at right angles southerly to a shaft 60 ft. distant. From this level hetween the incline and the elhow, stoping upwards in good ore is progressing. At 65 ft. down the incline, another drift has heen run to the eastward along the ledge where stoping in high-grade ore is heing done. The ore in this stope consists of sand carhonates and gray copper. Again at 90 ft. down another drift has heen run to the eastward ahout 70 ft., all the way in good ore. Here stoping is also heing prosecuted. The same level has heen continued along the ledge to the westward, where the stopes have heen carried upwards 20 ft., all in good ore. The stoping at this point has hsen confined to the hanging wall, and indications point to a large deposit on the foot-wall. The hottom of the incline is in as good ore as at the points ahove designated. Fourteen men in the stopes seud to the surface 20 tons of rich ore per day.

The smelter is a 30-ton water jacket and turns out about 10,000 pounds of copper hars per day. The ore not carrying its own flux, like Copper Qaeen, necessitates the addition of a large actual amount of iron and silica, which reduces the amount of ore run through per day to ahout 20 tons. This would indicate that the ore yields 20 per cent. copper, which assays 90 per cent., with the addition of $80 gold and $100 silver per ton of ingots. At the present time the smelter is shut down, owing to a lack of water. The water supply is from a well which, owiug to quicksand, did not penetrate sufficiently deep into the water-hearing strata to withstand the long dry season of this country. Mr. T. R. Sorin, from whom the ahove facts were learned, considers the future of the Peahody as very hright. One featnre in favor of these mines is the large amount of gold and silver the ore carries, therehy enriching the product hy $180 per ton, which, after deductiug all expenses of mining, smelting, rehining and transportation, will leave the copper and $100 of the precious metals as clean profit.

Challis occupies the important position of heing the key to all the mines in the Salmon River country for a distance along that stream of nearly 100 miles, including the Yankee Fork country. In the winter the climate is pleasant, while the mineral districts near are covered up in snow. Snow seldom falls to any great depth here. This induces mining men to winter, and many hring their families to make this their home, while they delve far ahove in the hills for the precious metals. The few hundred people here live happy, seem to prosper and grow rich.

The Mayor of Jacksonville, Fla., has vetoed the ordinance closing business houses on Sunday, becauss saloons wers not includsd.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

The DeWitt Claim.—Amador *Dispatch*, July 7: In company with Dr. G. J. Brown, we visited the mining claim of Mr. I. N. DeWitt, on Murphy's ridge, a few days ago, and found that gentleman hard at work digging up the gold-bearing earth or rather rock. At present, owing to the scarcity of water, he is simply working in "pockets" near the surface, which is paying him quite handsomely. While there, which was but a few hours, he took out several large tin buckets of decomposed quartz which showed liberally of the precious metal, and it was estimated that each bucket would yield from $20 to $30, upon which basis he could reap the neat little sum of $40 or $50 per day for two men's work. While these rich seams are not in large bulk, yet they are pretty thickly scattered over the claim, and indicate that if followed to a sufficient depth they will all come together and constitute a large, permanent and rich ledge. But even though this theory be wrong, Mr. DeWitt has a claim from which he can almost any day go into with pick, shovel and mortar and take out enough gold to use as pocket change when he comes to town.

CALAVERAS.

Bald Hill.—*Mountain Echo*, July 8: The Bald hill quartz claim, generally known as the Brunner mine, is situated two miles south of Angels, near Albany flat. The Matson Bros. have been working it for some time with arastras, and have all the time real-zed good wages. The vein, so far as developed, is about 20 ft wide, and the ore is of the same character as the Gold Cliff, of which it is supposed to be a continuation. The usual yield of this immense lead, is from $4 to $8 per ton, at a depth of only 20 ft. With proper facilities for working this mine, it would yield a handsome income.....Love & Findley crushed 12 tons of ore from the Dr. Hill mine recently, from which they realized $309.

Chispa.—We were shown a chispa the other day, valued at $2.50, taken from the Democrat mine, now being worked by James Matson.....Our mining interests are becoming more and more important as new developments are made. Mining experts and capitalists are turning their attention to our section of country, and as a general thing are highly pleased with the outlook. The recent immensely rich vein of silver ore developed in the Jones mine has created intense excitement in mining circles. We have not the full particulars in regard to operations in the mine this week, but we will give full particulars in our next.

EL DORADO.

Sixteen Ounces Per Day.—*Mountain Democrat*, July 8: From a quartz ledge not 10 miles from Placerville, during four days of last week, 64 ounces of gold, valued at $1,100, was crushed out in an ordinary prospecting hand-mortar. The ledge is a large and strong one, and shows a large quantity of ore quite as rich as that already taken out and crushed. We are not permitted to give further particulars, but will venture to say that there are no men in the country whom we would be better pleased to see make a strike than the lucky owners of this ledge; excepting, of course, the writer of these lines and his progeny.

Garden Valley and Kelsey Districts.—Georgetown *Gazette*, July 7: The first mine we visited was the Esperanza, owned by N. D. Burlingham. The ledge is about 25 ft in width where cut by tunnel, while the 20-ft shaft on surface shows only a 3 ft ledge of ribbon rock prospecting fully $5 per ton; hanging-wall hard and smooth as glass; ledge dipping on an angle of 50°. But in this wide surface shaft the nature of the feeders and general formation plainly indicate a monster lode. With pan and mortar we made several tests from the ledge in the tunnel, none of which showed less than a $5 prospect and some as high as $8 and $10. The rock runs very evenly. The owner claims the rock will average at least $8, take it from wall to wall. We then visited the old St. Lawreuce mine, the entire works of which were destroyed hy fire last season. The shaft reaches a depth of 900 ft on the incline. Has yielded upward of $1,000,000, and is still considered a valuable mine. Is owned by Mierson & Jowell, of Placerville The Lone Jack mine is a seam mine owned hy Jensen & Son, who have recently added to the mine a neat 2-stamp mill, to crush the pay rock they meet with while sluicing. The owners work along quietly and contentedly, and no one knows what they are taking out. They are working a system of seams and decomposed material lying along the west side of a quartz lode. The Old Judge mine, although only partially developed, has yielded several thousand dollars in specimen ore in years gone by. The ledge is about 6 ft wide, well defined, looks well and shows some sulphurets. A 50-ft shaft has been sunk, and a Huntington battery and donkey-engine placed upon the mine. The Rising Sun mine, owned hy Potter & Carothers, is considered a very good property. The ledge averages 4 ft in width, with good walls, and all the ore taken from a drift run in nearly 100 ft on the ledge has been crushed in Potter's stamp mill near by with an average yield of $7 per ton. South of the St. Lawrence and a mile northwest of the Rising Sun, is Burton's mine, from which a large run was made at Potter's mill, sometime last year, giving a return of $10 or $12 per ton. Mr. Burton has a ranch and family, and does all his own work, only taking out quartz when other work does not crowd him. The tunnel is near his house. There are a number of specimen or pocket claims on Coe hill, which is said to be an extension of the Greenwood seam belt, and some five miles from Greenwood. Most of the surface of this hill prospects well with the pan, but it is above the ditches and many good mines undoubtedly are lying idle and hidden for want of water advantages, like Spanish flat hill and other high points. One of the mines on Coe hill is the Amherst, from which Armstrong, Lee & Clark took out a fine lot of specimen ore over a year since. The mine lay idle for a time, but is now being energetically worked by Wm. G. Lee, Thomas Johnson and James Little. They are meeting with flattering prospects. Another mine on this hill being worked is the Vernon mine, owned by Decker & Ca others, which has heen paying them very well. Near by is the old Mansfield mine, once an incorporated property, now owned hy Mr. Burlingham. We learn from Mr. Burlingham that there is a move being made by its San Francisco owners to start up the old Gold Deposit. Some of the good mines we failed to see on our hurried trip was Wm. Davey's, Bell's and others, which we hope to examine at another time.

INYO.

The Hawley Mill.—Inyo *Independent*, July 7: The mill at Keeler City will be started by Supt. Wheeler on Monday next. There are some 300 tons of gold ore from the Palma mine on hand, with a sufficient supply of wood to run it through. Mr. W. S. Woodhull, foreman in charge of the mill, will be assisted for a time by his brother, Mr. S. D. Woodhull.

At Work.—Mr. Chalfant has been for the past three weeks, quite steadily running the old Brown Monstor mill, and some two weeks' more time will be required to complete the work contemplated in the original undertaking. He intends working all the ore on hand, the concentratious and, perhaps, a lot of tailings. He may put some needed repairs upon the mill—on the wheel, batteries and pans—hut that depends upon whether the owners of neighboring mines offer sufficient custom ore for working to justify it.

The Keynot.—Supt. McEvoy shut down the Keynot mill, at Beveridge, on the 30th ultimo, after a crushing of 61 tons of ore sorted from the waste dumps at the mine. About $2,500 in gold was the result. The mill will be started up again on the 15th, on ore from the Keynot, and will probably work a lot from the Lapwing mine.

STARTED UP.—The reconstructed Pioneer mill started up on the 2d instant on a lot of tailings from the old Kearsarge, which will keep it in operation all the season. Everything works satisfactorily, and the indications so far are that the result will be very good.

MONO.

BODIE.—*Free Press*, July 4: The Noonday and North Noonday joint incline reached water on Friday night last, at a depth of 314 ft below the 512 level, or 39 ft below the first incline level. The water will be lowered as fast as the Red Cloud shaft is sunk, which is compelled to drain a large extent of country as it goes down. An upraise has been started from the 275 incline level, to connect with the winze. Both upraise and winze are understood to be in the rich ore. The Bodie mill was last week running on unusually good ore, averaging over $115 per ton. The shipment was $11,917.28. The Lent shaft is down 960 ft. The east crosscut, 1200 level, of the Standard, is making good progress, and is now in 30 ft. The mills are running steadily, and in the prospecting mines there is the usual activity.

NEVADA.

STARTED UP.—*Tidings*, July 5: The East Eureka has started up in earnest. The mill, lately repaired by competent mechanics, is now in first-class order, and is seen running. Two stamps of the mill are running on tributers' rock, and the plates indicate that a good clean-up will be made. Mr. W. A Hawley, late of the Idaho mine, has charge of the mill at the East Eureka, and he is a most competent man for the position. The shaft at the mine is nearly all repaired down to the first level. After the shaft has been thoroughly repaired the old levels will be extended and the shaft sunk for the opening of another level. The boulders of this mine are very confident of success and will push operations ahead as fast as money and good management can do so..... The Grey Hound company have again found their ledge, and it is in good ground. The ledge is two ft thick and pieces of rock taken from it show free gold. There is considerable lead in the rock..... The old Empire is still holding out and, if anything, looks better than it has looked for some years past. New ground will soon be opened up at the Empire..... The New York Hill Co. has recently declared its 17th dividend. The dividend, payable immediately, amounts to 10 cents per share on the capital stock, and makes an average of $3.30 per share paid altogether upon 50,000 shares. Drifting is being done in the north and south drifts of the 13 level, the ledge being large but of low-grade ore. Tributers, working in what is known as Prouse's chute, in the 10 level, recently crushed 50 loads of ore which yielded $100 to the load, and tributers working in the Snydar chute, which is between the 8 and 10 levels, had a crushing of 20 loads which yielded them $65 per load. There are any emount of backs in the mine that have never as yet been touched. The outlook for the New York Hill is very favorable, and the Directors feel considerably encouraged. When the late dividend is paid it will leave a balance in the treasury of $10,339 40. Following is the total yield and expenses for the month of June: Total yield, $8,126 72; expenses, $7,339 78..... The Imperial company is still sinking, the shaft being 112 ft deep to-day. They will not cut the ledge again until water is reached..... The Idaho company are sinking the shaft for the 14 level, at the rate of about 7 ft a week. The ledge in the 13 level shows gold, while the 12 level ledge is, at present, considerably broken up. The shaft now going down is in good ground. The company will declare their 157th dividend on Monday next..... An extension of 1,500 ft. west, has been located on the Greeley-Blackman mine, by W. C. Lewis, of Sacramento. This will make two locations adjoining the Greeley-Blackman, and they will all three be incorporated into one claim, to be known as the Greeley-Blackman. Frank Hooper, of this place, has been appointed superintendent. Work will be commenced on this mine sometime during the present month..... The rock in the face of the tunnel of the Howard Hill mine has greatly improved of late, and it keeps getting better as the tunnel penetrates the hill. A crushing will soon be taken out..... The Washington mine has ceased work, temporarily in the south drift, and entire attention is now given to developing the ledge in the north drift, which is being run by contract. The machinery is being constantly run and the water is easily handled.

MARYLAND MINE.—Grass Valley *Union*, July 4: The sinking of the shaft on the Maryland mine is making steady progress, although some trouble has been experienced from surface water, but this drawback is being easily rectified. Stringers of fine-looking quartz-bearing, heavy sulphurets are encountered in sinking the shaft, giving promise that a good gold-beering ledge will be struck at no great depth. The Maryland is the eastern extension of the Idaho lode, and the quartz and sulphurets coming out are identical with those taken from the latter mine.

PLACER.

A BIG CLEAN-UP.—Placer *Herald*, July 8: The Morning Star drift claim, at Iowa Hill, recently cleaned up, and the result was equal to 35 ounces to the man for 4 weeks. The gold was heavy and coarse, some of the pieces weighing over an ounce. The channel in the claim is 400 ft wide. This bide fair to become one of the leading mines of the county.

SIERRA.

RUBY MINE.—*Tribune*, July 8: Very encouraging developments have been made at the Ruby mine during the past week. From Superintendent Jennings, who came over from the mine Monday, we learn that pay gravel has been in sight for several days, and very flattering results have been obtained from the dirt washed. Mr. Jeunings further says that beyond a doubt the main channel has been reached. The Ruby company has spent $175,000 in purchasing and developing the property, but the prospecte now are that they will soon be recompensed for the expenditure.

TRINITY.

PAYING BIG.—Trinity *Journal*, July 8: Messrs. Hickey & Baker continue to work their quartz ledge on Eastman gulch, above Lewiston, making plenty of money and saying little about it. They have just concluded a month's run with the arastra, taking out between $4,000 and $5,000. They crush about a ton in 24 hours, and it averages $150 per ton, while the total expense of getting it out and working it does not exceea $10 per ton. Trinity county to-day has more and richer quartz than any other section of California.

NEVADA.

WASHOE DISTRICT.

CON. VIRGINIA.—*Enterprise*, June 6: Are engaged in making general repairs.

UTAH.—Are remembering and repairing the top of the incline. The east drift on the 2500 level has been advanced 18 ft.

OPHIR.—On the 2000 level the main south lateral drift is being timbered up and repairs are being made. Have commenced sinking the joint Mexican winze. Are extracting ore from the croppings.

MEXICAN.—On the 2700 level west crosscut No. 2 has been advanced 12 ft and winze No. 1 sunk 6 ft, the bottom showing some fair milling ore.

SIERRA NEVADA.—On the 2500 level are putting a donkey-pump and column into No. 2 winze.

UNION CON.—On the 2300 level the south drift has been advanced 16 ft, and the joint Sierra Nevada crosscut 15 ft. During the week 213 tons of ore have been extracted, and 545 tone and 60 lbs sent to the mill.

YELLOW JACKET.—The water in the mine has been stationary since the last weekly report. It is, no doubt, filling some openings, as the flow of surface water is fully 10 inches At the Winters' shaft work progresses as usual. On the Sagebrush level are opening a drift west from the north lateral, 165 ft from the south line; the quartz in same gives low assays. On the 34 level we have commenced on work south in the old stopee, where the filling will pay to take out.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, July 7: Connection was made on Saturday last between the 4th and 5th shaft levels by means of a small drift, which has been run from the bottom of the 4th level winze to meet the main drift of the 5th. It will take 3 or 4 days to enlarge this drift; after this facilities for exploring this portion of the mine will be increased and accomplished by means of drifting and crosscutting. The intermediate, between the 2d and 3d levels, has improved materially, the ore having widened to 3½ ft, and gives an average assay value of $70 per ton. There has been very little change in the other shaft levels. The levels above the adit show well throughout, and the outlook is quite promising. Very little work has been done on the 8th level during the week, the greater portion of the ore extracted being from the upraise, now 30 ft above this level and all the way in ore, showing an average width of 3½ ft, and assaying $100 per ton. There is still further improvement on the 9th level, the ore being of very fine grade, and in places from 8 to 10 ft wide. A new steam pump has been put in position for raising the water from the tank beside the railroad track to the one above the hoisting works, a distance of 45 ft This is quite an improvement, for by the use of the very little steam used in running the pump only an hour each day—all the water needed for the 24 hours can be pumped up. The total shipments of bullion on June account amounted to $81,417 05, and there has been $5,510.29 shipped on July account to the 6th instant.

DOWNEYVILLE DISTRICT.

SILVER CAVE. Cor. Grantsville *Bonanza*, July 7: Downeyville is booming just now with excitement. Our wonderful "Silver Chamber" is open for every one to see, and it is a sight, once seen, never to be forgotten, and it is a guarantee of the future prosperity of this place. Men of large experience in mining matters, who have come here to see if the half of the truth has been told, say that the reports given have not been exaggerated, that Downeyville has reached a permanency, and that it is only a question of time when this becomes one of the foremost camps in the State. Not a question of money, for there is money enough in sight. Work is going on vigorously. The furnace ran steadily for a week, and in that time a thousand bars of bullion were run out. Some repairs had then to be made, but it will start again this week. In the meantime grading is going on for the new furnace, and preparations are being made to sink the main shaft deeper and run lower levels.

ELLSWORTH DISTRICT.

HOISTING ORE.—Cor. Grantsville *Bonanza*, July 7: The Esta Buena company are hoisting ore preparatory to supplying the mill now near completion under the supervision of Mr. Ogden. All in all, Ellsworth, after a decay of about 10 years, really appears on the verge of a prosperous future. But Marble Falls takes the palm in old as well as new prospects. A new discovery near the Marble Falls mines has been made by W. F. McPherson (and is now being prospected by the owners, McPherson & Howe) which is beginning to loom up in pretentions worthy of a paying mine. Fifteen tons of ore have been taken out in as many days of a high-grade—ore that averages $250 per ton as sampled from the sacks. One shipment of ore has been made from the mine to Luning, and the proprietors are only waiting the way of transportation to ship more. The mine is down 25 ft and shows 5 ft of high-grade ore.

ESMERALDA DISTRICT.

CORTEZ.—Esmerald *Herald*, July 8: On Thursday afternoon a representative of the *Herald* went through the Cortez mine. In passing through the various workings, we avail ourselves of the knowledge of our conductor, Eugene Godat, who has been in the mine as a miner from the commencement of work by the Cortez management. We were agreeably surprised to find such large bodies of ore. We were shown at various points in drifts, stopes and shafts where men were at work, or where they had recently been taking out ore, fine showing of pay rock, and, in some places, very rich decomposed ore. The active superintendent is closely watching the ore taken from the different parts of the mine and the old dump, and is making assaye right along to ascertain its value at all points in the mine. The Humboldt Hill Co.'s mill finished crushing a lot of about 95 tone of this ore last night, and is now making a clean-up. From the assays and tests made during the working of the ore, the result bids fair to excel the expectation of the company at the beginning.

THE LEWIS CON. is constantly improving as work progresses, and now shows a fine body of rich ore. About 5 tone of first-class ore, taken out in developing the mine, will be run through the mill as a sort of test.

AT THE Humboldt West a drift has been run north from the bottom of the south shaft, which is 100 ft deep, to a point directly under the north sbaft, and the ledge is now being crosscut at the latter point, and shows some very good ore.. McKinlay & Winters have about 10 tons of ore at the mill, which was taken from Middle Hill some time ago, that will be crushed.

LEWIS DISTRICT.

BETTY O'NEAL.—Lewis *Herald*, July 8: The shaft in the Betty O'Neal mine has been sunk 76 ft to the 1st of July, making a total depth of 227 ft. The last 7 ft has been in a clay seam, and underlying this strata quartz has been struck which carries considerable mineral, and, from present indications, the ledge has been encountered, but the width or richness cannot be estimated at present. The flow of water has increased considerably, and has now attained a volume that keeps the pumps running to their full capacity. It is thought that the flow of water will decrease in about a week or 10 days. The winze is down 64 ft, in good ore all the way. The ledge has increased in size and is as rich as heretofore. Quite a pile of first-class ore is on the dump, though no stoping has been done.

MORNING STAR.—Work will be resumed on the Morning Star shortly. Bids for running a level have been called for. The grade to the mine is being pushed ahead, and a good wagon road to the mine will be the result.

EAGLE.—The tributers are still taking out ore from the Eagle mine and making good wages.

WILLOW CREEK DISTRICT.

THE MINES.—Cor. *Silver State*, July 7: The Iowa mine, owned by A. H. Ruse, is from 5 to 11 ft wide. A tunnel run by its owner, who is deserving of a rich reward for his energy and perseverance, is 175 ft, showing the ledge to be a true fissure vein, with walls as smooth as glass The ore contains silver and gold, and the mine is favorably situated for working purposes. Willow Creek is a perfect paradise at this season of the year. Gold and silver bearing ores, as well as deer and trout, abound there. The water is good and abundant, and the only reason why capital is not invested there is because those who own the mines do not talk enough about them. Talk brings capital, especially where there are such mines as the Ohio and Iowa to back it up. Capital employs labor, and labor spends money for necessaries. Consequently merchants should interest themselves in developing mines and helping prospectors with a sack of flour occasionally. The Ohio and Iowa mines will be a fortune to their owners when developed. A mill will be taken to the district shortly, and it is confidently expected that it will produce sufficient bullion to attract the attention of San Francisco capitalists.

ARIZONA.

OUR COPPER INTERESTS.—*Silver Belt*, July 4: Of Globe's three principal copper mines the Globe has commenced operations, turning out at the rate of 9½ tons of copper every 24 hours, or a total of 570,000 lbs per month. The Buffalo follows next; the furnaces are in full blast and the copper bullion runs out at a satisfactory rate. The Hoosier smelter has been ordered, the site for which is being graded, and reduction work on the 30 ft of good grade copper ore will become a fact within the next 70 days. The ore in sight in the Globe, that by actual measurement in the Buffalo, and the 30 ft of Hoosier ore will not be less than 100,000 tons, giving a net product of 15% assay value of a total of 15,000 tons of ingot copper, the value of which, at 20 cents, the Eastern contract price, would be $6,000,000. These figures, although large, are not the fancy of our imagination, but are the result of careful measurement and computation by men of experience, not of Globe, but persons who were here in the interest of Eastern refiners and workers in copper. What the Globa is now producing with one furnace equals very nearly the product of the Copper Queen, of Bisbee, which operates with two smelters of 30 tons capacity each, and produces 11 tons of copper ore avery 24 hours. When we consider that this last-named mine employs, in different capacities, over 250 men, we can safely assume that our smelters here will employ fully 500. It surely does not require very great penetration of mind to estimate the benefit which this immense production of copper will have upon the growth and welfare of Globe itself.

LONE STAR DISTRICT.—Tombstone *Republican*, July 8: From Mr. Byron Scoville, who has just returned from beyond the Gila, the following facts have been learned about the mines in the Lone Star district. This district is 10 miles from Safford, the county seat of Graham, and about the same distance north of the Gila river. The original discovery of these mines was made by J. P. Lindsey and others in the summer of 1878, but, owing to Indian troubles in the near vicinity, have not been worked to any extent. While there are many copper ledges in the district the majority of them are distinctively gold and silver. The mineral belt is about 5 miles square, within the boudaries of which over 100 locations have been made. The mine upon which the most work has been done is the Lone Star, which is now under bond to Tucson parties. This has been sunk upon to a depth of 45 ft, and has a vein of solid sulphide ore 2½ ft thick, the assaya from which run over 40 The most remarkable one, however, is called Horseshoe, from the configuration of the outcroppings to that article. It is 480 ft around the shoe and 50 ft across the ends thereof. The croppings are continuous and 4 ft thick. A pit has been sunk 4 ft deep on the ledge, from which not less than 2 tons of ore were taken that give an average assay of 48 copper. The country rock inside this cropping is an iron-stained porphyry that looks as though it might give way to a mass of ore beneath. Bellya & Connor are sinking upon one of their lodes, and were down 10 ft when Mr. Scoville was there. They have between 3 and 4 ft of solid ore of very high grade. There were many other promising ledges which we have neither time nor space to mention. Mr. Scoville, whose opinion upon mining matters is conservative and sound, considers the prospects for this camp very good indeed, other reports to the contrary notwithstanding.

GRAND CENTRAL.—Tombstone *Epitaph*, July 8: Nothing of extraordinary importance has occurred at this mine since our last report. The crosscut being run west from the new shaft is in 230 ft. The drifts in the 400, 500 and 600 levels are making good progress and looking well. The stopes throughout the mine are looking and producing about the same. Shipping 90 tons of ore daily. The bullion product will not be as great as last month, in consequence of some second-class ore being shipped in order to remove it out of the way.

EMPIRE.—Work is being pushed with rapidity on the north drifts of the 400 and 450 levels, and both are looking very favorable. The stope in the 450 level is improving in appearance, and the ore body increasing in size. A drift has been started south from the 450 level, in low grade at present, with occasional very rich pockets. The usual quantity of ore is hoisted. A winze has been started on the 400 level. The mine is looking better than ever before.

HEAD CENTER.—A full force of men were put to work on the Head Center mines our last report, and 30 tons of ore are now being shipped to the mill daily. The mill started up on the 1st, and is now smashing rock as fast as circumstances will permit. A new giraffe has been put in at the mine, and is working in good style.

TRANQUILITY.—This mine started up on Wednesday, with a force of 14 men. Drifts have been started both ways from the first level, and some nice ore is extracted. Will start work on a more extended scale in a few days. The mine is looking well, and big things are anticipated when work gets on full beadway.

THE CONTENTION.—Things are going on at this mine almost as usual. Sinking has been discontinued, and the usual amount of ore is being shipped. The mine looks more favorable than ever before.

INGERSOLL.—About 60 tons of ore were hoisted from the Ingersoll during the past week. The upraise shaft from the 80 level is progressing rapidly. The west ore body is developing better daily, and promises when fully opened up to become a vast deposit. A drift has been started west from the 120 level, to cut the ore body. The indications so far are good, and it is expected that the ore body will be tapped in a few days. Progress is reported in the other works heretofore described.

THE FRANKLIN.—A force of miners are still driving the crosscuts in the Franklin. Several strata of rich ore were cut, but none of them very extensive.

COLORADO.

WILLIAMS' FORK MINES.—Colorado *Miner*: From Thos. Webb, who arrived from Williams Fork last Wednesday evening, we obtained the following information of mining matters in that camp: The Bob Tail has been drifted upon about 50 ft, and shows from 3 to 4 inches of ore that will run 200 ounces silver per ton. Mr. Webb brought over 35 sacks of ore, of which the first-class ran 251 ounces, and the second-class 143 ounces silver per ton. Specimens of this ore, which are now upon our table, are composed of gray copper, ruby silver, fine-grained galena and silver glance, which will run 10,000 ounces. Bob Tail No. 2 has been developed by a shaft 10 ft deep, which has produced some exceedingly fine ore, and is owned by the same parties. Little Lillie, owned by the same parties, has a 10-ft shaft, which has produced ore that ran 210 ounces silver to the ton. Silver Moon, Sampson, Longfellow and Spit Fire, owned by Moore & Marsh, are excellent prospects. A tunnel is being driven to intersect the properties, which will be done during the coming season. The ore from these properties has milled upwards of 200 ounces silver per ton. Mitchell & Co. own the Echo and Homestretch. One-quarter of the latter lode has been purchased for $4,000 by some Eastern parties during the past week. Wilson & Co. own the Ready Cash and other lodes, from which they have obtained mill-runs of 278 ounces silver per ton.

DAILY DISTRICT.—Georgetown *Courier*, July 4: Sol Robeson returned from Daily district last Saturday, and reports a strike of rich ore in the Mountain Ram lode, which was made last week. The vein is small, but carries a large amount of native gold and silver. The mine has been placed in condition for work, and it is Mr. Robeson's intention to work it steadily this season. E E. Wentworth has commenced work on the Garfield lode, which is showing up finely. He has an 8-inch vein of quartz, impregnated with silver glance, which assays in the neighborhood of 1200 ounces, and, it is estimated, will mill about 400 ounces. Work has also been commenced on the Adelbert lode, owned by Cowles & Robeson, and within the next fortnight work will be started on several other properties, as many miners and prospectors are making arrangements to go in at once, the snow having almost wholly disappeared.

IDAHO.

SAWTOOTH NEWS.—Cor. Wood River *Times*, July 4: Many of the prospectors are opening up their claims, expecting to have their ore milled. This alone would build up the country, and if prospectors would only stop and consider what small, almost starving, wages they make by having prospects and leaving them undeveloped for a chance sale, they would put in more work, I imagine, and oftttimes make more money than by selling. There is employment in and around Sawtooth for at least 200 men. Many of the mines, partially developed, are giving work to from 6 to 10 men. The Columbia and Beaver mining company have over 70 on their pay-roll, building roads, hauling brick, logging for the saw-mill, hauling ore from the mines, and chopping cord-wood for the mill, which they expect to start up about the 1st of August. They are at present taking out some very fine ore from the Columbia mine, assaying about $800 per ton. They struck it late last fall, sinking in the winze, where it assayed $500, but too late in the season to develop very far, as the snow was very deep around the mine and the winze filled in with water. They continued sinking, and have obtained a depth of about 25 ft of still richer ore, with indications that it will hold out for some time. In the other mines, excepting the Pilgrim and those managed by Colonel Brodhead, work has just commenced for the season. Mr. McManus is superintending 4 claims owned by a stock company recently organized in Ogden, and finds developments very satisfactory.

MONTANA.

LEASED. Butte *Miner*, June 5th; The Anaconda company has leased the Dexter mill for a year. Julian Smith is running the mill continuously on Anaconda free milling ore. Nobody knows exactly how much of this ore the Anaconda has, but the supply is said to be large. This being the case, it is probable no Anaconda smelter will be built until next summer, about the time the Dexter lease expires..... The magnificent new 40-stamp mill of the Lexington company is now almost finished, and will certainly be in operation in a little more than 60 days. The Stetefeldt furnaces have been set and are ready for use. The batteries are in place, and are ready for the insertion of the stamps. The engines have not yet arrived, but are expected shortly, and this great mill, undoubtedly one of the finest and most complete on the coast, will be soon making a handsome increase in Butte's bullion output. In the meantime the old mill continues to run on Lexington ore, with fine results..... In the Lexington mine the shaft has been sunk about 400 ft, but crosscutting from the fourth station has not yet been begun.

THE CABLE DISTRICT.—*Inter-Mountain*, July 4: Salton Cameron, who owns the Pyrenees mine and mill at Cable, arrived in the city last night on his regular weekly trip, bringing with him a $1,400 bar of gold bullion, the product of his 5 stamps. He is making preparations to increase his mill capacity to 15 stamps, feeling encouraged to go to that expense by the splendid appearance of the mine, which shows increasing ore reserves as development proceeds. The rock now being extracted assays from $18 to $25 per ton. The Cable mill is running smoothly on good ore, of which the mine is yielding an abundance. The last clean-up was the biggest ever made in the mill, but for some reason the superintendent refuses to make known any facts in regard to the company's operations. The building of the new 30-stamp mill has begun, and will be pushed to completion with all available energy. The machinery is being furnished by Fraser & Chalmers.

NEW MEXICO.

BURRO MOUNTAINS.—*News and Press*, July 1: Steady improvement is the order of the day in the Burro Mountains mining district Many properties hitherto neglected are developing into valuable mines, while the leading claims at Paschal, Seawall Springs and Oak Grove are showing splendidly, and turning out their usual quantity of ore, and a confident tone is heard among mining men, whose faith and judgment have been manifested by the amount of coin they have here invested.. The Valverda smelters keep up their unceasing rattle day and night, and their yield of copper is improving in quality and increasing in quantity daily. The Boston has commenced to ship ore to the Valverde smelters. This is one of the prominent veins of this district, upon which active preparations are being made for extensive work. The road has been completed to this mine, making it accessible in every way The shaft on the Silver mine, situated about 4 miles from Paschal, in a northwesterly direction, owned by Asa Kilburne and others, is now down nearly 60 ft, showing a very fine quality of rich chlorides and carbonates, with a ledge 2 ft wide, which promises to develop into an extensive ore body. The pay streak is a foot at the surface, and 2 ft at the bottom of the shaft. The ore at 5 ft assayed 10 to 12 ounces, at 25 ft 100 ounces, and is improving as the work is being prosecuted.

OREGON.

NOTES.—Jacksonville *Times*, July 7: Capt. Kelly's mines on Coyote creek are said to be paying well..... John Haviland, of Canyon creek, Josephine county, is about extending his ditch some distance..... Wimer & Sons, of Waldo, are about making preparations to clean up. They expect to make a very good run..... Ex-Governor Chadwick is in Josephine county in the interests of Portland capitalists who talk of investing in copper mines.. DeLamatter & Newman, who own the Cow flat mines, in Josephine county, have finished cleaning up, with very satisfactory results..... Goff & Triplett, of Grave creek, have been picking up some fine nuggets of quartz rich with gold. A few days ago they picked up one worth $250..... The Squaw Lake Ditch Co. will set their pipe on higher ground at once, when piping will be resumed. Big Applegate is said to be full of tailings where they have been dumping..... The miners of Grave creek and vicinity are genera ly in the midst of cleaning up, though some have finished. We are informed that several are well paid for the season's work..... The Steam Beer mine, on Grave creek, has paid very well during the past season under the management of Thos. Critser. We learn that there is some prospect of it being sold for a respectable sum..... The Sterling M. Co. is making preparations to clean up. The fount of supply has about been exhausted, but there is still a large quantity of water in a ditch It is beginning to fail, however. A very good result is anticipated..... Wm. Bybee informs us that the contract has been let for the extension of Bybee, Newman & Hawkett's ditch in Josephine county; and J. W. Bennett is engaged getting out several thousand ft of lumber for the company for fluming purposes. They expect that these improvements will enable them to take out thousands of dollars next season..... Mr. Derickson, lately of Idaho, expects to make arrangements to work several quartz ledges in this county for an interest in them, and will order a small mill from Portland soon. This may be the means of opening several good mines, and at the same time call proper attention to our mining interests, which seem to only lack development to make them valuable..... N. DeLamatter has purchased Peter Reiser's claim, some distance below Cow Flat, paying him $5,000 for it. This is one of the best pieces of mining property in Josephine county. We learn that Mr DeLamatter proposes extending the ditch from his other claims, so that a "little giant" can be operated on his last purchase. He is a gentleman of enterprise and pluck, and deserves success.

UTAH.

THE NORWAY IRON COMPANY.—Salt Lake *Tribune*, July 4: We learn that during the past few weeks the Norway Iron Co. have been engaged getting out ore for the iron works at Ogden, which works will, in a few days, make a test run. The property of the Norway Co. lies 10 miles due south from Weber station, on the Union Pacific, and is about 20 miles distant from that city. The ore is hauled to Weber, and then shipped to Ogden by rail. The company is under contract to furnish 150 tons of ore, and 60 tons of which has already been sent to the furnace, and the balance will go forward as fast as they can send it with the limited number of teams they have employed. They find it difficult to get as many teams as they wish. The Norway mine is located in Hardscrabble canyon, in what is known as Mill Creek mining district. Besides being an immense deposit of iron ore, it is of remarkably good quality, and the mine was given its name because it produced iron which is claimed to be equal in quality to the rod and bar iron which comes to this country from Norway. While taking out ore to supply this contract, the company are also making chutes to send it down the wagon road, opening up the mine in new places, and otherwise improving the property. The Ogden iron works propose mixing this ore with ores from Willard and other places near Ogden, in hopes of producing fine qualities of pig iron at little cost of reduction. Should the tests, to be made at Ogden within the next week or 10 days prove successful, it will do much toward the establishing of immense enterprises in iron manufactures in Utah, and open up a great industry here.

TINTIC.—Southern Utah *Times*, July 4: Tintic mining district is lively at present. The railroad has just reached there, making the valley easy of access.

On Rocks.

[Lecture delivered before the Mechanics Institute, by A. W. Jackson, Jr., Instructor in Mineralogy and Economic Geology at the University of California.]

The distinction between *mineral* and *rock* is not a familiar one in ordinary language, but is one of the very first importance when one begins to examine carefully the nature and relations of the inorganic materials of which the crust of the earth consists. I have already drawn your attention to this distinction in my previous lecture. Let me repeat it: The *mineral* is essentially homogeneous in composition, while the *rock* is heterogeneous. The mineral holds the same relation to the rock that a letter does to a word. Thus, quartz, mica, and feldspar are all minerals, while the combination of the three, indefinitely and mechanically mixed together, forms the rock—granite.

Minerals, as such, generally occur in small masses or granules, while rocks are the huge masses which make up our mountains and continents. It is true, however, that some few minerals, notably quartz, gypsum, and calcspar (in the form of limestone), also occur in widely extended masses, which, in some places, enter largely into the structure of mountains, and even continents.

These minerals are then called rocks, and are distinguished as *simple* rocks from those made up of mixtures of two or more minerals, which are called *composite* rocks. We shall speak this evening principally of the latter. The minerals which enter into the composition of a rock are called its constituents, and it is easy to distinguish between essential constituents, or those which make up the great bulk of the rock—are "essential" to it, in other words—and accessory constituents, or those which are found only here and there sparsely disseminated through it, and evidently of quite secondary importance.

Constituents.

If now you will examine for a moment the constituent granules of a piece of coarse sandstone and of a piece of granite, you will quickly arrive at the essential difference between two large classes of rocks. The sandstone you will find to consist of rounded granules of quartz, held together by a very fine-grained, perhaps argillaceous, cement. Evidently the quartz granules were not formed there. They must have been formed elsewhere, and transported by water (whence the rounded form) to the place where they were cemented into the sandstone, while the cement is made up of still finer particles of some other rock transported to the same place. In other words, the rock is made up entirely of fragments of pre-existing rocks. Such rocks (sandstone is but the type of a class) we call *fragmental* or *clastic*. An equally careful examination of granite will convince one that the sharp-cornered crystalline granules have not been transported, and the way they interlock proves that they were formed as such just where we see them. Such rocks (and, again, granite is but the type of a large class) we call *crystalline*. These two classes of rocks make up most of the earth crust with which we are acquainted. A third class, called *amorphous*, has a very restricted occurrence, but is of very great importance from a genetic standpoint. Obsidian is a type of the rocks of this class, all of which show the same glassy appearance as obsidian or as ordinary furnace slag.

Chemical Composition.

Let me next call your attention for a few moments to the mineralogical and chemical composition of rocks. Of the large number of minerals (over 600) known to science, it seems surprising that so few should occur as essential rock constituents. When I have mentioned quartz, feldspars, micas, hornblendes, augites, calcspar, gypsum, I have mentioned the minerals that make up, perhaps, ninety-seven hundredths of the solid earth crust. If I were to enlarge the list, I would add, perhaps, about 18 more that are locally important, but that stand, together, inferior to those just mentioned.

The chemical composition of the rocks is equally simple. Of course, in all of the rocks will be found all of the elements known to chemistry, but by far the greatest mass of the rocks is made up of only eight to ten elements.

The chemical composition of rocks varies as follows:

Silica	40%	82%
Alumina	5	30
Iron oxide	1	30
Lime	1	16
Magnesia	1	16
Potash	1	12
Soda	1	10

Silica stands at the head of the list, making up about one-half, by weight, of all rocks, excluding limestones. Or, again, oxygen, which enters into the composition of all of the above substances, makes up about one-half, by weight, of all rocks, while silicon, the other constituent of silica, makes up about one-fourth of the rocks. Silica occurs not only free as quartz, but also combined with the alkalies and alkaline earths in most of the rock-forming minerals.

Alumina comes next in importance, lime and magnesia next.

Potash and soda are notable more for their unfailing presence than for their large quantity, and the same may be said of iron oxide.

Carbon may be added to this list as an exceedingly important element in limestones, and these nine elements make up fully .97 to .98 of the earth's crust.

You perceive, thus, how exceedingly simple is the chemical apparatus used in the world-wide process of rock formation that has continued from the dawn of creation to the present day.

Rock Texture.

Of considerable interest in determining the nature of a rock is what is known as rock texture; *i. e.*, the manner in which the constituent granules of a rock are related to each other. This distinction is founded first upon the size of the granules, and secondly upon their relative positions.

With respect to size, we distinguish among the crystalline rocks, *macrocrystalline*, or those in which the crystalline grannles are easily distinguished, and *cryptocrystalline*, or those in which the constituent granules cannot be distinguished apart. Similarly, among the clastic rocks we distinguish *macroclastic* and *cryptoclastic*.

With respect to relative positions of the rock constituents, we distinguish, among the crystalline rocks, between *massive*, or those in which there is no parallelism between the micaceous constituents and *shistoid*, or those in which the micaceous or other scaly or tabular constituents are more or less parallel to one another. Among the clastic rocks, a similar distinction is made between the massive and laminated varieties of texture.

One other kind of texture peculiar to crystalline and amorphous rocks I will mention, viz: the porphyritic texture. This is developed in any rock by the enlargement of the crystals of one or more of the constituents, so that we have a rock consisting of larger crystals scattered in a matrix of finer-grained rock material. "Porphyry," then, one of the three or four names constituting the ordinary miner's rock vocabulary, is the name of a *texture* which may exist, or may not exist, in any one of the crystalline rocks, and not the name of a *rock* itself.

The Study of Rocks.

For reasons which you will not fail to appreciate, that branch of geology, which concerns itself more particularly with the nature and origin of rocks, has been altogether the slowest in reaching a satisfactory stage of development. The reason lay in the imperfect methods of study brought to bear upon the most fundamental problem presented, viz.: the mineralogical constitution of the different rocks. Evidently, when people are going to discuss anything, it is of the first importance that they should know what they are talking about, and, until comparatively recently, it was impossible to determine this with respect to the composition of rocks. Peculiar difficulties are presented not met with in the ordinary determinations of minerals. Ordinarily, we can easily determine the chemical composition, the crystal form, density and cleavage, properties which at once determine the true character of a mineral; but, when the mineral is in exceedingly fine grannles, and intimately mixed with three or four other minerals, every one of these properties is masked and defies recognition. With many rocks this difficulty is even worse. In the cryptocrystallins and cryptoclastic rocks, as I have said, the grannles are so minute as to be invisible to the unaided eye. The rock appears to be perfectly homogeneous—to consist of but a single mineral—and yet it may be made up of five or six. The color of the rock tells very little. It is generally either gray or black, and according as it is one or the other, the names "trachyte" or "trapp" are employed. But the minerals entering into the composition of two different "trachytes" or "trapps" may be entirely different, and yet, to the eye the rocks appear identical. Herein lies the secret of the almost universal ignorance concerning rocks.

How is it possible for the ordinary miner to have a more extensive rock vocabulary than I indicated a moment ago? He has no means of finding out the real nature of his rock. And it has not been the common miner only, but even those who have been most interested in the subject and most zealous in studying the composition of rocks that have been almost equally inexact in their determination of rocks, and for the same reason.

It is no wonder that during the growth of the science many wild theories have been engendered, and defended even by eminent geologists; but in this, as in every other branch of science, all theory should be based upon accurately observed facts; every separate mineral, every peculiarity of structure, every crystal form even, is the expression of some condition (we know not how important) that existed at the time of the formation of the rock in which they exist; and it is only when we know the minerals accurately, when we are familiar with every peculiarity of mineral structure and form, that we can reason backward to the conditions of which they are the expression.

Microscopic Examination.

It is right here that the microscope has come to our aid. Not only can we now study the intimate structure of the granitic rocks, but in extremely thin sections, the indefinitely small grannles which make up the cryptocrystalline rocks can be accurately investigated, and we are thus enabled to throw some light on the genesis of the rock.

Perhaps no better instance than this can be adduced of the reanimating effect upon any department of science of the introduction into it of a new method of investigation.

Further progress in this branch of geology seemed to be at an end.

Chemistry had grappled with the problems presented, had worked long and faithfully, but had finally been obliged to acknowledge herself unable to solve them. Then, after a space, came the microscope. Just as the telescope in the hands of Galileo first gave us a conception of the creations and processes of infinite *space*, and infused new life and spirit into astronomical research, so the microscope in the hands of Henry Clifton Sorby first gave us a true conception of the creations and processes of infinite *time*, and reanimated to a wonderful degree geological research in this direction.

Let me briefly sketch the process of preparing a rock for examination under the microscope. One first strikes off from a hand specimen, by means of a hammer, a thin chip of the rock, about an inch square. This is then held by the tips of the fingers and ground flat and smooth on one side by rubbing with coarse emery and water on a smooth iron plate, finishing the operation with finest flour of emery on a glass plate. The chip thus prepared on one side is then cemented with Canada balsam to a small square of thick plate glass, with the prepared side next to the glass. The glass square is then held by the fingers, and the rough side of the chip ground off, as before, with coarse emery on an iron plate, finishing, as before, with flour of emery. In this way an exceedingly thin section of the rock can be prepared which is perfectly transparent. The section is then easily transferred to a regular microscopic slide and covered with a thin glass cover. It is now ready for examination.

And now as to the revelations which the microscope has made: In the first place, it makes no difference how fine-grained the rock may be; it is perfectly possible to use magnifying powers up to a 1,000 or 1,200 diameters, and that is altogether sufficient to resolve into its constituents the most rocks with which the geologist has to deal.

It is true the microscope does not enable us to make a chemical analysis of each mineral (although even that has been accomplished by another process), but it does enable us to determine so many other properties that it is rarely the case that a mineral escapes determination.

It makes no difference how black and opaque the rock may be in fragments; its section is perfectly transparent, and the first glance into the microscope reveals each little mineral granule completely isolated, so that its form and color and cleavage are at once recognized. One sees quartz, feldspar and hornblende granules lying side by side or interlocking in the same manner as the naked eye perceives them in the coarse-grained granite. Then by means of an apparatus attached to the microscope for polarizing light, one is enabled to determine the exact crystal system of the mineral, with many other characteristics too abstruse to mention here, perhaps, all of which render the determination of the mineral altogether exact.

While this much, which the microscope has shown, is, perhaps, only what might have been suspected, but could not be proved, another entirely new class of phenomena has been brought to light, of the existence of which the scientist had scarcely dreamed, and yet of decisive bearing upon all of the important and, up to this time, totally unsolvable problems as to the mode of formation of the crystalline rocks.

The microscope has shown that most of the fine-grained rocks contain, besides their mineral constituents, a considerable proportion of undifferentiated glassy material, evidently the solidified residuum of the original melted rock fluid, out of which the minerals crystallized during the original cooling of the rock. Rocks are found containing different amounts of this glassy material, and, in fact, every transition has been discovered between the pure glass on the one hand, as seen in obsidian, and the completely crystallized rock on the other hand, a type of which is granite, in which all of the glass has been taken up by the minerals.

Crystals.

We find, further, that the material of which crystals are composed is generally very far from homogeneous. Little air or gas bubbles are very frequent. Minute cavities, partially filled with liquid, sometimes so completely fill quartz crystals that the astounding number of 4,000,000 has been estimated within one cubic millimeter. On the other hand, the largest of these liquid cavities rarely surpasses one-half millimeter in greatest diameter.

They are generally oval in form and contain a little bubble or vacuole spot, which, even in the smallest ones, is very commonly in a state of ceaseless motion, moving restlessly from side to side of its prison-house, as though anxious to escape.

It is an interesting thought, that every quartz granite in the huge granitic masses which make up the mighty Sierra Nevada range, those huge mountains that are taken as the very type of majestic repose, contains hundreds, if not thousands, of these minute liquid cavities, each with its little dancing bubble that has continued its ceaseless motion from the moment of its formation through all the illimitable geologic epochs of the past to the present day.

The liquid contained in these cavities is sometimes water, sometimes liquid carbonic acid, sometimes saturated solutions of common salt, in which latter case each little cavity contains, in addition to its bubble, a perfect little cube of salt. A lighted cigar, held under the slide, will cause it to dissolve, and you can watch it recrystallize when the heat is removed.

The liquid was, of course, in every case, present at the time of the solidification of the rock, and was imprisoned by the growing crystals. The cause of the bubble is evident. The liquid was inclosed at a much higher temperature than the ordinary temperature at which we now observe it. In cooling from its original to its present temperature, the liquid contracted more than the solid substance composing the walls of the cavity, and consequently drew away from these walls, leaving the little round bubble, the size of which is, of course, the exact measure of the increased contraction of the liquid over the mineral substance.

Other crystals, in a different class of rocks, contain, not liquid, but otherwise similar, glass cavities, likewise furnished with little bubbles (sometimes two) but, of course, quite motionless. This glass was enclosed in precisely the same way as the liquid above mentioned, and is a remnant of the true "mother liquor" of the crystals in which it is found.

Crystals used to be considered the purest form in which a mineral could occur, and were always carefully selected for analysis when the composition of the mineral was to be determined. We have learned now that the crystals of some minerals (such as augite) are so completely filled with other mineral crystals and granules that we shall, in all probability, never be able to obtain the pure mineral substance. These enclosed mineral granules are sometimes densely aggregated in the center of the crystal, leaving an external zone concentric with the outside of the crystal entirely free from them. At other times the center is free, and the inclosed granules fill the outer concentric zone.

The leucite crystals in the Vesuvian lava of 1858 present a beautiful instance where minute magnetite grannles are forced by the growing leucite crystals into concentric circles. I have counted as many as 25 or 30 of these concentric circles within a single crystal.

Origin and Growth of Mineral Crystals.

Still another class of phenomena has been observed by the microscope for the first time; we now know something about the origin and growth of mineral crystals. A crystal, as you ordinarily see it, is bounded by plain surfaces, and attains to a certain size by slowly attracting material from the liquid in which it is formed. Evidently, if we could stop the process of growth at an earlier stage, we might be able to obtain a complete series (corresponding to the embryonic series of the organic individual) from the very birth of the crystal to its completed form. This has been done synthetically, but of especial interest to us here is the fact that nature likewise has done it. Obsidian, or volcanic glass, found in the neighborhood of active and extinct volcanoes, is the product of the extremely rapid solidification of melted rock material, thrown out upon the surface. Freedom of molecular motion, which is, of course, the essential condition for the growth of crystals, becomes stopped by the solidification before the crystals have time to form themselves. In consequence, the most perfect obsidian is absolutely free from crystals. This is the one extreme, while granite represents the other, in which the process of crystallization has been so excessively slow (granite is formed at great depths, and hence cooled slowly) that the crystalline granules had time to take up and assimilate, so to speak, every molecule of the original rock liquid. Now, between these two extremes we have every possible transitional stage, found, of course, in different places and formed under different conditions, in which the cooling took place in a shorter and shorter period of time. This series is made up of finer and finer-grained granites; then glassy matter begins to enter into the composition of the rock and mix with the crystals, at first in the merest traces, scarcely discernible with the highest powers, then increasing in quantity relatively to the crystals, and finally in obsidian displacing them altogether. It is this glassy matter in some of the lower members of the series that is sometimes completely filled with what I shall call "embryonic crystals." Let us look at some of them.

The simplest form is a simple oval globule. It is remarkable that both the organic individual and the crystal (which is the inorganic individual) should begin their development from the same simple, cell-like form. In the next higher stage these little globules group themselves together in curved linear aggregates.

The next higher form they begin to branch rather irregularly. Then, in higher forms, we have straight linear aggregates, with branches at right angles. Then the globules coalese into long, cylindrical forms, that are sometimes so thin that the highest powers fail to show distinct boundary walls, when they appear as black, hair-like forms—straight, curved and spiral—or sufficiently large to be transparent. At other times, again, they take upon themselves lobed, double-lobed and dumb-bell forms.

Still more interesting are the forms in which these curiously shaped growths aggregate together. Thus, the hair-like forms arrange themselves in linear shape, or aggregate around an opaque granule in the most confused snarl imaginable, while the simple transparent cylindrical forms either aggregate into lineal groups, or else in branching aggregates; but perhaps the most beautiful of all are the forms seen in a pitchstone from the Isle of Man. These little groups here take the form of fern leaves of most complicated pattern, but of most exquisite symmetry, so that one seems to be viewing through the microscope a miniature petrified fernery. One can scarcely bring himself to believe that these are really inorganic shapes, and that crystalline, and not life forces, have been instrumental in their production.

(TO BE CONTINUED.)

The Engineer.

Launching a Ship by Means of Electricity.—In launching the English turret ship, Colossus, March 21, electricity was employed by means of an ingenious contrivance which connected the dog shores with a large magnet, and in a similar manner the christening was performed. Simultaneously with the breaking of the bottle over the ship's nose a musical instrument inside an ornamented box was set at work, and "Rule, Britannia," was the result. By this time the course was reported clear, and, as the ship gave evidence of anxiety to leave the cradle, it was deemed advisable, though ten minutes before time, to let her go. The pressure of the launching button was followed by a heavy thud. The weight had fallen and the dog shores had been knocked away. The ship moved instantly, and the huge mass of 4 420 tons—the heaviest ever launched from the Portsmouth yard—glided gracefully down the inclined plane into the harbor, amid the music of the bands and the enthusiastic cheers of the multitude.

The Great Wall of China.—An American engineer who, being engaged in the construction of a railway in China, has had unusually favorable opportunities of examining the famous Great Wall, built to obstruct the incursions of the Tartars, gives the following account of this wonderful work: The wall is 1,728 miles long, 18 ft. wide, and 15 ft. thick at the top. The foundation, throughout, is of solid granite, the remainder of compact masonry. At intervals of between 200 and 300 yards, towers rise up, 25 to 30 ft. high, and 24 ft. in diameter. On the top of the wall, and on both sides of it, are masonry parapets, to enable the defenders to pass unseen from one tower to another. The wall itself is carried from point to point in a perfectly straight line, across valleys and plains and over hills, without the slightest regard to the configuration of the ground, sometimes plunging down into abysses a thousand ft deep. Brooks and rivers are bridged over by the wall, while on both banks of larger streams strong flanking towers are placed.

Underground Railways.—The success of the elevated railway in New York appears not to have killed the project of an underground railway in that city. Some time since articles of incorporation were granted to the Beach Pneumatic Transfer company, and a bill was passed last year by the State Legislature, changing the name to the Broadway Underground Railway Co., and according to it all the rights and privileges possessed by the first-named corporation. One of the provisions of this bill was that a certain bond should be filed within one year. In accordance with this requirement, a bond for $100,000, as a guarantee for the completion of this railway within four years from July 1, 1881, has been recorded, with proper sureties. It follows that this amount will be forfeited in case the work is not accomplished within the time specified.

Wave Power.—*La Nature*, of Paris, gives an account of an apparatus, designed by M. Ganobez, for utilizing the force of waves, and consisting essentially of a float, weighing from 35 to 95 tons, which is connected with a bell-shaped compressor by ropes or chains passing over pulleys. The float is submerged, and rises and falls with the waves. When it falls it raises the bell, which has previously been below the water level, and as it empties itself of water the air rushes into it through openings in the top. As the float rises again, the bell sinks, the water rises in it and compresses the air, driving it out into pipes which conduct it to reservoirs on shore, whence it can be distributed as required.

Mississippi River Improvements.—It is estimated that from $80,000,000 to $100,000,000 will be required to make the Mississippi river a highly serviceable and safe stream for Western commerce. The immediate result will be to reclaim 32,000 square miles of land, worth, at $10 per acre, $20,000,000, and capable of producing $300,000,000 worth of products. The Mississippi Valley Cotton Planters' Association, which is to hold a convention in Memphis, Tenn., on May 25th, proposes to appeal by petition to the Government, to take the project in hand. Is this not a most legitimate object for Government aid, where millions of square miles and millions of population are interested?

Railway Construction in 1882.—What effect the strikes of the iron-workers may have upon railway construction during the rest of the current year cannot be told; thus far the work has greatly surpassed that of last year, when the increase of mileage—between 9,000 and 10,000 miles—exceeded that of any previous year. Indeed, during the first 5 months of the year the increase was more than double that of the corresponding month of 1881. According to statistics compiled by the *Railway Age*, in 36 States and Territories, on 120 roads, no less than 3,480 miles of new railway were laid down during the time mentioned.

The French are, by common consent, the custodians of the standard measures of the world. Our Government standards have been, at several periods, recompared with the French, and the differences noted.

Useful Information.

Fire-Proof Ink and Paints.

It appears that the effort to manufacture a fire-proof paper and ink for either writing or printing purposes has recently met with success in Germany. Paper possessing fire-proof qualities was made with chemically-treated asbestos fiber and ground or finely divided wood fiber. Ninety-five parts of asbestos were used with five parts of the wood fiber, and by aid of glue, water and borax were made into a pulp, which yielded a fine, smooth paper, which could be used for writing purposes. It had the unusual quality of sustaining the influence of a white heat without injury. Fire-proof printing and writing inks were made by combining platinum chloride, oil of lavender, and lamp-black and varnish. These ingredients produced a printing ink, and when a writing fluid was wanted, Chinese or India ink and gum arabic were added to the mixture. Ten parts of the dry platinum chloride, 25 parts of the oil of lavender and 30 of varnish are reported by a local writer to yield a good printing ink of this valuable kind when mixed with a small quantity of lamp-black and varnish. When the paper printed with this compound is ignited, the platinum salt is reduced to a metallic state and becomes a coating of a brownish-black color.

A fine flowing ink for writing on the fire-proof paper with an ordinary metallic pen, may be obtained by using 5 parts of the dry chloride of platinum with 15 parts of oil of lavender, 15 parts of Chinese ink and 1 part of gum arabic, adding thereto 64 parts of water. When the paper is ignited after being written upon with this ink, the platinum ingredient causes the writing to appear transparent, and, as a consequence, it is claimed that such writing as has become black or illegible, will become readily legible again during the process of heating the paper.

Colors for painting may also be made fire-proof by mixing commercial metallic colors with the chloride of platinum and painters' varnish, adding an ordinary aquarelle pigment to strengthen the "covering power" of the color. These fire-proof paints or colors can be easily used in the same manner as the common water colors, and it is claimed they will resist the destructive influence of great heat quite as successfully as the fire-proof printing and writing inks above referred to.

Potentite.—English mine owners have recently been much interested in some experiments made with a new explosive called "potentite," which, although it has not been before the public very long, is strongly advocated by many who have tried it on account of its cheapness, safety and effective results. Experiments made at the Devon Friendship mine, England, it is said, have proved highly satisfactory. The explosive was first tried underground, with great success and freedom from noxious gases. Some interesting experiments with potentite and dynamite were afterward conducted at the surface. A solid piece of cast-iron, 7 ft. long, 21 in. wide, and 2½ in. thick, was fired with two ½ cartridges, and the entire block was blown to pieces. A smaller quantity would probably have been sufficient for the work. Dynamite when tried upon a similar block appeared to produce no perceptible result. Potentite does not contain its own means of ignition, and may be transported and stored with perfect safety. This is an important point as affecting railway authorities, who will transmit the explosive without any objection. A cartridge of potentite is stated to be much lighter in weight than the same sized cartridge of other explosives, though equally effective, and, in instances, superior.

Shoo, Mosquito!—Apropos of the numerous witty reflections on mosquitoes going the rounds of the press just now, is the suggestion of a writer in *Nature* that quassia-water is a protection against the attacks of those syrenic insects. He tried a weak solution on a child's face, which had become grievously tormented, and it worked to a charm, preventing the gray-backed suckers from dining on the baby's rosy dimples. All that is necessary is to moisten the face with the solution of quassia. It should be weak for this purpose, for a strong solution of quassia is an active poison to flies, sugar being mixed with it to attract them; but it is not powerful enough to kill the insects very quickly.

Purifying Lubricating Oils.—A German chemist, M. Kœllner, makes use of the following process for purifying lubricating oils and so renders them fit to be used again: He first puts the liquids into the lower part of a reservoir, closed at the top by a perforated lid; the residue is deposited at the bottom. By raising the reservoir at one end the oil passes into a second reservoir, then into two boxes joined together, filled with a very clean cotton waste, and separated by a vertical perforated plate. The air circulates freely in the different apparatus, and the oil is then in a condition to be used immediately.

Boiled Onions, to be free of strong odor, should be boiled in salted water for 10 minutes, and then put in cold fresh water for half an hour; after that they should be put into a stew-pan with just enough cold fresh water to cover them, and boiled gently till tender. Drain and serve with melted butter.—*Sanitarian.*

Preservation of Rubber.

Every one who uses vulcanized rubber is aware that the articles made of it will, in a longer or shorter space of time, get hard and brittle, so as to be useless. Hempel has been investigating the cause of this hardening, and has come to the conclusion that it is due to the gradual evaporation of the solvents employed when vulcanizing it. He has been trying to find some method of either preventing this evaporation, or of replacing the solvent by some other one. In this he was quite successful. If the India-rubber was put directly into the solvent it always absorbed too much of it, but the object was attained by putting the article in an atmosphere saturated with the vapor of the solvent, rubber stoppers, tubing, etc., which is perfectly elastic, is protected and prevented from spoiling by putting it in a dessiccator or large glass box, in which is an open vessel of ordinary kerosene.

Simply sealing hermetically in a glass vessel preserves India-rubber for a long time. It is totally useless to try to keep it in a wooden box. As far as practicable it is to be kept in the dark. Old rubber that has become hard is softened in a very short time by putting it in a vessel with vapors of bisulphide of carbon. The action of bisulphide is, however, too powerful if it lasts too long, hence it must be taken out and put in the vapor of kerosene afterward. This simple regenerative process does good service for hard stoppers; but tubing generally does not get fit to use again, as the little cracks and checks that form when it gets hard cannot be closed again.—*Scientific American.*

To Clean Marble.—Mix one-quarter of a pound of soft soap with the same of pounded whiting, 1 ounce of soda, and a piece of stone blue the size of a walnut. Boil these together for 15 minutes, and then, while hot, rub it over the marble with a piece of flannel, and leave it on for 24 hours; then wash it off with clean water, and polish the marble with a piece of coarse flannel, or, what is better, a piece of an old hat.

Improving the Memory.—All the methods of improving the memory are based upon the principle of attention. Whatever you study or observe should be earnestly regarded. The mind should not be permitted to wander off to side issues. Outside matters generally should be ignored for the time being. Memory, of course, depends first upon the organization, next upon its use of training.

Water for Fire Purposes.—The water used by the New York Fire Department last year was 33,102,000 gallons, or a little more than one-third of one day's supply for household purposes.

Good Health.

Meat, Manure and Blood Poison.

John Archer, a vigorous farmer of 45, living at Randolph, N. Y., has died, and, in the opinion of his physicians, from poison received into his system while spreading a prepared phosphate on a field. He perspired freely, and the poison was taken in through the pores of the skin and into the lungs. It is claimed that when animals die of certain malignant diseases, the poison penetrates even their bones, and may be retained in the phosphate prepared from them.

Quite recently the attention of the French Academy of Sciences was called to the poisonous effects of the odors rising from the ground in which sheep had been buried that had died from the disease known as "scab," or "anthrax." The ground was on a barren waste about 10 miles from Paris, and was selected by the authorities for the disposal of sheep that died of that disease, which was prevalent 5 and 10 years ago. It was surrounded by a high and tight fence, so that animals could not enter it. A distinguished chemist placed five young and healthy sheep in the inclosure, keeping them during the most of one day in the corner where the sheep that had died 10 years ago of the scab had been buried. At night they were all taken out and placed in feeding pens, where they were allowed an abundance of fresh food and water. In a few days they showed symptoms of disease, and notwithstanding that the best attention was paid to them, they all died. The same number of sheep was then placed in this inclosure, and kept over the spot where the diseased sheep were buried five years before. They, too, all suffered and died from the same terrible disease.

More recently, an intelligent gentleman in New York city has called attention to the circumstance that the worst forms of malaria are now common in the oldest settled portions of Massachusetts, New York and New Jersey, which only a few years ago were considered the most healthy localities in the country, and on that account were much frequented by invalids. In the opinion of doctors, these places have become unhealthy on account of the use of blood and meat fertilizers. Most of the land in these section has fallen into the hands of men of large means, who have spared no expense to render the land as productive as possible. They have applied animal fertilizere to the land liberally, and in the opinion of the medical men, have poisoned the air that passes over the land. The best way to dispose of the bones of all animals that die of contagious or malignant diseases is to burn them. It is better to have only the ashes than to take the chances of disease.

The Wooing of Sleep.

An endeavor to go to sleep is a mistake. For example, when the will makes an effort to dull the ear the mental sense behind the sense organ is thrown into a condition of listening and tension. The power of hearing is not diminished, but, as it were, restricted in its range and in its heightened sensibility—as the vibratile capacity of a musical reed may be raised by reducing the length of the fiber along which its vibrations are propagated. Noises that would not previously have been noticed are perceived, and become sources of annoyance. This intensifying of the sensations in the attempt to go to sleep, of which most persons are conscious, is doubtless partly due to the quiet that prevails in the house and bed-chamber; but there is also an increase of the susceptibility of the perceptive faculty, frequently to such an extent that the ticking of a watch or the tapping of an insect behind the wall-paper will not only be heard, but be actually painful.

So it is with sight; when the eyelids are closed the inner mental sense of vision becomes increasingly acute, and the field of sight is soon crowded with grotesque and rapidly changing images. The worrying effect of this phantasmagoria is a too familiar experience of the sleep-waiter. All the mental senses are in like manner stimulated and their acuteness intensified by the endeavor to lower the sensibility of the sense organs. The mental sense of smell may be rendered so keen that the scarcely perceptible odor of bed-linen will prove offensive. Taste may be so stimulated that the natural moisture of the mouth becomes loathsome. General sensation may be so intensified that a rough thread in a sheet, or a little stream of cold air finding its way under the coverlet, will occasion the most irritating experience. In short, the whole process of attempted senses-subduing is unnatural and opposed to the dictates of reason.

No such effort ought to be made. External quiet should be secured, if quiet be personally agreeable, and whether light or darkness be preferable must depend on the idiosyncrasy. No control ought to be exercised over the senses. The eyelids should not be closed, but allowed to droop when weary. There should be no resolution to disregard sounds, or to suppress sensations of any kind. The surroundings being propitious and consonant with the "feelings," or, still better, disregarded, mind and body should be left to take their chance of sleep, without the striving which, in truth, is the principal cause of wakefulness. This is why it often happens that persons who cannot sleep in bed by night will drop off to sleep readily in a chair by day. It is the effort to sleep that keeps off slumber, and when there is no effort, sleep comes naturally. If the endeavor to sleep is made, as soon as it commences expectancy begins, and, paradoxical as it may seem, the consciousness is actually kept awake to watch for sleep! This watchfulness, arising out of the eagerness of the desire for sleep and the intensity of the effort made to woo it, throws the mind into a state of tensive anticipation incompatible with somnolence. Then comes the period of restless and irritated disappointment, in which the mind is so vexed, the brain so excited, and the organism, as a whole, thrown into such a state of irritability, that the best thing to do is to rise and take a bath, or wash from head to feet, with the double purpose of allaying the excitement and inducing a more peaceful mood by physical exercise.

O, Heaven! for one generation of clean and unpolluted men—men whose veins are not fed by fire; men fit to be companions of pure women; men worthy to be the fathers of children; men who do not stumble upon the rock of apoplexy at mid-age or go blindly groping and staggering down into a drunkard's grave, but who sit and look upon the faces of their grandchildren with eyes undimmed and heart uncankered. Such a generation as this is possible in America; and to produce such a generation as this the persistent, conscientious work of the public press is entirely competent as an instrumentality.—*Dr. J. G. Holland.*

Biting the Nails.—It is a bad habit for one to get into, for the reason that those who become addicted to it forget themselves, wherever they may be, and when embarrassed they are especially apt to indulge it. The injury which is done in most cases to the fingers is one of deformity—who likes to see the stubby, uncouth finger-ends which inveterate nail-chewers show? We have the impression that the practice has a mischievous effect on a person's mouth, distorting its shape, perhaps thickening the lips, possibly giving an abnormal tendency of growth to the jaws and teeth.

Temperament in the Negro.—Phrenologists of experience are able to discern differences of temperament in the negro, but no positive rules have been laid down concerning him as in the case of the Caucasian. It remains, therefore, for the physiologists and anthropologists to classify the Negro and the Mongol temperaments. Here is a good field for wide study. We should be glad to hear from those who have had opportunities to study the races of Asia and Africa, and to communicate their views through our columns.

Sonoma Valley College, John F. Burris, Sonoma, Cal,

Passing Events.

In another colmn we give an acconnt of the debris conference held at Marysville to see if some arrangement, satisfactory, in a measure, to both parties, cannot be arrived at, which shall put a stop to the litigation in progress, so expensive and so harren of resulte to all but the lawyers.

There is not very much of a novel character going on in the mining world other than we have noted elsewhere.

The topic of all tongues is the war in Egypt. War at a safe distance, with all the advantages of special reporters and cable dispatches, seems to strike the average person as something rather desirable to vary the monotony of midsummer. The news of the bombardment of Alexandria is looked for with the greatest anxiety, and the destruction of the Suez canal, although it would be a piece of outrageous vandalism, would serve to gratify a taste for sensations. The excitement, however, does not promise to last long, unless it should be necessary to fight the Egyptians in their distant retreats and to patrol the desert for the Bedonin. For one day's work with the English gunboats laid low the fortifications and filled the city with conflagrations.

MINE SOLD.—That veteran and untiring prospector, George Lovelock, of Lovelock, has sold an interest in one of his nickel mines to Bell & Curtis, of San Francisco, for $8,000, cash down. Mr. Lovelock has been prospecting a long time, and in early days made several sales of mining ground; but this is the only sale of any consequence he has made for years. Such perseverance as he has displayed deserves a rich reward.

SUPERINTENDENT CHURCH, of the Tombstone mining company, is at present in Philadelphia. A note received by Commissioner Sorin from him states that, next to Colorado, Arizona will have the best place in the exposition building.

Foundry Notes.

Dredging Machinery for the Panama Canal.

The largest job of work being done at any of the San Francisco foundries at present is large and heavy dredging machinery for the Panama canal, which is being constructed at the Golden State and Miners' iron works. The machine is capable of handling 10,000 cubic yards in a day of 10 hours. There are about 300 tons of iron in the machinery, and it will take some 400,000 feet of lumber to build the scow and frame. The large scow is being built in New York, and the machinery will be shipped from here by rail to that city. The scow will be towed to her destination, but is arranged so that in heavy weather sail can be made in case it parts company with the steamer.

The dredging machinery is being built on about the same plan as that for General Williams, which has been doing such effective service in the tule lands of this State. The form is one which has proved very effective by experience. It is a bucket dredge, with endless chain. There are about 40 buckets, and 16 a minute discharge into a large pipe at the top of the machine, the mud passing through this pipe to the point where the levee or bank is to be formed. The pipe is some 200 feet long. A hydraulic nozzle is used where sand is dug, so as to wash the sand out of the buckets in case it sticks, and it then passes into the pipes. In digging mud this is not necessary.

A machine of this type dug, since the 25th of November, a canal 5½ miles long, 85 ft. wide and 11 ft. deep. One month of this time they did not run, owing to some legal complication. One more month they were detained by the survey work. Notwithstanding this, and ordinary detention, it will be seen that an immense amount of work was done. This was on Union island. On the other side of the island a canal has been dug 3½ miles long, 150 ft. wide and 14 ft. deep. In another place, a ditch 1½ miles long, 90 ft. wide and 8 ft. deep, has been dug. Levees are made with the dirt excavated. Two cut-offs in the river have been made for the Government. The dredge also deepened the channel at the mouth of Stockton slough. A channel 3,000 ft. long, and 200 ft. wide was cut, taking off from one foot to 10 feet of material. All this work was profitably done. No other machine, it is claimed, could have come out even in the job; but with this they made money.

The main driving engines for the new dredger are each of 100 horse power. There is nothing fancy about them, but they are solid, compact and strong. There are also three other pairs of engines of 20-horse power each, for handling the spud, raising and lowering buckets, etc. The buckets hold two cubic yards each, when running full, but, of course, do not always load up evenly.

Such is the mechanical arrangement of this invention that only five men are required to manage it. Steam is employed for all purposes, and so arranged on the levers, etc., that one man has control of the mechanism. The boat being built for it is 100 ft. long and 60 ft. wide. The engines are now nearly completed. This week they are engaged in preparing the molds for the fly-wheel, gear, etc. The whole thing will be done in August ready for shipment.

It would be difficult to give a clear idea of the details of construction of this machine without the aid of engravings. It was found the machinery could be made here cheaper than in Pittsburg or elsewhere East, even taking the expensive freight bill into consideration.

The Mining Exposition.

If we may judge by the comments of the local papers, Arizona and Utah will probably be best represented at the Denver Exposition in the matter of minerals. Colorado itself will, of course, make a good display; but there is not that enthusiasm displayed that might be. In Arizona, a comparatively new region, they want to advertise the country, of course, and as they have not been called upon for similar occasions previously, they will no doubt come forward more willingly than others. Idaho and Montana will not be represented in a manner at all commensurate with their development, and Nevada and California will make no show at all.

It was only this week that a Commissioner was appointed from this State. The person selected was Mr. Warren B. Ewer, editor and publisher of the MINING AND SCIENTIFIC PRESS. It is too late for the Commissioner to undertake to make any collection for exhibition at Denver, but he will, of course, take charge of all that is forwarded to him, or that is received there from California.

This State could, of course, make a very fine display, but there is no money available to carry out any plan, and the Commissioner must pay his own expenses and receive no compensation. It is impracticable to send any display from here now, and none at all is better than a poor one. California can afford to stand aside and let younger mining regions take the honors to be reaped in this connection. Her hullion product of $18,000,000 or $20,000,000 a year will speak lively enough in her praise.

At the same time it is to be regretted some move was not made at an earlier date to have the State fall into line at this Mining Exposition, for none could bear its share more readily and more fully.

Placer Gold.

Experiments With California Gold.

The following interesting paper was read at the last meeting of the San Francisco Microscopical Society by Henry G. Hanks, State Mineralogist:

Some years ago I read a paper before this society on "Rusty Gold," giving the result of my experiments and observations up to that time. I have since continued the study of placer gold in this abnormal condition, which has led to the discovery of important facts, bearing on the production of gold in California, and, as these discoveries must, to a great extent, have remained unknown were it not for the microscope, I consider this society the proper medium through which to make them public.

For many months I have conducted a series of experiments in my private laboratory on placer gold from numerous localities in the State. I have also studied the behavior of gold in the presence of mercury under all conditions I could think of, the results of which have been carefully recorded and preserved for publication, the most important of which may be summed up as follows:

Gold and Quicksilver.

When perfectly clean gold is exposed to the action of pure quicksilver it is instantly seized by the latter and coated with amalgam. The accident of gold being alloyed with other metals in nature does not impair its affinity for mercury, if the surface is made bright mechanically by filing or scraping. Much of the native gold found in placer mines, apparently clean, is slightly tarnished by the oxidizing or mineralizing of its alloy, in which case it amalgamates with difficulty. I have failed in every instance to find gold in quartz in this condition, although intelligent miners have informed me that they have sometimes observed it in their experience. A large proportion of the placer gold found in California is wholly or partly coated with silica, cemented by sesquioxide of iron, as stated in my former paper. When wholly coated it is perfectly inert to the action of mercury (one might as well put gold in a glass bottle and attempt to amalgamate it from the outside). When partly coated, the exposed parts become amalgamated, and to that extent only is the gold held by the mercury. If rusty gold is digested in hydrochloric acid the iron is dissolved, and a slight mechanical force then serves to detach the silica, when amalgamation takes place without difficulty. There is no hope of being able to free the gold from this coating during the few hours it is exposed to the forces employed in the well-known hydraulic process. When clean gold amalgamates it does not become homogeneous, but the amalgam forms only on the surface. I have had a piece of placer gold in mercury, standing in my laboratory, for several months, during which time I have frequently triturated it—sometimes several times a day—and it is not yet dissolved; still, in passing from one vessel to another, the mercury flows freely without showing the gold, but I can at any time fish it up with my finger. Gold, so amalgamated, could not, in the process of placer washing, escape from the mercury, but coated gold, under the same circumstances, will float on the surface of the quicksilver, and any slight force sufficient to overcome its specific gravity will detach it.

Artificial Imitation of Coated Gold.

The coating of gold may be imitated, as found by experiment. A piece of pure gold, after annealing, was placed in pure mercury, and it instantly became amalgamated. Another portion, exactly similar, was hammered on a perfectly clean and polished anvil, with a polished hammer, and placed in mercury like the first. It became as quickly amalgamated. Pure quartz was then ground to a powder and sifted on the anvil in a thin stratum. A third piece of the same gold was then laid on the powdered quartz, struck several times with the hammer, turned over, placed on a different spot, and again hammered. The gold was then examined under the microscope, and seen to resemble the coated gold found in the placers, the quartz particles being imbedded in its surface. When placed in mercury, and allowed to remain for some time with frequent agitation, it floated on the surface, and seemed to be wholly unacted upon, but when placed under the microscope it was found that the mercury had attacked the gold through the small interstices, but only to a very limited extent. The gold was then placed on an iron slab, and gently rubbed with an iron muller, by which treatment it became more perfectly coated, and was now an exact imitation of the natural coated gold, minus the iron cement. In the natural coating of placer gold I consider the cementing to be a secondary process, and the sesquioxide of iron to result from the decomposing pyrite, which was abundant in the quartz veins that yielded the gold.

Genesis of Auriferous Gravels.

I have reason to believe that we have been generally mistaken as to the genesis of the auriferous gravels in the beds of the ancient rivers; for river beds they are, without a reasonable doubt. But the theory that these immense bodies of gravel were deposited by a great flood, by a series of floods, or by long deposition by the rivers themselves, does not account for the gold in them. The microscope seems to show that they are not river sand at all, and have never been far removed from the place that gave them birth. I have examined samples from many localities, including some of the most noted hydraulic mines in the State, and the result is invariably the same. The sand grains are all sharp and angular, and not at all worn as are those from the sea-shore, the great Colorado desert, the agricultural soils, and the beds of the present rivers. To verify these results, I pulverized quartz on an iron slab to different degrees of fineness, and examined it under the microscope, finding it identical with the sands from the gravels of the gold placers.

Ancient Riverbeds.

That the beds of the auriferous gravels are channels of ancient rivers seems to be proved by an examination of the surfaces exposed in the hydraulic mines, in which may be seen deep pot holes worn by bowlders kept in violent and long-continued motion, the little deposits of magnetic sands under the lea of protecting bowlders, marks of eddies, and by the fact that all flat bowlders on the bottom overlap like shingles on a house-top, the small ends being invariably down stream. That the channels were filled by the rivers themselves seems to be as clearly disproved by the fact that gold is distributed throughout the whole mass, from bedrock to surface, by the sharp angular sands, and by the coated gold. Water must have flowed in the ancient rivers comparatively free from obstruction for a long period before the deposition of the gravels to admit of the deep pot holes being worn in the hard rocks. From the examination of the hydraulic sands, it is fair to infer that the same force that crushed the rocks set the gold free, flattened the grains and coated those which passed between the rocks and the grinding force, in a manner similar to that pursued in my experiment mentioned before.

Material Moved in Hydraulic Mining.

To convey an idea of the enormous quantity of matter moved in hydraulic mining, calculations have been made from published data, in which the gravel moved is compared with the gold produced. At the Sailors' Union mine, Iowa Hill ridge, 1.615577 parts, by weight, were washed away to obtain one part of gold. At the North Bloomfield, in Nevada county, the removal of 12.107116 parts of gravel was required to yield one part of gold. A mechanical analysis of hydraulic gravels was made from the well-known hydraulic mines, from which it would appear that a large portion of troublesome mining debris might be diverted from the river bed, where the contour of the country will admit, and spread harmlessly on some hillside, or deposited in a canyon, where it could do no damage. A sample from a pillar in the Nevada mine chalk bluffs, Nevada county, contains:

Large pebbles.....	39.80%
Smaller.....	29.80%
Total.....	69.60%

The remaining 30.40% would all pass through a grizzley, the bars of which were one inch apart. If the large bowlders in the mine could be calculated, it would greatly increase the percentage of coarse material. A sample of gravel from the Polar Star mine at Dutch Flat, Placer county, gave 40% of coarse matter, but as it is well known that the majority of the filling in the channel at this mine is large bowlders, this analysis is only interesting as showing that 40% of the comparatively fine gravel is coarse enough to be separated by properly-constructed gratings.

Washing with Pan.

To show the relation between hydraulic mining and pan washing, I submit an analysis of the latter which is perfection itself for saving gold, although hydraulic mining claims to be the same on a gigantic scale. The skillful miner, in washing a panful of dirt, unconsciously divides the operation into five stages: First, he allows a certain quantity of water to flow over the rim of the pan as he holds it in a convenient stream or prospecting trough. He breaks the lumps with his fingers and stirs the contents of the pan until a soft mud is formed. Sinking, now, the pan beneath the water, the second stage commences. This is to so agitate the muddy prospect that gold, gravel and coarse sand sink to the bottom, while the finer and lighter particles flow over the rim and escape. This being for a time continued, the remaining contents of the pan become clean and the water is no longer loaded with slickens. The third operation is to pick out carefully all the large pebbles and gravel which are examined, and, if found worthless, are thrown aside. The agitation is continued with but little water in the pan, and by a motion of the ball of the thumb, difficult to describe, the coarse particles are raked out and rejected. At this stage a very large proportion of the original prospect has been removed, but every grain of gold lies at the bottom, although still invisible. The fourth operation is to so agitate the remaining contents of the pan (now inclined and only partly under the water) that the coarse sand flows over the edge in a thin stream, every particle passing under the eye of the operator, who maybe certain that no gold escapes. This is continued until but a small quantity remains in the pan, when, lifting it from the water, the last operation begins, which is the concentration and perfect separation of the gold. This is effected by an undulatory motion, causing the sand to flow with the water across the bottom of the pan, revealing a cluster of gold particles, if the dirt is rich, and wholly isolated. The pan is then inclined toward the sand, leaving the gold stranded in one portion, and the sand and water lying in another. The edge containing the sand is then held over and very near the water, of which the miner lifts a small quantity in the hollow of his hand, and, pouring it behind the sand, washes it away, leaving the gold only in

the pan. There being no quicksilver used, the gold is collected wholly by its specific gravity, and rusty or coated gold particles would be found with the other gold, although it might be mistaken for something else, and thrown out as worthless, by an inexperienced prospector.

Imperfect State of Hydraulic Mining.

After a careful study of this most interesting and important subject, I cannot evade the conclusion that hydraulic mining, notwithstanding its wonderful advancement, is still in an imperfect state. I am convinced that more gold is lost than is generally known, or miners are willing to admit. This being granted, a remedy should be sought, and as theory is not always confirmed by practice, experiments on a moderate scale should be made, based on the experience of miners, who are aware of the loss, but helpless to prevent it.

Modified Methods of Separation Suggested.

It is my opinion that the methods now employed in hydraulic mining should be materially modified. As far as the disintegration of the gravels is concerned, nothing could be better, but the very force used in this operation defeats the object if carried too far. I consider it a foregone conclusion that coated gold cannot be saved by the use of quicksilver alone, and that it, with much of the fine gold, is carried forward by the great force of the water in the sluices and lost in the dump. This force, necessary to wash down the gravel banks, is not desirable in the sluices; on the contrary, it is highly detrimental, if the great mass of the worthless material can be got rid of at an early stage of the operation, as practiced on a small scale in pan washing. It is only to carry this debris through the sluices that this powerful current of water is required.

A Suggestion.

It is easy to find fault with the working of any process in use, but not so easy to propose a remedy. What I am about to suggest is purely theoretical, and may not work in practice, but it is worthy of the consideration of miners. The "grizzley" is a grating of iron bars now used in nearly all hydraulic mines of the State, to sift out—on a large scale—the bowlders present in the flowing debris, and it is a recognized principle to do this as early as possible. The debris freed from the larger bowlders passes through the sluices more freely, after which it is caused to flow over the pavements and dropped on the bedrock. But there is a point beyond which this treatment should cease. The proper point being decided upon, a set of grizzlies should be introduced, diminishing in fineness until the last one is no wider between the bars than twice or thrice the width of the largest particles of gold found in the mine as learned by experience. What remains on the grizzlies should be conveyed to the dump by a special channel, using a large portion of the available water for that purpose, or, when possible, shot off into some lateral canyon or depression. To divide the water, and at the same time to allow a portion to pass through with the fine gravel and sands, the bars of the last grizzley should be laid at right angles with the current and given the proper grade, which can only be learned by experience. What passes the last grizzley should be conveyed—using the remainder of the water—through sluices, as at present, but with less grade, and so constructed that a considerable portion of the heavier matters should remain in them, including the gold, arrested by properly constructed riffles. From this point it might be necessary to have double sluices, one to be used while the other is being cleaned up.

At proper periods, as determined by experience, the accumulations should be removed and concentrated, using either of the well-known concentrators for that purpose. Rusty gold would thus be saved by its specific gravity, which is know to escape the quicksilver, while fine gold, moving more slowly in the less inclined sluice beds, would find its way to the bottom and be saved. This is attempted now, in the undercurrents, but the fault with them is that there is too little space provided for the accumulation of the heavier parts of the material washed, and the absence of the secondary concentration.

Small bowlders are now rushed through the whole length of the sluices, and dumped into the rivers, miles away. It is absurd to suppose that gold should not be carried forward with this rush of water, and specially so after the interstices between the pavement blocks are filled.

At the American mine, Nevada county, there are 20 undercurrents, and gold is saved on the last one. Is it supposable that another would not also save a portion of the precious metal? It is a well-known fact that diamonds exist in the gravels of some of the deep placers, and it may be assumed that they are also in others, not now known. Yet it seldom occurs that one is found, which I consider another proof that too great a force of water is employed in the sluices below the bedrock tunnels.

This proposed improvement is clearly based on the results of my experiments, and it seems to be theoretically correct, but how it will meet the views of experienced miners, or how it will work in practice, remains to be proved.

Precedence in Mining Applications.

The Big Flat Gravel mining company appealed to the Secretary of the Interior from the decision of the Commissioner of the General Land Office, directing the Register of the Land Office at Humboldt, Cal., to reject the application for patent filed by said company on the 24th of April, 1880, and to receive and order publication of notice in favor of the conflicting applications of the Big Flat Gold mining company and Mountaineer mining company, offered for filing on the 26th of the same month.

This matter was previously before Secretary Schurz, and the acting Secretary declined to interpose in any manner to affect matters resting solely upon the diligence of competing parties in placing their applications on file in a proceeding to obtain patent for mining claims. "First in time, first in right," was held to be the only rule of precedence, whether it should result in placing one or the other party in the affirmative position of applicant, or in relegating him to the less enviable status of an adverse claimant upon whom is thrown the burden of taking the affirmative in the courts.

It is true that by a subsequent decision direction was given to allow priority in all stages of the proceeding, including delivery of the plats, to the first applicant for a survey in the office of the Surveyor-General; but this could not affect the surveys in question, and only had relation to a rule of procedure upon subsequent applications for survey. As to priority of applications for patent, it was distinctly held that the first survey presented should be accepted, and publication ordered.

It was shown in the case that the Big Flat Gravel mining company had succeeded in making the first survey, and placing the field notes of the deputy before the Surveyor-General for approval; that he held them suspended to await the subsequent return of the conflicting surveys; that in consequence they were all before him at the same moment; that he announced his intention to approve and deliver them simultaneously; but, on order from the General Land Office, approved and first delivered on the same day the plats of the Big Flat Gold and the Mountaineer mining companies.

By reason of less work in making the surveys, the Big Flat Gravel M. Co. did succeed in first executing their field work. The Secretary fails to see why the omission of conflicting surveys afterward made, even although first approved, should, under such circumstances, invalidate the plat, so as to compel its rejection, "on its face," and preclude the Register from ordering publication on an application otherwise acknowledged to be *prima facie* complete. It appears that this was done on account of a protest from a messenger of the other companies, who urged his complaint before the Register, claiming that, after great diligence, he had been unable to anticipate the other party and file his own application, and demanding that the pending application should be rejected, to allow him to gain further time in presenting his.

The Secretary of the Interior says now that this was not a good reason, and adds: "The parties acknowledge that they have sufficient notice of the conflict in the claims, and only desire to force the other company into the position of adverse claimants, assuming that it was the intention of your office to use its instructions to effectuate that purpose. But, as before stated, there can be no propriety in the assumption by this department of any authority whatever for the purpose of aiding or hindering the presentation of a lawful claim, in opposition to any other such claim depending for its consideration on the sole question of priority. The private rights of parties are to be adjudicated upon the cases when presented, and not admitted by privilege depending on any preconceived opinion as to the superiority of right in either.

"The Department is open to the first applicant for the consideration of all questions here determined, and the courts are also open in mining cases for the adjudication of adverse claims affecting the right of possession. It is entirely immaterial to the Government which party makes the application. Patent is, by law, made to follow the judgment of the court.

"I think it was error in this instance to reject the application first offered, and the decision of your office is accordingly reversed."

The Redwood Industry.

We give on this page a sketch which may suggest the redwood industry and call forth some comments upon its extent and the value of the timber prepared for use. Of redwood lumber and timber it may be said that it is the mainstay of our carpentry and building, and its production is a leading source of wealth in several of the coast counties. This may be inferred when we cite the figures of redwood production for 1881. The following is the total mill shipment as furnished us by the Secretary of the Redwood Manufacturers' Association:

	Feet.
Rec'd in San Francisco bay	95,414,556
Shipped from Mills to other points, foreign and domestic	35,051,158
Total mill shipments	130,465,714

The value of this lumber, figured at $18 per M is $2,348,370, which is certainly a respectable amount when it is considered that it is for one variety of timber.

Redwood has many excellent qualities, but one which we would especially emphasize at this time is its durability, as this has been called in question by correspondents of Eastern papers. We can best demonstrate its lasting qualities by the enumeration of instances which have been reported to us by one who is well informed in the manufacture and use of redwood.

There is now standing in Santa Cruz a split picket-fence built in 1841, by J. P. Springer, of redwood pickets, most of them one inch thick, and it is perfectly sound to-day.

Redwood fences made of split pickets, at Trinidad, in 1852, are sound and still in use.

F. P. and J. A. Hooper, in building a railroad at Trinidad, were obliged to fell a redwood tree 150 ft. high and 10 ft. in diameter, which had grown up beside a fallen redwood tree, and the roots of 10 inches in diameter had grown over the fallen tree. The fallen tree was found to be sound, and stringers for a trestle were cut from it.

At Fort Ross, on Myers & Bennet's property, there is a corral of hewn redwood and fences built by the Russians 60 or 70 years ago. The ends of the timbers and fence posts which are in the ground are sound to-day.

At the corner of Montgomery and California streets there is a piece of redwood pavement that has been in use for 20 years. The durability of redwood depends upon the place in the tree from which it is taken. Near the butt the wood is full of sap and very heavy and dark-colored, and will last indefinitely. The lumber men say that redwood which will weigh five pounds to the foot, board measure, will not rot in 50 years. The lumber nearer the tops of the trees is soft and not so durable as the butt, and yet even the top redwood will outlast pine when exposed to the elements or in contact with the earth. There is a corral which was built 30 years ago from the timber from a single tree. The man began cutting and setting posts from the butt of the tree upward. The first posts to rot were from the top of the tree and the decay followed around the corral until the posts from the lower end of the trunk were reached, and they are sound now.

Redwood has come into request for export eastward, where it is used in panels for its beautiful color and grain. It is also coming forward in fine cabinet work in our own State for beauty rather than hardness.

THE LUMBER INDUSTRY—HAULING REDWOOD FROM THE FOREST.

Killed in a Mine.—The Eureka (Nev.) *Sentinel*, of July 7th, says: Thomas B. Hosking was crawling into a small coyote hole, such as are often made by tributers while prospecting, when he was jammed by a mass of falling rock and so held until life was extinguished. His partner had just left him only a little while before to go out and get timbers. They tried to dig him out but the caving ground would not permit of it. As fast af they dug the dirt away more dirt fell, and finally suffocated him. When the first attempt was made to relieve him he spoke to those who came to his assistance. He had the chance to say but a few words, however, for the second caving drowned his voice completely and stifled him. Hosking was a member of the Union Guard Company, and was about 28 years old. He leaves a wife and child. He was a quite, industrious young man, and respected by all who knew him.

Microscopical Society Meeting.—The regular meeting of the San Francisco Microscopical Society, Monday evening, was fully attended, and much interest pertained to the proceedings. Vice-President W. Norris occupied the chair. Among the donations to the Society's cabinet were slides of *protococcus nivalis*, the minute alga causing the phenomenon known as "red snow," from C. H. Denison and W. Norris; also, slides of *bacterium termo* and a fungus developed in cocoanut liquor, from Dr. G. M. Sternberg. Mr. Banks announced the death of Col. W. B. Hyde, a regular member of the Society, and spoke in an impressive manner of his worth. Upon motion a statement of his death and of the loss sustained by the Society were entered upon the minutes of the Society. Henry G. Hanks, State Mineralogist, read a paper on "Rusty Gold, and How to Save It," in which he described a series of experiments he had made in the artificial coating of placer gold, for the purpose of determining the action of quicksilver thereon. We give this paper in another column.

There have been three fatalities from yellow fever lately among the Panama canal employees, and seven soldiers have died of the disease at Havana.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

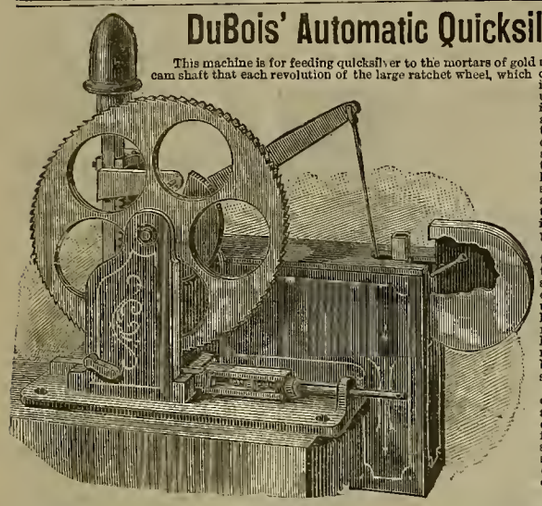
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long, Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Riveta Hand Driven.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

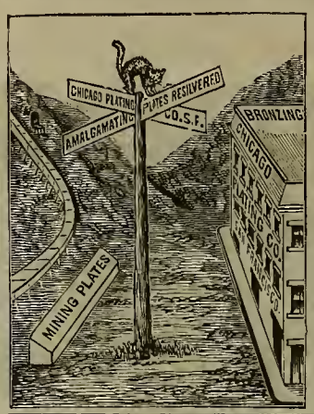
A chief point of excellance of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; i. e., from every one to four minutes.

Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents

22 & 24 Fremont St., San Francisco.

Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.



Amalgamating Plates

REPLATED OR MADE TO ORDER BY THE

CHICAGO PLATING CO.

Pacific Power Building, 23 Stevenson St., S. F.,

And 201 & 203 Randolph St., Chicago.

Having opened a branch house in S. F., the largest Plating and Polishing Establishment on the Pacific Coast, with all the latest improvements in machinery for plating in Gold, Silver and Nickel, with 12 years' experience in the Eastern States and Europe, we claim that our Silver Plated Amalgamating Plates are the most economical, durable, and successful Plates on the Pacific Coast for saving gold. Every description of metal goods plated in the most durable manner by the

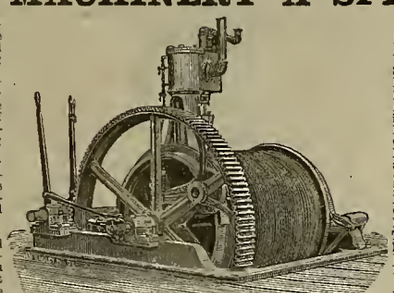
MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupellation Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.



COLORADO IRON WORKS,

P. O. Box, 1921, - - - - Denver, Colorado.

PATENT

LIFE-SAVING RESPIRATOR

Prevents Lead Poisoning and Salivation.

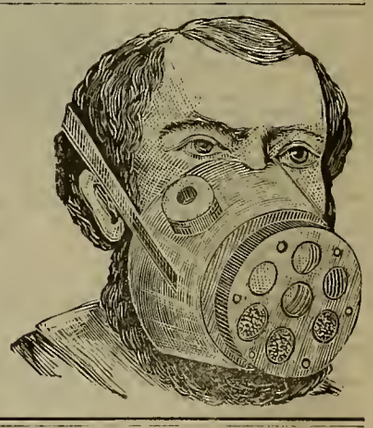
INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price. Address all communications and orders to

SETH MARSHALL, Grand Hotel,

Or C. C. HARVEY,

309 California Street, S. F., Cal

Send for Descriptive Circulars containing testimonials of well-known parties who are at present using them.



Ready for Delivery.

LATHES, DRILLING MACHINES, PLANING MACHINES

and Other Machine Tools,

STRONG, DURABLE AND SUPERIOR TO IMPORTED MACHINES.

Wheel Cutting to Order.

SAN FRANCISCO TOOL CO., - - 21 Stevenson St., S. F.

ESTABLISHED 1868.

GOLD SAVED

BY USING MY

SILVER PLATED AMALGAMATING PLATES.

These Plates are used in Quartz, Gravel and Placer Mining with gratifying success. I am constantly filling orders for them, and when once used they prove themselves so superior to any other process yet discovered for saving Gold that my customers would not do without them. I have the best facilities on this coast for filling orders for these plates, and will guarantee my work. Old Mining Plates Bought, Taken in Exchange for New, or Re-plated.

Pacific Gold, Silver and Nickel Plating Works,

Send for Circular **101 and 103 Geary St., Corner Dupont, San Francisco, Cal.**

W. E. SHEPMAN, Proprietor.

STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequaled strength, toughness and durability.

An invaluable substitute for forgings or cast-iron requiring three-fold strength.

Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.

15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings.

CRANK SHAFTS, SHOES, DIES and GEARING specialties.

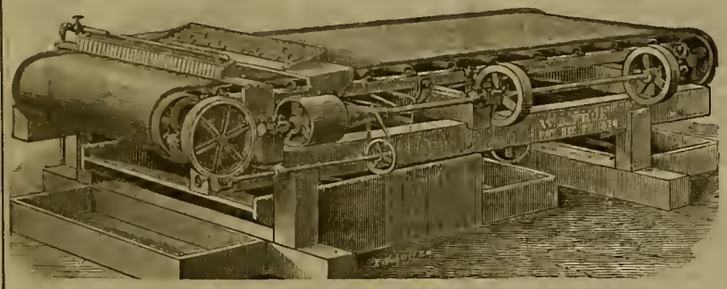
$1,000 CHALLENGE!

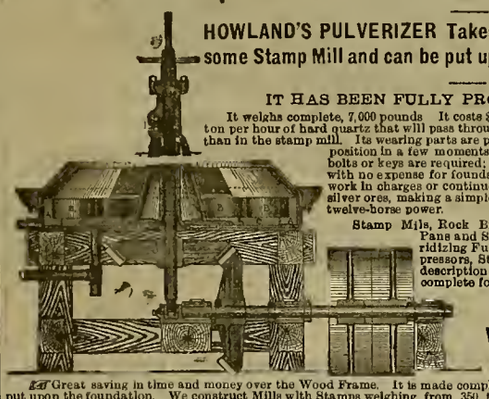


THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.
☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery



HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

New Mining Horse Power.

The demand for a better Horse Power, suited to more general use, has resulted after much experience in the above machine, which we can recommend as a First-class Hoisting Power, under complete control of man tending bucket, through levers connecting with brake and clutch.
This power is light and strong, so that two or more horses can be used for crushing ore or other work.

News in Brief.

Reports from various sections of Virginia represent that not more than half the tobacco crop is planted. Indications are that the crop will be late.

It is estimated that 200,000 sheep in New Mexico have been sold to Texas men this year and driven to that State, and 30,000 wethers have been sold to Nebraska men.

During the fiscal year ending June 30th, there were used by the distillers of Peoria, Illinois, 4,831,568 bushels of grain, producing 18,563,156 proof gallons of spirits.

Stanley continues to explore the Congo. It is said his report to the King of the Belgians will be so favorable that the Congo will be the chief conductor of trade into the center of Africa.

The question of abrogating the treaty of reciprocity with the Sandwich Islands, which the Louisiana sugar interest has tried to have abrogated, has been laid over until the next session.

Mexican advices say that the black smallpox is raging with great violence at Mezatlan, and that Hermosillo and Guyamas are quartining against it. There have been 50 deaths at Mezatlan.

There will be required in the building of the North Pacific's coal bunkers at Tacoma, W. T., more than a million feet of first-class sawed lumber, and the whole cost will be from $75,000 to $100,000.

It is stated on good authority that Governor Stanford intends to put the Alameda county warm springs property in complete repair and to improve it in every way, including the erection of a magnificent hotel.

The Prince of Wales and the Duke of Cambridge will subscribe toward a fund for sending a rifle team to America. The total subscriptions now amount to £542. There will be a final exhaustive test for the selection of the team shortly.

The walls of the foundry for the Judson Manufacturing Company, Oakland, are nearly up to the required hight, and work on the wood work of the other buildings will begin this week. Property is advancing in price in the neighborhood of the factory.

The London *Sportsman* says it is utterly astonished at the action of the Committee of the Amateur Rowing Association in passing resolutions touching the status of the Hilleda e crew, particularly when it sees the names attached to it. It feels with pain, almost degradation, the action of the association in not affording simple justice to the visitors.

The "Chicago City Directory" for 1882, just issued, shows a healthy and encouraging increase in the population of the city. The list of names occupies 70 pages more than were needed last year, representing about 12,000 more names, or 35,000 persons. A rough estimate, founded on the data thus obtained, would fix the population of the city proper at about 580,000.

The corner stone of the Garfield Memorial church, to be built in Washington City, was laid on the 2nd instant, the first anniversary of the President's assassination, with impressive ceremonies. This church is to take the place of that to which President Garfield belonged, and which he attended while in Washington. It is being built by the same congregation with which he associated.

The number of farms in the United States in 1880 was 4,008,907. Of these, 2,984,306 were occupied by owners; 322,357 were rented at a fixed money rental, and 702,244 were rented for shares; 4,352 farms of less than 3 acres; 134,889 above 3 acres and less than 10, and 254,749 between 10 and 20 acres; 781,474 between 20 and 50; 1,032,910 between 50 and 100 acres; 1,695,983 between 100 and 500; 75,972 between 500 and 1,000, and 28,578 were 1,000 acres and upwards in extent.

Gen. Skobeloff's heart complaint, it is thought, was due to a contusion received during the attack on Plevna. His end was without warning. There were, at first, reports of foul play, but examination shows that death was caused by rupture of the vessels of the heart.

The new water works of the Huachuca Co., Tombstone, A. T., are now in complete working order. The main supply comes from natural springs and streams in the Huachuca mountains. Twenty-seven miles of pipe are laid, and the company has facilities for furnishing 1,500,000 gallons daily.

The fire was started in the furnace at the Hotaling iron mine, Placer county, on Monday of last week, and the first draw of iron for this season was made Friday. They have an abundance of ore in sight, about 70,000 bushels of coal on hand, 30,000 cords of wood cut, 26 coal kilns running steadily, which turn out about 4,000 bushels a day.

A Remarkable Furnace Run.—The old Globe Copper Co.'s smelter, located near Globe, in Arizona, recently started up. The first week's run, ending July 6th, was as follows: Ore smelted, 612,100 pounds; bullion yield, 119,549. Making an average ot something more than 43 tons of ore per day put through the smelter, with a daily bullion product of 8¾ tons, running from 97 to 98 fine. This is one of the famous Water Jacket smelters made by Rankin, Brayton & Co., of the Pacific Iron Works of this city, and is only rated by them at 30 tons per day capacity. This is certainly a most remarkable showing, and further runs will be looked for with much interest.

A Rural Commemoration.

One of those pleasant impromptu celebrations, such ae occur naturally in the rural districts without much effort on the part of any one in particular, occurred at Anderson's Springs, on the Fourth. Ex-Supervisor Fay acted ae President; Father Joseph Gallagher, Chaplain; Captain A. C. Freese, Orator; Dr. Roche, Poet; Mies Sarah O'Donnell lead the audience in singing "America;" Mise Louies Freese read the "Declaration of Independence" admirably; Miss Beckie O'Donnell gave a popular recitation. Among other sentiments offered was the following, appropriate to the place of celebration:

LAKE COUNTY,

The grandest health and pleasure ground of California. Its hills are the sublimest; its forest "plumage" the handsomest; its crystal lakes and brooks the purest; its atmosphere the clearest; its skies the fairest and bluest; its starry firmament the most prolific and brilliant; and its patriotic sons and daughters the sturdiest pioneers of all our glorious Yankee nation.

A large number of the guests of the Springs, with neighboring citizens, were present, and it was generally conceded that all duties were well performed. Dr. A. Andereon photographed the procession and the audience as assembled. Many enjoyed the afternoon in strutting about the Springs and the fine natural park in the heart of which they are located. A lively country dance closed at 12 P. M., the rare pleasures of the occasion.

Progressive and Substantial Patent Agency.

The Scientific Press Patent Agency was established in 1850, and has ever since been the leading Patent Agency on this side of the continent. Thousands of patents have been secured through this old and reliable Agency; and, from personal experience, most of the leading inventors of this coast can testify their great satisfaction at the promptness and dispatch with which their business has been put through, and the best patent claims admissible obtained.

There are few solicitors of Patents in the United States who have been so largely, or so continuously and successfully engaged in the soliciting of patents.

As editors and publishers of leading scientific, mechanical and industrial newspapers for the past 20 years on this coast, Dewey & Co. have superior facilities for acquiring and giving information upon all subjects of discovery, whether in the line of the farmer, the miner, the manufacturer, the mechanic or the scientific inventor.

Their files of illustrated, scientific and mechanical publications afford an encyclopædia of useful knowledge pertaining to the development of all branches of business upon this coast for many years past.

Their library of books on home and foreign patent laws; United States and Foreign Patent Office Reports; mechanical, industrial, and scientific text books, encyclopædias, etc., is one of the most complete for reference in patent matters, in the United States outside of Washington.

Here an inventor can secure a knowledge of the State of the art, in any particular class he wishes to investigate and improve in, that will greatly aid him in his work of inventing.

They also mail (free, on receipt of postage stamp) a reliable pamphlet containing valuable information for inventors and patentees.

Geo. H. Strong, W. B. Ewer and A. T. Dewey comprise the firm of Dewey & Co., Patent Solicitors. Their Patent Agency is favorably located and connected with the Mining and Scientific Press and the Pacific Rural Press offices, at No. 252 Market St., S. F., journals that are well known among the ably conducted and widely circulated progressive American weeklies of the day.

Agents Now Wanted.

Extra inducements will be offered for a few active canvassers, who will give their whole attention (for a while at least) to our business. Apply soon, or address this office, giving address, age, experience and reference.

DEWEY & CO., Publishers,

The HARMON SEMINARY will be first-class in all respects, and will combine the best educational advantages with home care, guidance and guardianship.

The first year will open August 3, 1882.

For prospectus and other information, address
S. S. HARMON, Berkeley, Cal.,
Or, E. J. WICKSON, 414 Clay st., S. F.

Sonoma Valley College.

Has the most desirable location and the finest school building on the coast. The climate is warm and healthful. It is free equally from fogs and malaria during the summer. The school is sufficiently removed from the city to preserve regular habits on the part of pupils, and to protect them against contagious diseases. Only the best pupils from the best families are sought. The number of boarding students will be limited positively to twenty, and application for admission must be made in advance. To this limited number of pupils will be secured the best companionship, the best accomodations, the best care and the ablest instruction that can be procured in any first-class school of the East. The Principal is well-known as an educator, being the FOUNDER OF THE BERKELEY GYMNASIUM. He will be supported by a Faculty composed of young men in the prime of life and recognized by the public as successful teachers. Students prepared for any American University. Special attention will also be given to the English and Commercial Department. The next term will begin on

Monday, July 31st.

Registered students can be admitted earlier if desired. For catalogues or particulars, address

ANDERSON'S SPRINGS,

LAKE COUNTY, CAL.

Nineteen miles from Calistoga, Napa county. Five miles from Middleton, and ten miles from the GREAT GEYSERS, between which and Anderson Springs, there are good Wagon Roads.

Hot Sulphur and Steam Baths

For the Cure of Rheumatism, Paralysis, St. Vitus' Dance, Dropsy, Etc. Cold Sulphur for Dyspepsia Diseases of the Stomach and Kidneys.

Scenery Unsurpassed. Climate Mild and Equable.

Consumptives generally improved in health, and asthmatics are invariably relieved. Trout Fishing in the grounds. Deer hunting in the immediate vicinity. New Cottages for the better accommodation of guests. Cooking good.

IMPORTANT RECOMMENDATIONS.

Remarkable Cure of Dropsy.

VALLEJO, June, 1882.

I suffered intensely with dropsy, and was induced by Mr. Edgecomb to try Anderson's Springs, he having been cured there, after undergoing frightful agonies, being tapped three times before he reached there; and I am deeply grateful for taking his advice, for such a beneficial effect had the Springs on me, that I am now entirely cured, and advise all who may be suffering to try Anderson's Springs. KATE MACKAY.

Sight Restored.

A candid and well-known gentlemen of San Francisco certifies briefly as follows:

May 31, 1882.

"I was cured of Inflammation of the eyes at Anderson's Springs, Lake county." M. J. DURNEY, 425 Brannan St., S. F.

Many other cases of Dropsy and Paralysis, Rheumatism, Swelling of Limbs, and various other obstinate cases of chronic diseases have been cured from year to year, at the above-named springs, which are located in Lake county, 19 miles from Calistoga. Special regard is paid to the diet of guests, who are liberally furnished with good home cooking, etc Send for further information. Address

ANDERSON & PATRIQUIN.
Anderson's Springs, Lake Co., - via Calistoga, Cal.

A Song of Nature.

By the gurgling stream as it winds along
On its way to the valley below,
It sounds in my ears like a long lost song
Of childhood's sweet day, long ago.

The smooth worn bowlders, like long-lost friends,
Familiar in times long past,
Stand forth to my view and with my vision blends,
And my youth seems again in my grasp.

Like life's blood a dancing through eager young veins,
The water runs rapidly past,
Portraying this life with its joys and pains;
Returning, no, never, alas!

But here, by this stream, is a treasure more rare,
That will heal all diseases and pain,
Even fountains of life-giving water are there,
Not supplied by the winds nor the rain.

But dear m ther earth, from her bosom supplies
Th se springs that were hid from our sight;
They strengthen our heart and open our eyes,
And fill us with youthful delight.

And even the rocks at this wonderful spot
Breathes soft on our bruises and pain,
Their medical vapor, exceedingly hot,
And this bath'ng is never in vain.

These waters of life and this medical breath,
Are free to the great and the small,
At Anderson's Springs, saving from death
The blind, halt and maimed, one and all.

Unto God be all praise who created the earth
With these blessings so rich unto men,
Who even now slowly are finding their worth,
And do bless him in turn again.

VIGORIT POWDER.

☞ NO ACCIDENT HAS EVER HAPPENED. ☜

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS. ☞ Send for Pamphlet showing methods of testing the different qualities of all Powders.

The Company manufactures

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT, No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." It is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2,
Equal to any correeponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

CALIFORNIA VIGORIT POWDER CO., ENGLISH & WRIGHT, Agents
No 327 Pine St., San Francisco.

Contains no Nitro-Glycerine or Chlorate of Potash, and is the only High Explosive Manufactured in America that does not contain these Dangerous Ingredients.

In Use for Seven Years Without a Single Accident

TONITE POWDER CO.,

No. 310 California Street, - - - SAN FRANCISCO.

EXCURSION
TO ALASKA.

The August trip of the Steamship IDAHO to Alaska will be made a special feature of interest for tourists and pleasure seekers. In addition to her regular ports of call (Wrangel, Sitka, Harrisburg, etc.) it is intended she shall visit Glacier Bay and other points of special interest.

The trip from Puget Sound to Alaska, instead of being, as many imagine, rough and tempestuous, is made nearly the whole distance on inland waters, which are as smooth and unruffled as a mountain lake. The scenery is a magnificent panorama of wondrous grandeur. The noted and celebrated points of interest in California and other States dwarf into insignificance in comparison with the wonderful sights and towering mountains in this wonderland of glaciers, icebergs, Aurora Borealis and nightless day. Only a limited number of passengers can be taken from San Francisco, as a large number of tourists have engaged to go from Portland, Victoria and other northern ports.

Those desiring to engage passage will please register their names at the Company's Ticket Office, 214 Montgomery street. No name accepted unless accompanied by a deposit of $20 on account.

The fare for the round trip has been fixed at a low rate of $115, which includes meals and a berth.

Passengers will take the DAKOTA, which leaves Broadway Wharf July 29th, at 2 P. M., and transfer to the IDAHO at Port Townsend about August 3d, reaching San Francisco on the return about August 25th.

RANKIN, BRAYTON & CO.,
127 First St., San Francisco, Cal.
BUILDERS OF
MINING MACHINERY.

Plants for Gold and Silver Mills, embracing the latest and most improved machinery and processes for base and free ores. Water Jacket Smelting Furnaces for silver, lead and copper ores, with new and important improvements, superior to any other make. Hoisting Works, Pumping Machinery, Chloridizing Furnaces, etc. We offer our customers the best results of thirty years' experience in this special line of work, and are prepared to furnish the most approved character of Mining and Reduction Machinery, superior in design and construction to that of any other make, at the lowest possible prices. We also contract to deliver, in complete running order, Mills, Furnaces, Hoisting Works, etc., in any of the Mining States and Territories. Estimates given on application. Send for illustrated circular.

The undersigned are agents for, and are prepared to furnish prices and all particulars for

THE BALDWIN LOCOMOTIVES, every style and for any service.

THE BALDWIN STEAM MOTOR for use on City and Suburban Roads.

Oscillating Stamp Mill.

It has no Stems, Cams, or Tappets, and adjusts itself to the wear of the Shoes and Dies.

For simplicity, economy, durability and effective working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power. Awarded First Premium and Medal at Mechanics' Fair, S. F., 1880.

Manufactured by

F. A. HUNTINGTON, 220 Fremont St., S. F., Cal. | FRASER & CHALMERS, 145 Fulton St., Chicago, Ill.

Improved Patent Grinding and Amalgamating Pans, Concentrators and Gold Amalgamators; also, Steam Engines and Mining Machinery of all kinds. Send for circulars.

F. A. HUNTINGTON,

220 Fremont Street, San Francisco, Cal.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

Send for Circulars.

SHINGLE MACHINE.

For simplicity, durability and rapidity of action, these Machines have no equal, cutting from 3,000 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

VOLUME XLV Number 4

Improved Winding Gear for Mines.

An English inventur, Mr. John Cravon, uf Wakofield, has lately introduced improvements in the form and arrangement uf winding gear for minos, for the invention of which letters patent have been granted. The improvements oonsist mainly in ohviating the neoessiy for coiling ropes round the drums usually employed, and so removing the danger and expense arising from the great wear and frequent injury of the ropes hy one coil chafing against the other. In order to effect those objects, the inventor employs a single winding rope, an npper set uf grouved headgear pulleys, and a lower set uf grooved winding pulleys, each consisting of two pulleys and an intermediats grooved pulley between the two sets. The rope is attached at une end to one of the cages, passes over one of the headgear pulleys, nnder one of the winding pnlleys (to whioh the motive power is aoplied), and hack over the intermediate pnlley, and then nnder the other winding pnlley, and thence over the other headgear to the other csge, to which tho end of the rope is attsched. This arrangement is designed to give greater durability to the rope, and to ohviate all tendency to slipping of the rope. as in proportion as the weight of the load is increased the adhesion of the rope is augmented. The hearings of the intermediate pnlley may he carried in a movahle frame, either inclined or otherwise, so as to admit of the pnlley heing adjusted as reqnired, in order to maintain the rope tant.

Fig. 1 represents in elevation and Fig. 2 in plan, a winding gear constructed and arranged after the method ahove described. A set of two grooved headgear pulleys is mounted in hearings on the headgear or framework, and another sot of two grooved winding pnlleys is keyed on the crank shaft of the engines in the engine-house. The headgear pnlleys are preferah y set at an inclination inwards towards the winding pulleys in the engine-honse, as shown in the plan. The intermediate grooved pulley is mounted in hearings carried hy the framework. The single winding rope is attached at one end to one of the two cages, and passes over one of the headgear pulleys, thence under one of the winding pulleys in the engine-house, and then hack and over the intermediate pulley, and then under the other winding pulley in the engine-house, and to and uver the other headgear pulley to the other cage, to which the end of the rope is attached. The winding engine is represented in the engraving, and its power is applied to the cranked shaft of the engines, on which the winding pulleys are mounted, so as to drive the pnlleys in the one or the other direction for raising the one cage and lowering the other hy the one rope. The hearings of the intermediate pulley are in hlucks which are capahle uf sliding upon gnides carried hy the framework. To these hlocks are attached the rods represented in the elevation, the other ends of which are screwed and pass through lugs, and are provided with screw nuts. By screwing np or slackening these nuts, the hearings can he moved in one or the other direction to maintain the rope taut, or to slacken or tighten it, as reqnired. The following speciho advantages are claimed for the invention: No chafing of rope as in the ordinary system of drum, so that the ropes last longer; reduction of work for the engine to do in starting; reduction of strain upon the engine, etc., in stopping; speed, instead of heing ohtained hy a large diameter of drum, is got from the engine running quickly; a smaller engine is required than with ordinary gear, owing to the comparative lightness of the winding pulley; the wiuding pnlleys have only one groove each, and are of very small weight comparatively; saving in first cost, the engine-house heing much narrower, and only one rope required instead of two; great adhesion, no slip accurring hetween the rope and the pulleys.

THE United States has bad the misfortune lately to lose, hy death, one of the hest microlithologists in the world, Dr. G. W. Hawes, lately Director of the U. S. Geological Mnsenm at Washington.

Amended Mining Law.

During the present session of Congress, there was very little "tinkering" with the U. S. Mining Laws. While legislation on this subjeot wss pending, we made some comments on the hill introdnced, and have referred tu it several times. Now the hill has heen passed and approved, and the other day the Commissioner of the General Land Office issned the nsnsl "instrnctions" under which is termed the act of April 26, 1866. The law is as follows:

An act to amend section 2326 of the Revised Statutes, in regard to mineral lands, and for other purposes.

Be it enacted, etc., That the adverse claim required by section 2326 of the Revised Statutes may be verified by the oath of any duly authorized agent or attorney-in-fact of the adverse claimant cognizant of the facts stated; and the adverse claimant, if residing, or, at the time, being beyond the limits of the district wherein the claim is situated, may make oath to the adverse claim before the clerk of any court of record of the United States or of the State or Territory where the adverse claimant may then be, or before any notary public of such State or Territory.

SEC. 2. That applicants for mineral patents, if residing beyond the limits of the district wherein the claim is situated, may make any oath or affidavit required for proof of citizenship before the clerk of any court of record, or before any notary public of any State or Territory.

The instructions to Registers and Receivers, issued hy the Commissioner of the General Land Office, are as follows:

GENTLEMEN:—Your attention is directed to the provisions of the following Act of Congress, approved April 26, 1882 (see May Land Gwner, p. 44)

1. It will be observed that the act is not retroactive, and hence cannot effect proceedings had prior to its approval; where citizenship, however, has not been proven, it may be established as provided by Section 2 of this Act.

2. Where an agent or attorney-in-fact verifies the adverse claim, he must distinctly swear that he is such agent or attorney, and accompany his affidavit by proof thereof.

3. The agent or attorney-in fact must make the affidavit in verification of the adverse claim within the land district where the claim is situated.

ON the 13th inst., about 9 o'clock, through some misunderstanding of orders given by the superintendent of the Gold Run hydraulic claim to the night foreman, N. H. White, one of the watchmen, was shot by S. Beers, another watchman. Eight or ten huckshot struck White, one going through the leg, the others inflicting mere flesh wounds.

THE mining companies of Deadwood, D. T., have paid in dividends, during the first six months of 1882, the sum of $535,500.

Academy of Sciences.

The regular semi-monthly meeting uf the California Academy of Sciences was held on Monday evening last, with Dr. Harkness in the chair, in the absence of President and Vice-Presidents. Mr. Chas. Wolcott Brooks presented specimens conglomerate of sea shells, clay or aluminous pehhles, rounded hy action of the waves, pure yellowish clay, oxidized granite, hydraulic limestone, iron ore, all from Pt. Pinos, Monterey; also indurated olay perforated hy pholas, clay pebbles, granite horings taken from an artesisn well 1,002 ft deep at the Hotel del Monte, Monterey oonnty; alsoshell from same locality, a specimen of tripolite. From Dr. W. H. Harkness, specimen of trachyte and calcareous tnfa from heneath the falls uf the Sacramento river; specimen of arbor vitæ from near Mt. Shasta, hy B. B. Redding, also grass.

Fig. 2

ARRANGEMENT OF WINDING GEAR FOR MINES.

Dr. Albert Kellogg described a species of large-sized purple heather hell, fonnd in this State. He also described how Indians made water-tight baskets, with fast-colored patterns woven in, from a species of native grass, the colored parts being taken from the outer covering of a maiden's hair fern, that grows at an altitude of 5,000 to 6,000 ft., and has a comparatively large leaf. Dr. George M. Sternherg, U. S. Army, presented a choice collection of fossil hones of the quarternary period, which he ohtained from an old lake hasin, hetween the Snake and the Colnmhia rivers, in a stratafied, yellow, sandy eoil among dunes overlying hasalt. They included two species of the *equus* or fossil horse, one as large as onr present horse, the other the size of an Indian pony; also, hones and articulations of the llama, all of which were coeval and associated with remains of the *Elephas primigenus* or mammoth. He found evidences that the large llama of that age ranged as far north as Washington Territory. The metacarpal hones of hoth the horse and llama were considerahly larger than any described by Leidy in Whitney's work on auriferous gravels of the Sierra Nevadas and of Merced conty. In the collection presented was a large numher of foseil teeth.

After thie a discnssion ensned on the snhject of cyclones, which was participated in hy Dr. Stout, Dr. Harkness, C. W. Brooks and Mr. Redding.

The Education of Mechanics.

So many of onr systems have heen faulty, and have heen rectified, that people natnrally oome to think everything old and in need of reformation; and thns it happens occasionally that some of onr good old systems are destroyed from onr very attempts to make them hetter. Now some of our wise men, who have done much towsrd making our educationsl system more practical than it formerly was, are advancing ideas of so extremely practical a natnre that it is somewhat douhtful whether from what originally impelled them to good will not result in a monstrous evil.

Some few years ago, when there were no high branches taught in the puhlio schools, the system wss railed against; and now that they are taught, the dissatisfaction seems greater. It is called impractical, for there is said to he a smattering of everything and a thorongh knowledge of nothing. It is considered especially ill adapted to the hoy who intends to become a tradesman. And since a city will require more mechanics thsn men uf any other clsss of lahor, our school system is in had repute.

We are referred to the French. They have organized in all their cities technical schools, and they are producing model workmen. In England they have done likewise, and the resnlt is the same. It is feared that if we du not shortly follow their example we will have no workmen to take the place of the present generation, who have so rapidly advanced our manufactures to the prices they now command in the world's market. We are told that we mnst have work intelligently executed to compete with Fraoce and England, and that if we do not our manufacturing industry will sink into the insignificance from which it so recently sprung.

To avoid the great wave of mechanical ignorance that is advancing npon us, a system of pnhlic instruction is proposed that shall edncate each hoy to a special vocation.

Just as a gardener hss need uf a certain shape and quality of a tree, and trims and tends a yonng one with the certainty that it will grow to he exactly what he wants, so our practical men mean to have workmen in readiness for the vacancies occnrring in the world's workshop.

The practical men ask: What is the nse of a hoy spending time in the stndy of literature or metaphysics or art, when literatnre or metaphysics ur art will he of no earthly good in his work as a mechanic?

But, one can hut wonder, do these men who want to make specialists of public-school-attending hoys, educate their own sons after this theory? Have they not, from their original generosity in seeking edncational reforms for the public, come to he patronizing?

We do want good mechanics; we want intelligent mechanics; hut we want them from choice, and not from compulsion. We want to see hoys have a taste of general edncation, that they may live and die with more than one idea in their heads, and that, one of earning their living. The money-making genius is something, hnt it is not everything.

Let onr public henefactors think—not mechanically, hnt humanly—hefore they change our educational system. Let them turn aside from their calcnlations and theories, from their principles and practices, and go hack to their former selves—when they felt and thought naturally—hefore they were so eminently practical and so exclusively scientific; hefore all their sonl ran into mind; hefore their seeming foolishness developed into their present wisdom.

What is looked upon as superfluons edncation serves a similar purpose to the ornamentation in our homes—we can live without it, hnt such life is not worth living; and will not education grace as well the mechanic as the man who does nothing?

After all, heyond the workman ie the man. Let ns have the man first, the workman afterward.

IN horing a well at Cloverdale, the anger, at a depth of 30 feet, passed through a white pine log, and six inches farther strnck a tree standing on end, and had to cease operations.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

Mining Law Once More.

EDITORS PRESS:—In your issue of July 1st, Mr. Elbert C. Van Blarcom, of Tombstone, complains that in my criticism of the changes which he and Mr. John A. Church wished to see effected in our mining law (as published in the PRESS of June 3d), I had written without sufficient information, and he desired to correct my errors. Strangely enough, however, he does not show that I misquoted or perverted a single suggestion made towards changing our mineral land laws.

His corrections are confined to two points—that he wrote his original letter on mining law at the request of a census agent, and managed to bring it to the notice of a Pacific Coast Senator, who praised the production. This appears to be the sole foundation for the editorial in the *Engineering and Mining Journal*, which states that the suggested changes had been submitted to and approved by men of great legislative influence. Surely Mr. Van Blarcom ought to know that, so far as the mining community is concerned, it is a question of no moment at all whether he was inspired by one man or encouraged by another to dash ahead, or acted entirely on his own judgment, in becoming a mining law-giver. I saw from his published letter that he wanted to have a mineral agent established in each mining district, with the autocratic power to veto every attempt to claim and locate a lode, unless he was in the humor to approve of it and was paid $15 for going on the ground to see the location monuments set up. As I did not like the proposed change, I openly said so.

Mr. Van Blaroom asserts that he did not discuss the subject of end-lines in his former letter. That is quite true. His attention seemed to be more devoted to purse-lines in miners' pockets, than end-lines in mining claims. He alleges that all the prospectors he has talked with are well pleased with his scheme to control mining locations. If so, then I know he has either conversed only with "tender-feet," or has failed to understand how much irony there might be in the answers he received.

It was clear, even to a casual reader of the two letters which appeared in the *Engineering and Mining Journal*, that Mr. Van Blarcom was only to furnish the text, or subject, and Mr. Church was to treat of and amplify it according as circumstances might warrant. The editors of the *Journal* expected a lively discussion, and the pleasure, later on, of issuing a pamphlet, in which all the letters containing anything of value would be printed. But why does not the performance proceed? No one openly supports Mr. Church in his plan to make the prospector forfeit his claim if a patent is not applied for within one year after it is discovered. He proposed, by laying heavier money burdens on prospectors than they could possibly bear, to banish them from our mineral States and Territories. Why is not the material for the coming pamphlet laid before the public? I was hoping to see a little circus play, and intended to give a few cuts with an independent whip. Mr. Van Blarcom skipped lightly into the ring, and, after standing gracefully on his head for a second or two, introduced Prof. Church, who seemed confident that he could bestride half a dozen mineral-vein horses all at once. But I fear the show is at an end, and this pouting epistle from W. Van Blarcom is his farewell bow to the interested audience.

In the epistle aforesaid, its writer insinuates that I was "afraid" to write in my own name. I am not aware of ever having seen Mr. Church or Mr. Van Blarcom, and hence I do not know what terrible looking ogres they may be. Having lived some 20 years on the coast, I am not very easily scared.

I never heard of Mr. Van Blarcom until he appeared as a mining-law reformer. I know Mr. Church only through the dress he appears in before the public as a writer. He had a newspaper war, recently, with Prof. Blake of New Haven, about expert testimony in the Tombstone and Way Up mining conflict. In that correspondence he made such uncharitable and severe charges against his opponent that I ceased to think favorably of him. If, in criticising his mining-law proposals, I could not conceal my contempt for his mode of publicly attacking a professional adversary, I am sorry for the fact. I can have no personal spite against a man personally unknown to me, and with whom I have never had any business transactions.

Whatever I have learned about the law suits Mr. Church has had to do with, has been through local and mining journals. Though living in the same county, I am many miles away from Tombstone, and never was there but once, more than two years ago. I had only one object in view when I wrote my previous letter to the PRESS, and that was to thwart Messrs. Church and Van Blaroom's schemes for the overthrow of mining prospectors. I rightfully signed myself "A Prospector." Whether I am an African or a Caucasian has nothing to do with the subject under consideration, nor does it matter whether my name is Bill Jones or Von Bismarck.

Mining contests are due mainly to four causes: 1. Many prospectors are poorly educated, and failing to describe their claims properly, they or their grantees who purchase their defective titles without correcting them, get into trouble at later dates. 2. The impossibility of tracing out mineral lodes on the surface when there is no prominent outcrop, and a consequent neglect to make the end lines cut the lode at right angles to its course. 3. The readiness with which lawyers will take cases, when they know that law and justice are against them. 4. The certainty of getting experts to testify on either side in any and every case that comes into court.

The above evils cannot be done away with merely by changing our present mineral laws.

A PROSPECTOR.

Cochise County, Arizona, July 7, 1882.

CURIOUS FORMATION.—In the course of an article describing the Garden Valley and Kelsey districts, in El Dorado county, the Georgetown *Gazette* speaks as follows of the Cambria lode, a half mile south of Garden Valley, and owned by N. H. Wilcox and H. Teague, two practical miners. They discovered this lode last winter. It is really a curiosity, and well worth a careful examination by quartz men. They are down 50 ft. on the east wall, and run a crosscut 33 ft. to the west, and are not through the ledge yet. They have also run quite a drift along the ledge. The material is what is termed stratified porphyry—a network of quartz seams among porphyry, talc, etc., which, strange as it may appear, shows prospects of free gold all through the various formation. We took the pains to prospect a few pans from various parts of the mine, and feel satisfied that the mine is a valuable property. Much of the gold is of the coarse order, showing $15, $20 and $80 prospects. The owners feel sanguine that the ledge will average $10 per ton. We will not venture to give the value the owners place upon the mine, but it is enough to say they believe that it is one of the most valuable mining properties in the State. No blasting has yet been done, the material working very well with the pick. A shaft on the lode some 100 ft. from this shows about the same prospects. The complexion of this monster ledge may not meet the favor of many quartz men, but it pans out, is extensive, cheaply extracted and easily crushed, and what more can a man ask?

A MINER'S REWARD.—The medal which the San Francisco Stock and Exchange Board will present to Van Dusen, the gallant Alta miner, has been completed and delivered to the Board by the manufacturers—Shreve & Co. It is a magnificent piece of work. It is of large size and of the best quality and workmanship. The obverse bears the inscription, in black enamel: "Greater love hath no man than this, that a man lay down his life for his friends." The inscription is surrounded by a wreath of oak leaves, and beneath it are pick and shovel crossed. Upon the reverse are the following words, surrounded with laurel: "San Francisco Stock and Exchange Board to A. Van Dusen, as a testimony of their high appreciation of his heroic efforts to save his comrades in the Alta drift, Gold Hill, Nevada, June 2, 1882." The medal is attached to a massive and handsome gold bar, and is inclosed in a blue morocco and velvet case.

MACKEY IN THE LOWER LEVELS.—John W. Mackey yesterday afternoon took a trip through the lower levels in company with Superintendent Patton, going down the Union shaft and coming out through the C. and C. shaft. Although he only arrived here night before last at 12 o'clock, and though it has been about one year and a half since he was underground, he was in the lower levels nearly all the afternoon, and came out looking as fresh as though he had spent the time on the surface seated in an easy chair in the shade. He found a great many new highways and byways in the underground regions, for a vast deal of work has been done on the lower levels of all the north end mines since he last passed through them. He seems well pleased with the outlook.—*Enterprise.*

A PROMISING INVENTION.—The Reno *Journal* says: It was feared that if a pick-point or broken bit of a drill got into Kinkead's grinder, it would play smash with the apparatus. A piece of steel was in the quartz it was grinding, but did no harm. It was heard rattling around in the central cavity, where the corrugated iron faces crack the rock, so that it can get between the disks and be pulverized, and the machine was immediately stopped and the steel removed without trouble or injury. So, that great objection to the new grinder is disposed of. This machine is proving to be one of the handiest and cheapest and effective mills ever devised.

A NEW YORK mining paper prints an item that the Superintendent of a certain mine telegraphed to the home office that the bottom of the shaft had been reached. Whenever the bottom of a shaft in a mine is reached, that mine may be pronounced a success. You can never pay dividends from a mine till you have found the bottom of your shaft.

IN the last shipment of second-class ore from the Overland mine, Idaho, there was an average of $13 in gold. This is something entirely new in Wood River ores. The mine is reported as looking splendid.

Forest Trees of California.*

The Redwood.

"For they sing to my heart,
And it sings to them evermore."—*J. P. Lowell.*

Towering redwood trees of most enormous proportions sentineled our entrance of the Golden Gate in 1849. Alas! what wits it now to us whether they saw the vandals or the vandals them? Lofty landmarks, objects of intense interest, this great colossal and characteristic evergreen of the California coast! Bold, nay, awe-inspiring, grand and imposing, herculean pillars of the heavens, from out whose blue vault they looked abroad o'er land and sea, high above the hilltops beyond the bay.

Of the same genus as the giant Washington cypress, of world-renowned fame, of nearly equal hight—200 to 300 ft., 15 to 20 ft. in diameter (rarely more), and usually 75 to 100 ft. or more of clean trunk, only second to Sequoia of Sierra—attains to thousands of years of age; and, what is even more marvelous, these monstrous stumps still maintain their vitality. Trees of all sizes and to the extremest age, when cut down, forthwith shoot up unnumbered saplings of great vigor and exceeding rapidity of growth; continued repetition at brief intervals only can kill them. The numerous branches are small and very short; indeed, relative to the size of the trunk, in age, quite insignificant; as it were, mere appendages. So intently devoted are they to the all-absorbing timber producing purpose of their great sylvan colossus, this enables them to close their ranks and crowd the land with an immense amount of timber per acre, absolutely unparalleled.

Occasionally, when a social circle of these young saplings spring from the parent root, say within the usual area of 15 to 30 ft. or so, renewing their youth in such close proximity, two or more may unite to form one large tree. Dr. Wm. P. Gibbons, J. Muir, myself and others, have often seen the forested Philemon and Baucis in lasting embrace, typically transmigrated, beneficent and happy still. Redwood foliage is like yew; the same flat and final starry spray or twiglets of small leaves, say one-half to one inch long, distinctly in two rows, flat, line-like, with a sharp point, dark green above, though not so shiningly varnished; underside soft grayish sea-green; tipped with young spring growth of bright vivid yellow-green, then for beauty, they far surpass the gayest flowers and the prettiest ferns. More or less mixed with the common foliage, are leaves reduced to scales; indeed, some trees are found in every grove with awl-pointed, scaly leaves, like the foliage of the Great Sequoia; but among the redwoods these are exceptional and somewhat rare. The garland-like limbs are chiefly spreading, save in great age, or tipped and drooping with male flowers like the Mammoth King, or pending tiny terminal cones of an oblong shape, one to one and one-fourth inches long and one-half to three-fourths of an inch thick, consisting of numerous trapezoidal disked scales, thickly and roughly implaited by the indrawn or quilted-like center; its very sharp prickly point turned forwards or pressed down and looking outwards; the shield-like disk more or less distinctly marked by a sharp laterally transverse ridge, stem of the scale stout, persisting, compressed, broadly-wedged form with some sharp angles, covered and stained by a dark purple, almost black, shining, fragile and granular secretion, like gum catechu. Seeds, three to five to each scale, flat, oval, or obovate in outline, lateral wings very narrow or slightly and often obliquely margined, color dark reddish-brown, only a little notch'd at the outer and larger end, and shaped like parsnip or other similar seeds.

Redwoods abound chiefly, if not entirely, on sandstone soil—light, loose, black or ashy—and always in the track, and confined to the fog limits of the coast, say 15 to 30 miles inland, and probably never exceed 40 or 50 miles, even in the most favorable low coast ranges where the fog passes over low lands or through open gaps. These mighty, majestic redwood wands possess a magic power over passing fogs, wontedly precipitating them in showers of rain at their feet—for this, mainly, among many other good reasons, living springs of the purest water ever bubble and babble at their bidding—choice guards, as they undoubtedly are, stationed around springs and water supplies, they are, for this very reason, all the poorer roadside or more intimate rural companions. The continual timber supply capacity of a redwood forest, under judicious care, is so prodigous as to be simply incalculable; none but a suicidal and utterly abandoned infanticidal policy, wantonly and untiringly practiced, can ever blot them out.

The timber is red, with a faint coppery or metallic irridescent gloss. Choice curl-grained wood is very ornamental for cabinet finishing and similar work—takes a fine polish, simply stained or varnished, it is far preferable to any paint; the hues deepen to richer darker shades with age. Well-matured heart-wood of the base of these trees is so solid and heavy as to sink in water, *i. e.*, for a few saw-log "first cuts," as the log-men express it; these will last for ages, under the most trying circumstances, like cedars and yews. The upper part of the same tree, on the contrary, is soft, exceedingly light, though of like fine grain, only more brittle, but insects seem never to trouble any of it. It is a great, and certainly too common error, to choose timber by name rather than by selecting the proper quality. During our earthquake experiences we had occasion to examine many walls, all alike laid upon redwood plank, in the lower made portion of the San Francisco city front. Some foundations, of just the same age, were apparently nearly as perishable as poplar, while others were as solid as so much cypress or cedar. Seasoning alone, important as that is, like age for wine, will never make the originally poor good. Probably, from a fair estimate of the redwood forests along our coast, it would not comprise much more than about 3,000 square miles of timbered land. The already extinct and too scattered portions are ignored in this estimate. This Coast range timber belt extends from the northern portion of the State south to San Luis Obispo. Access to tide water, great economic value and universal use, have altogether doomed these mammoth cedars to a speedy destruction.

The bark, reduced to bast, has been utilized for upholstering—an excellent material. The woodman covers his corduroy swamp passes and bridges with this very superior and imperishable material.—*Dr. Kellogg's Forest Trees of California.*

Satin-Tassel Tree.

(*Garrya elliptica.*)

"The mind—that ocean where each kind
Doth straight its own resemblance find."—*Marvel.*

A large evergreen shrub or tree, 8 to 15 or 20 ft. high, three inches to a foot or more in diameter. The most notable for size lately grew near San Francisco, at the San Bruno mountains, having five principal branches, each five to six inches in diameter, from a short main body about one and one-half feet in diameter—surpassing any oak trees of the vicinity. This tree, indeed, bears some casual resemblance to the field live oak (*Q. agrifolia*); but the satin-tassel tree has opposite, entire leaves, *i. e.*, without teeth or lobes. On the contrary, most oaks have saw teeth, frequently more or less deeply cleft or bayed leaves—always alternate. This has the twigs also somewhat four-angled. Of course, if the fruit of the female tree is observed, it is found in clusters of tiny little grapy bunches of purple bladdery-like berries, more or less silky, which stain your fingers purple on pinching them, even though dry and crispy skinned outside. Then to you, this tree is no longer doubtful, and as the fascicles of stiff tags—one to three inches long—fruits, or relics of some one remain on all the year round, they never lack a present manifest witness of their identity. The leaves of both male and female trees are alike elliptical, base rounded, mostly sharp pointed; margins wavy-bent, dark green and smooth above; whitish, with short wool beneath, one and a half to two inches long, about an inch or so broad; nevertheless, many details must needs be omitted. So, only the aided and quickened eye of the observer seizes some relatively strong points that distinguish them and passes on. Confronted with the masculine tree, which promptly steps to the front rank of sylvan beauty, when in winter or early spring his partner's modesty makes but humble display, behold the long satiny tags, five to eight inches in length, pendant in parallel plumb lines on the tranquil air of calm days, or early dawn, like little lambs' tails on the lawn—air of the honest and upright, even to the last jot; in perfect keeping with rectitude to the extremest frankness and candor of innocence. In a word, these tags, or catkins, are the most sensitive, softest and most flexile satiny pearls, strung with living lines, ever hung on emerald mantle. From out the vast empyrean of love, significance to landscape art, to painter, or to poet, ruralist or sage, higher and highest, is ever begotten, reared in wisdom, registered on all these—His works. To us, this tassel tree mingles with the rugged and sturdy, sober and serious, somewhat of the pretty and the playful. Return with us again; view it as stirred by the breeze; now, those long, limsy tags in their rollicking, giddy motions will surely remind you, in their perfect abandon, of those wanton lamb's tails—when the lambs themselves were wont to play "tag" on the sunny old barn floor of a gay spring morn, in the days when you were young; or witness the like joyous lines and big successive drops leap out of the cascade, arching airy diamonds aloft with an extra touch and toss of freedom, grace and beauty, high above and beyond, aerating the choicest gems of the fountain; or, have we in all serenity of delight, seen the lambs cascading, tail and all, in a similar way? then tell us if they do not run together in parallel lines of a just similitude adown to the great ocean of truth.

The wood appears to be exceedingly hard and tough, but we have no knowledge of its applied use. As a tonic and febrifuge it is scarce at all inferior to Peruvian barks. Of the *Garryas* we have about half a dozen species, of which this is, perhaps, the best type. Ere long we trust they will be duly appreciated, for ornament, for medicine, and for other uses.

CHINESE IMMIGRANTS.—Since January 1st, 1882, to date, and including the Chinese who arrived Tuesday, the following were the arrivals by months: January, 1,373; February, 3,542; March, 3,840; April, 2,762; May, 5,176; June, 4,667; July, 2,135; total, 23,495. The vessels which brought this horde of Chinese to this city numbered 20. The *Gaelic*, in 3 trips, brought 2,595; the *City of Tokio*, in 2, 2,211; the *Belgic*, in 3, 1,175; the *Oceanic*, in 2, 2,199; and the *Anjer Head*, in 2, 1,590. It is stated that the fine of Captain Fenwick, of the British steamer *Strathairly*, for overcrowding his vessel, has been reduced to $10,500.

*From "The Forest Trees of California," by A. Kellogg; published by the State Mining Bureau. State Printing Office, Sacramento, 1882.

MECHANICAL PROGRESS.

The Mechanic Arts.

The mechanic arts—particularly in the United States, where they are most diffused and all but universal—appear to contribute more directly than any others to the general comfort and improvement of the people. All others are dependent upon them for the principal agents and instruments of their success. They are scarcely more subservient to the primary wants of mankind than to the higher ministrations of taste and refinement. The acquisition and diffusion of knowledge, the means of intercommunication and transportation, the comforts, enjoyments and security of the fireside, and even the honor and integrity of the nation itself, are dependent upon the skill and enterprise of the manufacturer and the mechanic; but the results of their labor are, from their nature, less obtrusive or obvious to the general apprehension than some others. The annual movements of our immense crops of grain, cotton and other bulky staples, are easily appreciated. The pulsations of commerce may be counted by a superficial observer, in the arrival and departure of ships, and upon the records of the Custom House and the Exchange; but in the hands of the manufacturer, a modicum of crude material undergoes a process of division, transformation and elaboration, and then silently and unobtrusively disappears—diminished in bulk, but augmented, it may be, many hundred-fold in value—in the ordinary channels of distribution, where it is often undistinguished from its foreign rival. It is only when the nation takes account of stock that any approximate idea is obtained of the value of this item in the general account.

And who can justly estimate the influence upon the general happiness and prosperity—upon the progress in civilization of the sum total of effective labor, capital and skill represented in the development of the mechanic arts in this country? What an amount of fixed capital—of labor, enterprise, ingenuity; of resources, material and immaterial—is there involved in the manufactures of a single year? The increased support given to agriculture, commerce and the mining interests of the consumption of hundreds of millions of dollars' worth of raw material, and to hundreds of thousands of men, women and children, who would have been otherwise unemployed, or forced into competition with the farmer and planter, instead of being consumers of their produce, form but a part of the benefits conferred upon the community at large. The independence and security contributed by manufacturers and mechanics, whether of supply or defense, to a nation, cannot be overestimated.

It is a gratifying fact, shown by the official statistics, that while our older communities have greatly extended their manufactures, the younger and more purely agricultural States, even the newest Territories, have also made rapid progress. Nor has this department of American industry been cultivated at the expense of any other. There is much reason to believe that it affords the safest guaranty of the permanency and success of every other branch. Evidence bearing upon this point is found in the manufacture of agricultural machines and implements, which is an industry that annually enlarges its operations. There is little doubt that the province of manufactures and invention has been rather to create than to follow the demand. The promptness of Americans to adopt labor-saving appliances, and the vast areas devoted to grain and other staples in the United States, have developed the mechanics of agriculture to an extent and perfection elsewhere unequalled. The adoption of machinery to the extent now common in farm and plantation labor furnishes the best assurance that the development of agriculture or manufactures to their utmost can never again justify the old charge of antagonism between them in regard to labor, or injuriously affect either by modifying its cost or supply.—*The Economist.*

COPPER BEARINGS.—Mr. A. Getchell, of Boston, Mass., claims that he can harden copper and convert it into anti-frictional metal by the following process: The copper is first heated to about redness in a crucible, and a composition is then added which, for 25 lbs of copper, consists of 1¼ lbs of potash or soda, 1 lb of alum, ¼ lb bone dust or other phosphate, and ¼ lb of tin or zinc. After melting this mixture of copper and composition, and removing the slag, the whole is ready to pour, and may be run into molds. After having removed the slag, and while pouring, the metal should be covered with charcoal to prevent oxidation. The resulting metal is said to be especially useful for bearings in machinery.

NEW RESISTING ALLOY.—Experiments lately made at Leipsic with a cuirass made of a steel, the formula of which is kept secret, have given very remarkable results, which would seem to indicate that the new material combines both tenacity and ductility in the highest degree. The steel plate of the cuirass is only .06 inch thick and lined inside with a layer of wool. Of 11 rounds from a Martini breech-loading rifle, fired at a distance of 175 yards, only two of the bullets pierced the metal, and even these were completely flattened and stuck in the lining, so that the supposititious wearer would have remained uninjured.

Improved Mining Gear for Mines.

Important improvements have been introduced by Mr. John Craven, of Wakefield, England, in the form and arrangement of winding gear for mines, the improvement consisting mainly in obviating the necessity of coiling ropes round the drums usually employed, and so removing the danger and expense arising from the great wear and frequent injury of the ropes by one coil chafing against the other. In order to effect these objects, the inventor employs a single winding rope, an upper set of grooved headgear pulleys, and a lower set of grooved winding pulleys, each consisting of two pulleys and an intermediate grooved pulley between the two sets. The rope is attached at one end to one of the cages, passes over one of the headgear pulleys, under one of the winding pulleys (to which the motive power is applied), and back over the intermediate pulley, and then under the other winding pulley, and thence over the other headgear to the other cage, to which the end of the rope is attached. This arrangement is designed to give greater durability to the rope, and to obviate all tendency to slipping, as in proportion as the weight of the load is increased the adhesion of the rope is augmented. The bearings of the intermediate pulley may be carried in a movable frame, either inclined or otherwise, so as to admit of the pulley being adjusted as required, in order to maintain the rope taut.

The following specific advantages are claimed for the invention: No chafing of rope as in the ordinary system of drum, so that the ropes last longer; reduction of work for the engine to do in starting; reduction of strain upon the engine, etc., in stopping; speed, instead of being obtained by a large diameter of drum, is got from the engine running quickly; a smaller engine is required than with ordinary gear, owing to the comparative lightness of the winding pulley; the winding pulleys have only one groove each, and are of very small weight, comparatively; saving in first cost, the engine-house being much narrower, and only one rope required instead of two; great adhesion, no slip occurring between the rope and the pulley.

A NEW WATER ELEVATOR.—Among the many interesting exhibits at the recent Naval and Submarine exhibition, in England, was a new water elevator, by means of which, it is stated, from 300 to 375 gallons of water can be raised per minute, the consumption of fuel being from 8 to 10 cwt. of slack per day, and the discharge pipe being six inches in diameter. The apparatus consists of a cylindrical chamber furnished at the lower end with inlet and outlet valves for water, and at the upper end with an inlet valve for air, while, in addition, there is a small steam valve which is opened periodically for a brief interval by a rotating cam driven in any convenient way. It is filled by gravity, and, when steam is admitted, the inclosed water is forced through the delivery pipe. Partial condensation of the steam then takes place, and a fresh charge of water is taken in, while, at the same time, air enters through the air-inlet valve, the air so admitted appearing to form a kind of cushion between the water and the steam, and appearing to prevent condensation of the latter during the greater part of the delivery stroke. The entire arrangement is characterized by great simplicity, and further improvements which, it is said, will shortly be made, will render the apparatus still more economical and efficient.

THE HOLDING POWER OF BRASS TUBES IN TUBE PLATES.—A number of experiments made by Mr. W. H. Shock, U. S. N., on the holding power of brass tubes in tube plates, have given results worthy of attention. Forty-eight experimente were made with brass tubes, nine inches area in cross section, tubes with screwed ends, having a sectional area of 1.33 inches. The average resistances obtained with each method of tube fixing before the tubes were withdrawn from the plate was as follows: No. 1, tubes simply tightened with the expander, 6,700 lbs.; No. 2, expanded and headed over, 16,829 lbs; No. 3, expanded, ferruled and headed over, 31,751 lbs.; No. 4, expanded, and ends screwed into ¾-inch nuts, 25,212 lbs.; No. 5, expanded, and ends screwed into ¾-inch nuts and ferruled in addition, 39,935 lbs. In 75% of the tests, the plate representing the tube plate was ¾ inch thick, and the rest ⅝ inch and ½ inch thick. It appears, then, that where the tubes were headed over and ferruled, the variations of thickness of tube plate from ⅝ to ¾ inch did not increase the holding power. The holding power of tubes simply fixed by the expander, and neither headed over nor ferruled, is generally very much beyond any strain that would be put upon them by the working pressure of a locomotive boiler.

INSTANTANEOUS FORMATION OF STEAM.—Messrs. Serpollet, Freres & Co., of Paris, have patented an invention for the instantaneous formation of steam, which permits of its use at once in the cylinder of the engine. A pump sends the required quantity of liquid between two plate surfaces, which are heated, and between which there is only a capillary space. The liquid spreading in a thin layer evaporates at once, without going into the so-called spheroidal state; and this steam acts in the cylinder as fresh formed steam. The speed of the pump is regulated by the engine, the pump being connected with the shaft of the engine.

SCIENTIFIC PROGRESS.

The Royal Society of London.

We have only to turn over the pages of its transactions to discern how much this society has done for the progress of humanity. It was incorporated in 1662, and has interested itself in all the great scientific movements and discoveries that have since been made. It published Newton's "Principia;" it promoted Halley's voyage, the first scientific expedition undertaken by any government; it made experiments on the transfusion of blood, and accepted Harvey's discovery of the circulation. The encouragement it gave to inoculation led Queen Caroline to beg six condemned criminals for experiment, and then to submit her own children to that operation. Through its encouragement Bradley accomplished his great discovery, the aberration of the fixed stars, and that of the nutation of the earth's axis; to these two discoveries, Delambre says, we owe the exactness of modern astronomy. It promoted the improvement of the thermometer, the measure of temperature, and in Harrison's watch, the chronometer, the measure of time. Through it the Gregorian calendar was introduced into England, in 1752, against a violent religious opposition. Some of its members were pursued through the streets by an ignorant and infuriated mob, who believed it had robbed them of 11 days of their lives; it was found necessary to conceal the name of Father Walmesley, a learned Jesuit, who had taken a deep interest in the matter; and, Bradley happening to die during the commotion, it was declared that he had suffered a judgment from heaven for his crime.

If I were to attempt to do justice to the merits of this great society, I should have to devote many pages to such subjects as the achromatic telescope of Dollond; the dividing engine of Ramsden, which first gave precision to astronomical observations; the measurement of a degree on the earth's surface by Mason and Dixon; the expeditions of Cook, in connection with the transit of Venus; his circumnavigation of the earth; his proof that scurvy, the curse of a long sea voyage, may be avoided by the use of vegetable substances; the polar expeditions; the determination of the density of the earth by Maskelyne's experiments at Schehallion, and by those of Cavendish.—*Prof. Draper.*

The Wonders of an Atom.

All things visible around us are aggregations of atoms. From particles of dust, which under the microscope could scarcely be distinguished one from the other, are all the varied forms of nature created. This grain of dust, this particle of sand, has strange properties and powers. Science has discovered some, but still more truths are hidden within this irregular molecule of matter which we now survey, than even philosophy dares dream of. How strangely it obeys the impulse of heat—mysterious are the influences of light upon it—electricity wonderfully excites it—and still more curious is the manner in which it obeys the magic of chemical force.

These are phenomena which we have seen; we know them and we can reproduce them at our pleasure. We have advanced a little way into the secrets of nature, and from the spot we have gained we look forward with a vision somewhat brightened by our task; but we discover so much yet unknown, that we learn another truth—our vast ignorance of many things relating to this little grain of dust. It gathers around itself still other particles; they cling together, and each acting upon every other one, and all of them arranging themselves around the little center, according to some law, a beautiful crystal results, the geometric perfection of its form being a source of admiration. It quickens with yet undiscovered energies; it moves with life; dust and vital force combine; blood and bone, nerve and muscle result from the combination. Forces which we cannot, by the utmost refinements of our philosophy, object, direct the whole, and from the same dust which formed the rock and grew in the tree, is produced a living and a breathing thing, capable of receiving a divine illumination, of hearing in its new state the gladness and the glory of a soul.

Crystallization of Metals by Heat.

Some interesting facts regarding the influence of heat on the molecular structure of zinc are given in a recent paper by Herr Kalischer to the Berlin Chemical Society. Rolled zinc becomes crystalline when strongly heated, and the author recommends, as a lecture experiment, dipping a heated strip of zinc for half a minute in concentrated sulphate of copper solution, then washing off the precipitated copper with water, whereupon distinct signs of crystallization appear. The effect is not merely superficial; plates 1-20 mm. to 5 mm. thick (no thicker were tried) proved crystalline throughout. The mode of cooling (quick or slow) has no marked influence. Zinc, when heated, loses its ring, and, if bent, gives a sound like the "cry" of tin; this fact, with the crystallization, confirms the view that the cry of tin is also due to crystalline structure. Zinc must be heated over 150° C. to show crystallization on corrosion, but the "cry" is perceptible at about 130°, and increases with the temperature. As the tenacity of rolled zinc diminishes with crystallization, and the cry undoubtedly proves incipient crystallization, some important deductions for technical work are indicated. Herr Kalischer finds the ratio of the specific gravity of zinc in crystalline to that in ordinary state is 1.0004; 1, or an increase for the former of about .04%. The ratio of electric resistance of zinc wire ordinary to crystalline equals 1.0302; 1, or a decrease for the latter of about 3%. Herr Kalischer was unable to prove so fully crystallization in copper, brass, iron and aluminum, but there were indications of it in some of these.

Spontaneous Combustion in Process of Drying.

A recent fire on the premises of William S. Slater, in Rhode Island, which did some injury to his mills, brings into conspicuous notice the spontaneous combustion of yarn dyed certain colors, while not fully recovered from the operation of the dry-room. The statement is made by Edward Atkinson that during the past four years the several mutual companies of New England have suffered a loss of more than $300,000 from spontaneous combustion of dyed cotton goods in dry-houses or finishing departments. Some heavy losses have occurred from this cause where aniline, cutch, logwood, iron and other common substances have been used for dyeing, without the use of oil of any kind.

There are several colors produced in calico print works and dye-houses which are sources of danger from combustion. They are the colors developed, after the materials have been applied to the cloth or yarn, by chemical reactions in the tissues, with the production of heat, and also by the aid of heat applied to the fabrics in the aging boxes and chambers. Spontaneous combustion in black, brown, slate and pearl-dyed woven fabrics and yarn is frequent. The conditions under which fires have occurred, seem to have been where cloth or yarn recently dyed or dried over dyeing cans, has been rolled or piled hot or slightly damp, either of which conditions are hazardous as regards spontaneous combustion.

Some time since Edward Atkinson suggested the following precautions to be observed by members of the company of which he is President: Provision should be made for a thorough cooling and drying of the fabrics before folding, rolling or piling in bunches; dyed fabrics must not be allowed to remain in compact masses in an unfinished state over night; but have them starched, cooled and finished as quickly as possible; dyed goods or yarn should not be piled in large quantities, but spread over a sufficient surface to permit them to cool readily; a suitable place of deposit, as nearly fire-proof as it can be made, should be provided for keeping goods over night that are liable to spontaneous combustion, if such keeping cannot be avoided.—*Manufacturer and Builder.*

Prof. Proctor on Astrology and Superstition.

Prof. Proctor, in his lecture on astrology at Boston, said that astrology was by no means "a contemptible superstition." "On the contrary," said he, "I think that of all the errors into which men have fallen in their desire to penetrate into futurity, astrology is the most respectable; I may even say the most reasonable. No other method of divination of which I have ever heard seems worthy to be mentioned in company with astrology, which, though erroneous, had a foundation in thoughts well worthy of consideration." He explained many of the rules of the old astrologers, and their methods of calculation. After considering several curious illustrations of the apparent fulfillment of predictions, astrological and otherwise, the lecturer showed how these cases and the influence they exert illustrate Bacon's statement that "men mark when they hit, but never mark when they miss." In conclusion, he congratulated his hearers on the fact that the science of our time is not employed, as was the science of old days, to spread superstitious beliefs or observances. "I forbear from inquiring here," he said, "how much of what was taught by the old astrologers and wonder-workers of Chaldæa and Egypt to strengthen their position among an ignorant and superstitious people has come down even to our own day, and not only in matters regarded as superstitious, but in some still held in reverence by many millions of men. I simply say it is well for mankind that the men of science of our day—especially those most maligned for their outspokenness—are honest. Were they leagued to deceive the world by wonder-working, their task would be an easy one. To undeceive the world would be much more difficult, for 99 out of 100 want to be deceived.

ARTIFICIAL SOIL.—M. Dudouy, of Saint Ouen, has been very successful in chemical horticulture. In his garden he has cultivated legumes, flowers and trees in parallel rows in 3 manners: 1, with ordinary manures; 2, with chemical manures in garden soil; 3, with a special compound, which he calls *floral*, in pure sand. The results of the third experiments have been very striking, yielding the earliest, the largest, and the most delicate vegetables, as well as the most thrifty and brilliant flowers. The *floral* contains nitrogen, phosphoric acid, potash, magnesia and sulphur, in a form so concentrated as to require dilution with 20,000 times their volume of water. The experiments have been continued for 5 years, with uniform success.—*Les Mondes.*

The Mining Share Market.

Mining stocks have shown no special activity this week. Our stock tables in another column show what the slight fluctnations have been. The *Enterprise* says: Stocks are again down, and the market very dull. The smash-up of the pnmping machinery at the Alta has no douht had a bad effect along the whole line. Of late we appear to have got into a bad streak. As soon as things hegin to look a little encouraging in one plsce, something occurs in another to "reduce the average."

Luckily, however, all goes well at the north end mines. The indications are now favorahle for finding a good deposit of ore in winze No. 1, going down from the 2700 level of the Mexicsn. The winze is now down 50 ft., and the ore in the main hody continues almost vertical. This change in the dip is a very favorahle indication. It is prohahle that they are now near a point where the whole vein (which has all along been going off too flat) will be found to straighten np. At the north side the ore now reaches across the hottom of the winze.

At the Union Con., the raise from the 2700 level is going up through streaks of quartz and ore. As soon as it connects with the stopes of the 2600 level, the usual qnantity of ore will again he extracted. As the ore is mined it will all then he sent downwaard to the 2700, and thence directly ont to the shaft.

The joint Sierra Nevada west drift on the 2900 level is now passing into material that gives fair essays. The chances for finding a paying deposit of ore in that direction are considered good. The Union sonth drift on the same level continues in the same channel material heretofore noted. It contains many streaks that yield low essays. The same is true of the drift going north on the 2700 level of the Sierra Nevada, and west on the 2700 level of the Mexicsn.

At the middle mines all is now awaiting the connection on the 2600 level with the Comhination shaft. All is again demoralized at the south end of the lode hy the hreak-down of the Alta machinery.

H. Laughlin, one of the psrty of smelters who recently left here for Arizona, says the Eureka *Sentinel*, retnrned on Tuesday evening. He reports that they made a great snccess with the Pinal Con. smelter, a 30-ton furnace, and tnrned ont a large amonnt of hnllion, but the charcoal gave out, and operations had to be suspended. It was clearly demonstrated that the ore was not refractory. The charcoal nsed was not as good as that employed here, being made of cottonwood, hut it would answer if none other could he procured. W. J. Stevens will not return to Eureka. He has heen placed in charge of the mine and furnace during the absence of Supt. Donnelly. Mr. Lsughlin speaks very highly of the Pinal Cón., and helieves that it is a hig mine, with lots of ore, which will in time yield good returns to the stockholders.

Every one collecting ore for the Denver Exposition should remember that three pieces of the pay mineral and three pieces of the footwall and three pieces of the hanging-wall are wanted; in size they should he, as near as possihle, two hy six inches. The more expedition used in collecting, the hetter, and the sooner they are sent in to the exposition the hetter will he the classification there.

Two small quartz mills are heing erected for the Clover Patch mines, hetween Benton and Round Valley, in Mono county.

The building of the Denver Exposition cost $150,000. The whole sum was contrihnted hy the people of Denver.

The "Practical Steam Engineers' Guide."

We have received from Henry Carey Baird & Co., throngh A. L. Bancroft & Co., of this city, the "Practical Steam Engineers' Guide," in the design, construction and management of American stationary, portahle steam fire engines, steam pumps, hoilers, injectors, governors, indicators, pistons and rings, safety valves and steam gauges. The work is for the use of engineers, firemen and steam users, and is hy Emory Edwards, author of "A Catechism of the Marine Steam Engine," etc. The work is illustrated by 119 engravings. This book is intended for the class of men who have not had the advantages of a technical education—men who have much to learn—and not for "experts," who have nothing to learn.

After a hrief review of the history of the noncondensing steam engine, will he found in this volnme many of the most popnlar makes of steam engines hy our most celehrated builders, fully described and illustrated. The one particular ohject for so doing is this: Stationary engineeers, as a rule, seldom remain for any length of time at one place, and are ever, for one reason or another, changing from one situstion to anotoer. In nearly every case they are hrought in contact with a different make of engine from the one to which they are accustomed, and it frequently takes them days or weeks hefore they get "the hang of the thing," as they express it. The essential difference between the different makes of engines is in the valves and valve-gear; hut in other respects there is very little difference, if any. Mr. Edwards says that he has often heen requested, hy young and intelligent engineers and mechanics, to name snch newspapers and hooks devoted to steam engineering as wonld prove hcneficial to them in their prsuit of knowledge, and aid them to keep themselves posted in this age of rapid progress.

To these, he says: Read and study all the papers and hooks on the suhject you can put your hands on; hut possesp, hy all means, a history of the steam engines from the time of Nero, 200 B. C. down to 1881, "The Growth o' the Steam Engine," hy Prof. R. H. Thurston, and for the theory of the steam engine, "Textbook on the Steam Engine," hy T. M. Goodeve. Both of these valuahle hooks can he had of the puhlishers of this work.

As we have said, one chapter is on standard American stationary engines, another on standard Americsn stationary hoilers, another on standard American portahle steam engioes and hoilers, another on American agricultural engines, another on American steam fire engines. Then we have a chaptsr on Amer can steam pumps, another on in jectors; one on steam engine governors, one on indicators, slide valves; the piston and its rings, safety valves, steam gauges, and then a very excellent chapter on the practical notes on the management of steam engines and hoilers. The first part of the work is in the form of a catechism; that is, the introduction is in the form of a catechism. The language is plain and the engravings clear. There are no abstruse mathematical problems, and no "side shows." In fact the hook is one for the nse of ordinary people who only have ordinary educations, and will he found exceedingly useful to everybody having any interest in steam in any direction.

Innocent New Yorkers who deal in mining stocks, hny Glohe Copper under the helief that they are getting Old Glohe Copper, which is a mine, and is heing worked and turning nut copper hullion at an astonishing rate. Glohe Copper is still in emhryo with nothing in sight to render stockholders juhilant.—*Silver Bell.*

Mining Summary.

The following is mostly condensed from journals pub. lished in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

Our Mines.—*Monitor-Argus*, July 6: The mining interests of Alpine county are looning up with better prospects of snccessful mining than for many years past. That we have rich mines in Alpine county is proven hevond all doubt, and we predict that within the next 12 months the mines of this county, with the yield of the precious metals, will not only amaze the oldest Alpiners, but will astonish the whole world. The ore which is now being taken from the Stella mine is improving in richness as the sinking on the ledge progresses, and is worked at the company's mill, under many disadvantages in the working of this c'ass of ore, as their facilities for roasting and precipitating are very limited at present, but the ore is now being milled, leaving large profits to the owners. The Orion G. & S. M. Co.'s claim, adjoining the Stella, is an exceedingly favorable location, and work is being vigorously prosecuted, with favorable prospects of soon striking a rich body of high-grade ore. Work will soon be commenced on the Joe Davis and the Illinois California mines; these are both very favorable locations and will be thoroughly prospected during the present season. While our quartz mines are budding, we have a hydraulic mine in full bloom, to wit: The Alpine Hydraulic Gravel M. Co. commenced piping their grounds a few days since, with prospects of it being a rich paying mine in the near future.

Orion.—*Monitor-Argus:* We learn that the Orion G. & S. M. Co. encountered a heavy flow of water in the face of the east drift on the 100 ft level of the company's shaft on the 1st instaut. The hoisting espacity of the horse whim on the mine not being sufficient to hold the flow of water under control, the superintendent has started a tunnel from the level of Mogul valley to tap the water on that level, and drain all surface water from the ledge, when work will be resumed again in the shaft. A heavy clay gouge was encountered on the 100 ft level of shaft, being 12 ft wide. When the water broke through from the ledge it came with sucb force that it was impossible to handle it to give time to examine the character of the ledge, and they were flooded in a very short time. The company haa run 100-ft of tunnel in 14 days, and are crowding work with true mining energy, and they soon expect to reach the ledge.

AMADOR.

Jackson or Kearsing.—Amador *Ledger*, July 12: Rock is being hauled from this quartz mine, situated within the town limits, to the Kennedy mill to be crushed. It is contemplated to haul 200 tons and mill it as a test of the actual milling value of the ore. The rock is, to all appearance, of good quality.

Kelly.—The mill is idle at present, owing to the want of water. All the water is being used for irrigating purposes, which bas necessitated the stoppage of the mill. Work is being prosecuted upon the mine.

CALAVERAS.

Jones.—*Mountain Echo*, July 12: Holsting works are now in course of construction on the Jones mine, and will be completed in a few weeks, when sinking will again he resumed. A crosscut is being run, which has already penetrated 13 ft into the ore body, and the end is not yet reached. Mr. Porter has become so satisfied with the appearance of the mine that he feels justified in expending a large sum of money in its development. A gentleman named Mills, from San Francisco, and who is extensively engaged in mining in Nevada, Arizona, New Mexico and California, says, after a thorough examination of the Jones mine, that in all his travels in the various mining countries above named, be has seen few richer silver mines, especially when considering its depth, which is about 100 ft.....The shaft on the Invincible is now about 60 ft deep, and the lead 18 inches in widtb. As the shaft is sunk deeper, the vein grows wider and the ore richer. It is owned hy Keys, Leeper & Co., none of whom possess money sufficient to open the mine properly; it is therefore a good investment for capitalists.....Lindsay & Co. have driven their tunnel into the hill over 150 ft, and will have 100 ft farther to go before reaching the old works. They have, however, found good prospects in several places along the course of the tunnel.....Findley & Love, who were compelled to discontinue sinking on the Dock Hill mine, on account of water, are going to sink the pump shaft deep enough to enable them to continue sinking the main shaft.....William Osborn & Co. are still busily engaged in working the Black Oak mine. It is prospecting well.....Osborn & Co. have at last completed their mill, which is now in full operation..... We understand that work is to be commenced on the Monarch mine in a few days.....Work on the Potter mine still continues, and the vein increases in width and richness.

EL DORADO.

The Seam Mine.—Georgetown *Gazette*, July 14: We are glad to see the old Parsons Seam mine once more coming to the front. We visited this mine one day last week for the first time since Mr. Hanson, the lessee, began sinking his shaft for working the 2d level, more than a year ago. Mr. Hanson was busy with his 10-stamp mill, but kindly placed us in charge of his foreman, Mr. Jas White, who showed us through the works of the mine, and granted us permission to prospect with pick and pan on the lower level, where the boys are at work. It is always considered a favor hy the writer to do a little prospecting when he visits a mine, for then he gains a little practical knowledge of the mine he visits. We were surprised to find mnch work done on the lower level. The best pay seams were known to exist nearly 200 ft from the working shaft, and a large amount of work, with little pay, had to be performed; but the expected pay has finally been reached, and promises to equal that found on the upper level. They are now in a handsome paying seam of considerable thickness, in the face of their tunnel, and expect soon to cut another still better. At this point it is fully 250 ft on a perpendicular to the surface. The ventilation is good. We found handsome pay prospects in all the seams we prospected, in one pan obtaining as high as two ounces of gold. This is the first time we ever prospected with pan by a candle light in a mine, and we assure you that we did not injure our eyes in looking for a prospect there. We could say much more, hut, having promised not to be "sensational" in our account of the mine, we refrain from further divulgeuce.....The Aultman mine, near Greenwood, is now being worked night and day. The two new Frue concentrators recently added to the 10-stamp mill, work to perfection. Mr. Linehan, of this place, just up from the mine, is highly pleased with the manner of working and general management of the mine.....Good clean-ups at the Slide mines are reported this week. After a short run the Pacific cleaned up $950, and the Blue Rock $1,400. This is considered very fair for two and three mens' work on the respective mines. Inside of three months; but we are told that this amount exceeds but little their average clean-ups.

INYO.

Kearsarge.—Inyo *Independent*, July 15: The new 50-ft shaft in the Kearsarge tunnel now lacks but 12 or 15 ft of completion. The bottom is in a fine ledge. No one acquainted with Kearsarge rock but can tell that it is rich at a glance.

Brown Monster.—Mr. Chalfant reports that his experiment of working concentratious in pans at the Brown Monster mill is likely to prove a fair success, so far as he can judge at present. We are unable to give particulars as to the results at present, because we don't know any.

Supplies.—A pack-train, loaded with general supplies for the Keynot, started over last Thursday. Some loads were taken over, also, by Jack Welch, to supply workers on the Lapwing property.

MONO.

LUNDY.—Homer *Index*, July 8: N. M Parsons has had the pack trail completed to the Cascade mine, on the northern slope of Mount Gilcrest, and is now driving a tunnel in the ore vein. The ifearne arastra, situated east of Lake Lundy, and recently purchased by Mr. Parsons, will be started up early next week on ore from the Cascade, which is rich in free and coarse gold.

BAY QUEEN.—Some delay was experienced in getting the machinery for the blower up to the Bay Queen shaft, and hence the sinking of the winze from the north end of the north drift to meet the tunnel from the east was not commenced until late in the week. Everything is now in position, however, and work is being vigorously prosecuted, both in the winze and tunnel.

THE GORILLA.—A man-way has been constructed in the upraise from the lower tunnel, which has greatly improved the air in that compartment of the mine, and both the upraise and the shaft sinking to meet it are now being pushed with all possible dispatch. The ore reserves are ample for many months to come, and the company's reduction works are kept running day and night.

GREAT SIERRA-TIOGA.—The tunnel has been driven 22 ft since last report, and the work is progressing favorably. A double compartment shaft has been commenced at a point where the tunnel will intersect the Sheepherder lode.

NOTES.—J. C. McTarnahan expects to make a big clean-up this season from his deep gravel diggings at Dogtown.....William J. Callahan has discovered a small but very rich ledge of decomposed gold quartz near the Lee Vining creek gravel diggings, the contents of the fissure giving about 5 cents to the pan without crushing.....Considerable activity is again observable in the old Mono diggings.

BODIE.—*Free Press*, July 18: During the past week there has been a marked improvement in the south drift from the east joint crosscut, 275 ft below the 512-ft level of the Noonday and North Noonday mines. The face of the drift, at 100 ft south of the crosscut, is in very rich ore.....The Oro reports a most encouraging change in its north drift, 714 ft level, where ruby silver and sulphurets are shown in abundance.....The Red Cloud shaft is down 775 ft.....The Bodie last week crushed 110 tons of ore, assaying over $127 per ton. The shipment was $10,093 54.....The Lent shaft is now 1,010 ft deep. After a sufficient depth for sump has been attained a level will be run at 1,000 ft. This will be, indeed, an interesting level.

NEVADA.

THE LITTLE BONANZA.—*Tidings*, July 15: The little "find" lately made by H. B. Nichols, is still panning out well. A new shaft has been sunk to the depth of 8 ft and encountered a stringer of quartz 1 inch wide this morning, which pays $7 to the pan. Our reporter interviewed Mr. Nichols this morning, and he informed us that up to 8 o'clock this morning $50 worth of free gold had been taken from this one shaft. Had this occurred in South Africa or some of the islands of the sea, the telegraph reports would be full of it, and a big rush of prospectors for that place would have been made.

PLUMAS.

STRUCK IT.—Plumas *National*, July 15: A report comes to us that Frank Terry and partner have found a splendid coarse gold prospect in a ravine near the mouth of Bear creek, on the Middle fork. They panned out $60 or $80 the other day, one piece weighing $50. What the extent of the mine is we have not heard, but it is in a good gold country, and likely to be very valuable. Frank is an energetic prospector, and deserves a good stroke of fortune.

ANOTHER BIG MINE STARTED.—During the past week active operations have commenced at Claremont hill, with every reason to believe that the work will be permanent and another prosperous and paying mine opened. The main tunnel will be pushed as fast as possible, three shifts being at work, with Mr. Wm. Meikle as underground foreman. Ten men are now employed at the mine. The company has been formed in London, by Mr. Levy, who was here on mining business two years ago, and we are led to the belief that means will be forthcoming for the development of the property. That it will prove good there is scarcely a doubt, and we are heartily glad to know that a solid financial basis has been reached. The owners have expended considerable money and labor on the mine, but have not succeeded in opening it right. They have full confidence in the result of the present operations, however, and the outlook is that the blue lead will soon be giving up its riches at Claremont hill.

A FINE MINE.—From a gentleman who came down from Long Valley the other day, we learn that the mining prospects are in a flourishing condition, and the outlook good for the season. The mine owned by Herbert & Wheeler, on Long Valley creek, is showing up particularly well this year, and bids fair to be one of the best hydraulic mines in the county. The owners have made several attempts to get into it, but have not succeeded until this summer. They have a ditch over 5 miles in length, which, with the reservoir privileges, can be made to furnish all the water needed for 6 or 8 months in the year, and the water comes to the mine with a fall, to bedrock, of over 300 ft. This dump is all that could be desired, and ages would elapse before it could be filled up. The face of the bank is now 50 ft, but will run up to 200 or 300 ft in a season or two, all fine looking gravel, and carrying some gold from the top down. Near the bedrock the gold is coarse, and we were shown a number of pieces—heavy, washed gold—which proves it to be an ancient river bed, and of the right character. The owners have everything that goes to make a valuable hydraulic mine—good pay gravel, water-pressure and dump. They should realize a large amount of money from the claims, and the best part of them is that they cannot be worked out for years.

SOUTHERN EUREKA MINE.—Greeneville *Bulletin*, July 12: The unsatisfactory results from this mine have led to a complete change in the management. An organization in New York, known as the Conservative O. M. Co., has negotiated for a 10-years' lease of the mine. The president of the company, H. H. Leavitt, Esq., is now here making a thorough examination of the mine; this gentleman expresses himself satisfied, and his company has closed the contract for the time named, and will proceed to erect all the additional milling capacity that may be needed for working the mine up to its full output of ore. It is also the intention of Mr. Leavitt to bring on a diamond drill and explore the entire ground owned by the company, and, if this exploration will warrant it, to build all the milling capacity that can be supplied with ore, though this should be 60, or even 100 stamps. He has already examined all the stopes and drifts very carefully, taking samples of the ore from every accessible point and prospecting it with mortar and pan, and the result has very much increased his confidence in the value of the property; the ore body is of immense extent and gives good prospects at all points. Mining men here always believed that the Southern Eureka was a good mine, and all will be interested in knowing that there is now a likelihood of it being worked with energy and perseverance.

TAYLOR-PLUMAS MINE.—The owners of the Taylor-Plumas will soon build a new 20-stamp mill, and, when this is done, it will be found that the mine is one of the most valuable in the State.

SIERRA.

ROBBERY.—*Mountain Messenger*, July 15: The dirt dirt taken from the sluices of Owen Thomas, at Eureka, was stolen from his blacksmith shop, where it was left temporarily, by thieves, a few days since. No clue to the thieves. It amounted to several hundred dollars.

BONDED.—The extension of the Good Hope quartz mine, Downieville, has been bonded to George Hearst for $10,000, for 90 days. Work will be begun soon and prosecuted for three months, when, if the development is satisfactory, he will take the mine.

A GIBSONVILLE MINE.—Sierra *Tribune*, July 12: At the Union drift mine, located at Gibsonville, this county, great encouragement has recently been met with by the discovery of a back channel, which, we are informed, prospects very favorably. The claim has been worked quite extensively for a number of years past, and has produced a large amount of gold. The front channel has been pretty well worked out, which fact prompted the company to prospect in new quarters. Their success will undoubtedly give the mine a new lease of life.

TUOLUMNE.

THE GREEN.—Tuolumne *Independent*, July 15: We have a good account of the Green mine, situated about two and a half miles above Northup's, and owned by Clarke, Brown & Co. A 10-stamp mill has just been erected by Jim Tullock, with all the modern improvements. The mill was erected in 54 days, working time, all the heavy timbers having been hewed out with a broad-ax from the forest on the ground. The iron work was made at the Sonora foundry, and the proprietors are more than satisfied with the contract; and it is said that the mill is the finest and quickest built on record. They started up on Monday night, and have run continuously ever since, merely stopping to oil up. The mine is looking well—most of the ore good enough to manufacture jewelry out of. The lead ranges from 18 inches to 4 ft. wide, and the tunnel, which is 130 ft long, demonstrates a chute the full length as far as driven. There is 1,000 tons of measured ore in sight, that will go $40 or more per ton. This mine was discovered and worked in a small way years ago, the present being a new discovery on the same ledge. This fact should encourage miners to consider the merits of abandoned mining properties. This lead lays in a group of mines that have turned out several millions of dollars to the owners. A few good mining properties of this sort will inspire confidence and put new life in Tuolumne county.....As placer mining has almost subsided accidents from caving banks and otherwise have become proportionately less frequent, and our columns now-a-days are seldom freighted with the sickening details of mining accidents. A company of miners have commenced to open up an old gravel claim near the Dry Arroya. One of the owners, Pete Mawk, heeding not the premonition of a dreadful cave in the mine in a dream the night previous, went somewhat reluctantly to work the next morning. He had not been at work long under the hanging bank before several hundred tons of dirt and bowlders descended. With unaccountable superhuman effort he barely escaped being covered up 20 ft deep, one leg only having been caught fast in the debris. Dangers, frequently associated with, becomes so familiar and so often harmless that they are encountered without fear, and to the timid and inexperienced are looked upon with horror, and the acts of the venturer are considered the acme of bravery, when in reality they are as commonplace to him as the air he breathes.

NEVADA.

WASHOE DISTRICT.

CALIFORNIA.—*Enterprise*, July 16: On the 2700 level are cutting a drain and retimbering in the joint Consolidated Virginia east drift. Are still extracting ore from the old croppings.

CONSOLIDATED VIRGINIA.—On the 2700 level the joint California east drift is being retimbered and a drain is being cut in it.

SIERRA NEVADA.—On the 2000 level the joint Union Consolidated west crosscut has been advanced 22 ft.

MEXICAN.—On the 2700 level, west crosscut No. 2 has been sunk 30 ft, and winze No. 1 has been sunk 7 ft, the bottom showing some fair milling ore.

OPHIR.—On the 2700 level are enlarging the station in the joint Mexican winze to make room for blowers and fans. During the week have extracted 95 tons of ore from the croppings.

UNION CONSOLIDATED.—During the week 351 tons of ore have been extracted from the 2000 level, and 269 tons and 1,130 pounds sent to the mill. Bullion shipped during the week, $17,870.27.

YELLOW JACKET.—Since the last weekly report the water in the mine has continued at the same point. At the Winters shaft the west cross-drift on the Sagebrush or 190 station is being advanced in a favorable looking ground. On the 10th instant started to re-open the old second or 300 level. The Kentuck mine is working in good ore near our line on this level.

BELMONT DISTRICT.

THE FIRST BAR OF THE EMERSON.—Cor. *Courier*: On Wednesday last the Emerson Consolidated mill and mining company shipped the finest bar of silver bullion ever produced in Belmont. It weighed 1,103 ounces, and was 999 fine; netting, $1,206.35. Quite a number of Belmonters examined the bar, and warmly congratulated Mr. George Emerson for his pluck and energy. Some of the few croakers left in Belmont, who always insisted that Mr. Emerson's enterprise would certainly prove a failure, also went into Wells, Fargo & Co.'s office to see the brick. They looked sad, and no doubt felt sad, to know that the mining claims in the immediate vicinity of our town contain silver ores that can be reduced profitably. Some of them went even so far as to lift the bar, so as to thoroughly convince themselves that it was not stuffed with sawdust. The Emerson company expect to ship another and more valuable bar in about 12 days, as very favorable indications are that the Emerson mill will be kept pounding away on ores from this district for a long time to come. The croakers are also very much disgusted with Mr. H. Harries' successful operations in leaching the roasted ores, and some of them have at last wisely come to the conclusion that they don't know everything; but it took a $1,240.35 silver brick to convince them of that fact.

MILL.—Eureka *Sentinel*, July 17: Messrs. Radovich and Frisbie, who compose the Bullion mill and mining company, in Bullion district, 25 miles south of Beowawe, are starting, and will be ready to run in a few days, a 5-stamp mill, with furnaces and all necessary machinery for the reduction of their ores. They have over 500 tons of ore ready on the dumps, which they will commence to reduce as soon as the mill is completed. It is reported to us that this ore will average from $250 to $300 a ton. The ore is antimonial silver, with a slight trace of arsenic, and is very easily worked by the roasting process. The quantity of ore accumulated is accounted for by the fact that it was extracted to be worked by the wet process, which, failing, left the ors on the dumps. Considerable ore has been shipped from this district from time to time to Salt Lake for reduction, the returns from which have been very profitable. The mines in the district are the Nutmeg, Lady of the Lake, Union, Osceola, Campbell, and probably 20 others, work being done in nearly all of them at present, 2 or 3 men working on a mine, the ore of which they haul to the C. P. railroad in wagons, and thence ship to Salt Lake. In the future the ore will not be shipped away, but will be worked in the district, at the Bullion mill, the capacity of which will be increased as soon as possible, machinery and lumber having already been ordered for the purpose.

BRISTOL DISTRICT.

MAYFLOWER.—Pioche *Record*, July 8: The Mayflower mine, of Bristol district, is developing excellent and promises well. Work is being pushed ahead by Billy Roe and Foreman McQuaig, who are sinking the main incline, and running drifts to connect with the winzes and ore body. In fact, the company is now engaged in working the mine into shape, a thing that should have been done months ago, but those in authority refused to permit it. The ore in the mine looks good. The Bristol company are talking of placing a hoisting engine up at this mine.

DEED OF TRUST.—The first part of this week, a deed of trust, made by the Bristol M. & M. Company, party of the first part, to Henry T. Welles, of Minneapolis, Minnesota, party of the second part, was received in Pioche to be recorded. The deed is a lengthy document, being 20 pages of print. The company has given three notes, $10,000 each, making a total of $30,000, bearing 10% interest per annum, to said Henry T. Welles, for money loaned the company. The instrument is very binding, and gives Mr. Welles full power to do just as he pleases with the property. Of course this deed has nothing to do with the Mayflower mine, as that is a San Francisco incorporation. Owing to a misunderstanding, the report that the Bristol Company has mortgaged its property has gone abroad, and caused uneasiness in the minds of some of the employees. This is not so. Though the Bristol Company is not working any men on claims belonging to that incorporation, yet should men be placed at work on them, which is not at all likely, the parties so employed can file liens against the property on which they have been working. The only caution necessary is to get work on property worth filing liens against.

COLUMBUS DISTRICT.

NORTHERN BELLE.—Candelaria *True Fissure*, July 15: Last week was a sorrowful one for the Northern Belle, the accident to the late superintendent, R. J. Jones, resulting in his death, being a sad blow to all the employees, and to the community at large, by which he was held in the highest esteem. Owing to the accident, and the fact that the Fourth of July was observed as a holiday, the week's work was one day and a half less than usual. During the week the small drift, mentioned last week as connecting the fourth and fifth shaft levels, has been fully enlarged, and the main drift of the fifth started west to explore that section of the mine. In the intermediate, between the second and third levels, the ore is of good grade, but does not show as much in width as last week. Bullion shipments for the week ending July 13th amount to $13,812 40. Shipments on July account, to the 13th, amount to $25,352.69.

EUREKA DISTRICT.

A STRIKE.—Eureka *Sentinel*, July 15: The Hodgdon mine, adjoining the Geddes & Bertrand on the west, a very old location, owned by the Hodgdon brothers, who have been working on their claim continuously for the last two years, we are informed, have at last been rewarded for their toils and struggles against adversity. In their first prospecting they got a small body of rich ore near the surface, from which they realized several thousand dollars. After that they found nothing to pay, but have followed ever since a small seam of very rich ore down 100 ft, branching out, however, in all directions, to thoroughly explore the property. Within the last few days, in following the little seam mentioned, they were led to a large body of low-grade ore. The strike would be valuable under any circumstances, but especially on account of the proximity of the Hodgdons' claim to the Geddes & Bertrand reduction works. It is thought that the Hodgdon brothers desire to dispose of their property they can sell it for a handsome amount. This strike will add very substantially to the life of Secret Canyon.

LEWIS DISTRICT.

BETTY O'NEAL.—Lewis *Herald*. Owing to a stoppage of the pumps in the Betty O'Neal shaft, caused by the packing being cut out by the small pieces of quartz drawn through the suction hose, and the water filling the shaft to the first level, but little sinking has been done during the week. The pumps are now running in good shape, and to about their full capacity. The shaft men are at work again, and in a few days the extent of the new strike will be known. The ledge in the different levels is looking fine, and rich ore is being taken out, though no stoping is being done yet. A level has been started from the bottom of the winze, and the ledge pans out rich and large. The ore on the dump is of first-class quality. We expect to see Betty O'Neal shipping ore again inside of a month.

MORNING STAR.—Lumber is being hauled for the Morning Star mine, for car track, and work will be resumed shortly. The grade for a wagon road is progressing finely, and when completed will be a great convenience to the company.

EAGLE.—The tributors on the Eagle are still taking out good ore, and doing well on their lease.

TYBO DISTRICT.

STARTED.—Cor. Belmont *Courier*: The Tybo mill has started. Work was also resumed in the 2-G mine. A long and prosperous run is anticipated.....Several valuable mining locations have been made on the extension of the 2-G lode.....The Mountain View mining company's mill is expected to start up by the 10th of next month.

WHITE PINE DISTRICT.

HAMILTON NOTES.—Cor. White Pine *News*, July 15: There seems to be a little more mining activity along the line than for some time past, and we sincerely hope, in the sweet bye-and-bye, to record favorable results. The Eberhardt Company is pegging away with its seven tenor, which, I believe, no particular change. Senator Rockbill, S. E. Sterratt, Sam Paul, Oliver Whelan, Thos. McKinna and Billy Wilmarth are engaged in chloriding around Treasure hill. Corcoran, Jacobson, Hoppe, Shepherdson and Kraniez are working at different points on the western slope of Treasure hill. Colonel Grandeimyer has some men at work upon one of his mines, and I understand he intends shortly to do some developments in another direction.

ARIZONA.

FINE COPPER ORES.—Tombstone *Republican*, July 12: At H. W. Kearsing's assay office may be seen a fine collection of copper ores from the Lone Star district, on the Gila river, brought in by Mr. E. Bellya, who, with Messrs. Kearsing and Connor, are the locators of a group of 8 mines. Work has been confined to 1 of the group called the Alvaretta, upon which a shaft has been sunk 10 ft, disclosing a 4-ft vein of solid ore that assays $37.71 in silver, and from 40 to 84 per cent. copper. The ore is a combination of carbonate and sulphide, there being sufficient carbonate to constitute it a free smelting ore. The indications on the other lodes are that the ore will be identical in its nature. These mines are located 7 miles from the Gila river with a good, natural grade thereto. There is plenty of wood near at hand, thus making better than the average facilities for working.

TOMBSTONE.—*Epitaph*, July 18: There is nothing of unusual consequence to chronicle in the mining annals of the Tombstone district this week. Everything is going along about as usual; the producing mines are turning out the customary quantity of ore, and the mills are pounding away as usual. Work was commenced on a number of new claims since our last, and the prospect of a busy mining season is very good. The Contention declared a dividend of 25 cents yesterday.

IDAHO.

GALENA UNCOVERED WHILE DIGGING A WELL.—Wood River *Times*, July 12: The latest "find" reported is from the Star mine, about 1½ miles southwest of Hailey. A few days ago a man was put to work sinking a well near the boarding-house, at a point almost 15 ft north of the old vein. At a depth of 4 ft he struck iron ore, and a foot or two deeper he cut a seam of galena. At the depth of 9 ft the seam of galena had widened to six inches and appeared to be still wider in depth. There is considerable curiosity manifested as to the extent of this new find.

SMOKIES.—F. J. Scott, the well-known mining man, returned yesterday from a trip to the Smokies. He found the Salamander, Silver Star, King of the West and a few other claims being worked systematically and opening very satisfactorily. The Carrie Leonard and many other claims are idle, and likely to remain so for some time, at least. There are some very promising prospects in the Smokies, Mr. Scott says, but they are not opening up as rapidly as has been anticipated.

BANNER.—Idaho *World*, July 10: The Banner tunnel is in over 500 ft, with 300 more to run. The vein will be tapped about September 1st. The mill will probably not be started up before next season. If a large body of ore should be tapped with the tunnel now being driven in, the company may start the mill going the coming fall or winter. J. Brown, superintendent, will be out the first of next month. The Elmira company has not exhibited any great amount of push and go-aheadativeness the last 2 or 3 years. The mill has not been pounding more than 3 or 4 months each year, which fact leads many to the belief that the mines have "petered." The miners at work there tell us the Banner looks fine in the bottom of the shaft that was sunk last year, and that the tunnel will undoubtedly open up a body of first-class ore. The company has done a great deal of necessary dead work since taking hold of the Banner property, and it looks like it would be to their interest to start up the mill it a sufficient body of ore is struck on which to make a run. The Crown Point, also the property of the company, is opened up to a depth of 300 or 400 ft, and if it is the mine it is claimed to be, can furnish ore enough to keep the mill going a good portion of the time. If the Elmira company would go ahead and work on a larger scale it would be a great benefit to this portion of the country, and it seems to me that it would be to the interest of the company to turn out bullion as fast as possible. All the ore that has been crushed as far has paid well. The company works very slowly. They undoubtedly have reason for not going ahead more vigorously. What their reasons are is not known.....K. P. Plowman stopped work several days ago in his hydraulic claim on the north side of East hill, but the pipe is still knocking down good payday in the claim on the south side of the hill. Plowman has done well this year—better than usual. He has made a number of clean-ups since starting in last spring, and the result of every one was a big bulk of the yellow stuff.

RECENT STRIKES IN WOOD RIVER.—Idaho *Statesman*: A new mining district on the west side of Garfield gulch, about 1½ miles from Muldoon, is said to show 4 distinct veins running parallel in a southwesterly and northeasterly direction, in regular Comstock porphyry, and carrying high-grade milling ore, showing some sulphur and antimony, but no lead. Sam Wilson and Jim Vear, two old prospectors, are the lucky men who made the strike.....A strike of high-grade galena and carbonate ore was made in the Senate mine, near Galena, about a week ago, at a point 230 ft from the surface. The ore vein is said to be 12 ft wide.

MONTANA.

TROUT CREEK.—Helena *Independent*, July 15: The new mill of Messrs. Billings and Potting, on Trout creek, has put new life into the adjoining camp, and lodes that have for a long time remained unworked on account of a lack of the proper facilities to render their product valuable, are now putting out ore in considerable quantities.....The Gold Bluff is opened by a tunnel following the vein in from a steep hillside. It is estimated that by penetrating the lode for a distance of 100 ft there will be considerably over 100 ft of ground opened for stoping above.....The Home Ticket has been worked to some extent lately, but it is found to contain too much lead to allow of its reduction in a plain good mill. A shaft has been sunk to the depth of 40 ft., from which points levels are now being run. Assays of the product of this vein show an average value of $50 per ton for a distance of over 2 ft across the pay streak.....The Queen of the West, owned by parties in Helena, among others, it is said, will soon begin development, and it is not unlikely that the old-time camp on Trout creek will again become a point of interest and importance in the mining annals of Montana.....The Lee Mountain Syndicate is developing 7 locations on Lee Mountain, all of which were made under the old law, and cover 2,200 ft each along the vein. This district is about 16 miles from Helena, and was formerly called Young Ireland by its first locator, John Caplice, who, in 1865, recorded the locations named Young Ireland, Chantart and Wolftone, but the region is now known as Ten Mile. The 7 lodes above named are under bond, which expires on the first day of January, 1883, and if, by the expenditure of $25,000, it is found that the property is of such a character as to justify it, a large stock company will be formed with ample capital to meet any emergency that may arise.....The Banner Co. has recently secured the necessary means to develope their property, and 8 men have begun work under the direction of William Scbollar, a man of large experience in his specialty. The lower works are to be pumped out and the mine thoroughly tested as to its capability of producing good grade ores in reliable quantities. We understand the Gregory Co. has offered very favorable terms to the Banner Co. to induce a full exploration of their property, and after the ore product has been concentrated upon the very favorable terms offered, they will buy the concentrations at the maximum of value that can be afforded during the time employed in the prospecting of the mine. We feel confident of good results from this move on the part of the Banner Co. From 586 tons of the ore of the Albion mine, of Bald Butte, the yield has amounted to $12,687.69, under the single-stamp mill. The last bar from the Gloster mine, the result of a 9 days' run of the 60-stamp mill and 12 days of the 20-stamp mill, is valued at $10,490. The shaft is now 260 ft deep and all in ore, and in several places in the 200 level the pay is 14 ft. wide.

NEW MEXICO.

GEORGETOWN ITEMS.—*New Southwest*, July 8: The mines of this place are turning out some very fine ores of late. Some very rich and extensive pockets of a very high-grade, one having been recently struck containing horn silver and "black metal" a very high-grade carbonate.

BURRO MOUNTAINS.—Everything looks bright and cheerful for the great industry in the Burro Mountains mining district, and the prospects of continued prosperity are flattering in the extreme. The number of new prospects that are being actively developed is far in advance of any that has been seen in the camp so far. They give hopes that ere many weeks there will be no less than 25 copper producers in the camp. The mines of the Valverde company are reported in better condition than at any time since the first blast was put in. Similar reports are heard from the Queen City mines, and at the Seawall Springs portion of the district, where developments have lain dormant for some time, activity seems to be the order of the day at present. The ore bodies being encountered at this place are assuming grand proportions, both in quality and quantity.....The silver mine, belonging to Col P. R. Smith, Asa Kilburn and others, has assumed the dignity of a bonanza. The work on this mine is being prosecuted vigorously, and from $500 to $700 worth of mineral hoisted daily. The shaft is down 75 ft, with two excellent walls and a ledge 9 ft in width in the bottom of the shaft, with a mineral vein consisting of yellow and green chlorides and some bromides of silver, 4 ft wide, which will average 300 ounces. This mine promises to be one of the largest bullion producers in this Territory.....The Blue Mamma mine, owned by W. S. Lemon and J. H. Dugan, and located near Walnut creek, is being opened up by its owners with push and energy.....Work on the Colwell mine, near Seawall springs, is prosecuted vigorously. Three shafts are at present employed, and a fourth is contemplated in a few days. The incline is down 35 ft, following the mineral from the surface, and the ore extracted is of an excellent character, improving in richness and quality as it descends.

OREGON.

NOTES.—Jacksonville *Times*, 14: The Squaw Lake Ditch Co. will resume piping in a new location next week ....DeLamatter & Newman are widening the ditch that carries water to their Cow flat diggings, in Josephine county.....The Sterling Co. is engaged in cleaning up, and we expect Supt. Ennis is taking out gold by shovelfuls.....Geo. Gielsman and Chas Feldt of Althouse, who have purchased S. W. Forbes' claim there, did well during the past season.....The Applegate Gravel Co., Dan Silva superintendent, made another clean-up the other day. We learn that these mines have been leased to Chinamen.....We learn that Mr. Derickson has ordered a small quartz mill from Portland, and will soon commence prospecting a number of ledges in this and Josephine counties.....W. A. Jones, of Applegate, informs us that J. T. Lyton still has a good head of water, but will soon commence preparing for a final clean-up. Prospects are favorable.....Water is running through Bybee & Fisher's ditch in Willow Springs precinct in large quantities, considerable of which is being utilized by miners, and more will soon be. The firm also has ground to rent.

UTAH.

THE LEEDS.—Silver Reef *Miner*, July 8: A visit to the Leeds mill the other day disclosed the fact that there is an abundance of property there held under the iron grip of the law. The large 10-stamp mill is as silent as the tomb, the mine no longer echoes to the welcome music of the hammer and drill, and the buildings have ceased to resound with genial hum of business activity. Everything seems pulseless and all but voiceless, and yet, if ordinarily good authority can be relied upon, there is enough wealth in the slum pits to relieve all embarrassments and place the company on a good footing again; if this be the case something ought to be done by those who control affairs.

A Big Debris Dam.

From one of the attscbees of the Blue Tent Mining Co., we learn that a mammotb dam, excelling anything ever before attempted in that line, will soon he commencsd. A suitable site has been sslectsd in what is known as Sailor ravine. Heretofore all the debris from this celebrated mine bas been washed directly into the South Yuba river, to wbich the anti-miners object. Not wishing to have any one complain, the company have hit npon a plan to stop all growling in the futnre. The propossd strncture will be ready to receive the debris from this mine in ahont 30 days. Nature has done ahout half the work at the place selscted, and the company propose to do the other half. In a few days all of their mammoth giants will he bronght into use to remove the immense howlders and cement to he oonveyed to the place where the dam is to be ersected. The foundation of the strncture will he of solid rock, and huilt up to a hight of 100 ft. Then another stone wall will he constructed of similar howlders, ahont 10 ft. from the main wall. The space between the two walls will he filled with hedrock and cement, msking it perfectly water, debris and bowlder-proof. According to estimates made hy first-class engineers, the new dam, when erected, will hold hack all the debris that can he worked in that seotion of country for 50 years.

The company had under consideration the plan now adopted, when the anti-miners oommenosd a crusade agsinst them, hnt believing they bad a right to dump into the Yuba river, wbich they had done for 20 years, and that the courts would so decide, they deferred doing anything in that line until now. They are convinced that they cannot continne the working of this claim in the old way, and seem willing to ahide hy Judge Temple'e decision, as rendered in the Gold Run case. Jndge Temple decided tbat he would canse the injunction to be raised in the Gold Run case, when it could be shown that that company had stopped the flow of howlders and heavy debris into the streams. The Blue Tent Co. found a way to conform witb tbose reqnirements, and instead of spending their money in law suits, tbey elected to erect their mammoth dam.

Lead Works at Salt Lake.

The Salt Lake *Tribune* says: For years the Germania smelting works, located seven miles sonth of this city, have heen doing an immense and successful business in the smelting of silver ores. Their business was so large a rsfining department was attached, and now the works separate the preoious metals from their lead hullion, thus adding sn important industry of itself to tbeir smeltsr. Tbe silver bullion of tbe works finds a ready sale in the Esst, while their lead has gained a well-merited reputation for its purity and excellent quality. The works at present employ abont 150 men in all the different hranches. Their annual product of pure lead now reaches an aggregate of over 3,000 tons. The most of tbis is shipped to San Franoisco, where it is msnufactured into white lead hy the works in tbat city. This white lead has gained a good reputation for its purity and good qualities, mostly due to the refined lead from the Germania works.

The Germania Co. have perfected their plans for much greater business than ever before, and it is of this new enterprise that we wish specially to speak. In the smelting snd refinery dsparts mants they will materially enlarge the works soon hy the addition of new furnaces.

White Lsad Works.

Buildings are at once to be erected, in wbicb to mannfacture white lead. The main huilding will he 75x150 ft., having a ground floor, a second story and an attic. This will be constructed with hrick walls, and have an iron roof, thus making it as near fire-proof as possible. Fifteen car-loads of machinery bave heen pnrcbassd and will soon arrive hore. This machinery consists of a large Porter & Allen engine, made in Pbiladelphis, a Bahcook & Wilcox hoiler, from New York, lead pulverizers, grinders and other machinery made in Bsltimore and otber places East. The machinery ordered for this nse will he capahle of producing 3,000 tons of wbite lead per annum, wbile the works will he so arranged as to douhle that capacity if required. The hrick is already made, otber materials are being prepared, and witbin the next 75 days the white lead works will be in operation. The process to he used in tbis manufacture is known as the Adams wbite lead process, heing greatly superior and more speedy than any otber in use. At present there are only three factories in the United Statss having a right to use the Adams process, those heing located at Omaha, Baltimore and Washington. All of these factories have met witb marked success in making fine leads, at low cost of manufacture, so tbat it is no experiment.

Now, to make tbis large quantity of white lead, requires a vast amonnt of linseed oil, and this offers an opening for another indnstry, which will also be under the management of tbe Germania company. Tbere is probably no more profitable class of farming than tbat of raising flax for the ssed. This seed always brings a good price, is easily raised, and after the seed is harvested, the fiber of tbe etalk is of market value for converting into paper or linen. A linseed oil mill will in time he erected to extraot tbe oil to supply the lead worke, and tbis new enterprise induces otber important industries.

Pips Works.

The manufactnre of lead pipe and sheet-lead will also he conducted by tbe company in the same building. Tben there is also another article wbich is to be manufactured. We refer to the article of sbot, which is very extensively nsed in tbe West. The old process of dropping from a very higb tower will not he used here, but, instead, a low tower and strong air onrents, under modern plans, will be nsed to give roundne's to the shot.

With the opening of new lines of railway, the Germania company will reacb ont for trade to tbe Pacific coast, north and south to Montana and Arizona, and east, wherever tbere is a market in which they can compete. Beyond our conntry, a large field for sucb manufactnred lead is found in Anstralia, New Zsaland, etc., and Utah is to seek trade there.

A person who thoronghly nnderstands the msnufacture of white lead will soon arrive here from Vienna, Anstria, to take charge of the chemical department of the works. Mr. Billing, the Manager of the Germania works, bas carefully investigated all the essential features of tbis new entsrprise, and there is no reason to donht the complete snccess of all his plans.

On Rocks.

[Lecture delivered before the Mechanics Institute, by A. W. Jackson, Jr., Instructor in Mineralogy and Economic Geology at the University of California.]

(Continued from last week.)

One more grouping I will mention of the bigbest genetic interest. Sometimes myriads of the little, bair-like forme arrange themselves with their longest dimensions parallel. They look as thongh—in fact, tbey are—in a little streamlet of the rock liquid that was solidified in the very act of flowing. One can even tell the direction in wbich the streamlet was flowing, for here and there are obstrnctions in tbe sbape of larger crystals, against one side of which the streamlet dashes itself, tbrowing the little hlack, hair-like forms into the wildest confusion, to reunite them upon the opposite side. Tbe obsidian from Lake Mono sbows tbis peculiar "micro-flowing texture," as it is called, in great perfection.

Ths Microscops and the Geologist.

Finally, the microscope has explained, very satisfactorily, the "porphyry texture" tbat is so characteristic for many rocks as to bave given rise to tbe nse of tbe term "porphyry" as a rock species. We have heen led to a knowledge of different stages of solidification. During the earliest stage certain crystals are formed and attain considerahle size; tbsse are tbe large orystals that are afterward seen in tbe porphyries, the rest of the rock liquid remaining comparatively free from crystals. Tbis takes place deep in the earth and during a period of comparative tranqnility. Tbis period of calm is then succeeded hy a period of agitation, for we find the larger crystals hroken or eaten into, showing powerful cbemical action, or a greatly increased temperature. During this period the rock is ernpted, perbaps reaches tbe surface of the earth through a volcano or fissure. In cooling tbis time, the fine-grainsd or glassy portion of the rock, which holds the larger crystals, is formed—fine-grained, hecause of the rapidity with which the oooling takes place.

Thus you perceive wbat an extremely important, indeed absolutely indispensihle, instrnment the microscope bss hecome to the geologist. It has thrown a flood of light npon a widespread class of rocks, of the real nature of wbich we previously knew next to notbing, and with its aid the whole snbject bas been rednced to some kind of system, and started up on a career of development which promises everything for the future.

Before leaving this subject of the methods of studying rocks, let me mention one otber tbat has heen perfected qnite recsntly.

You recollect I stated that tbe microscope does not enahle us to determine the chemical oomposition of rock constituents; hut evsn this can now he done. Previously, rocks have been analyzsd as a whole, hut that has cast comparatively little light upon the natnre of the rock. What we want to know is tbe chemical composition of eaob of the minerals which enter into the rock.

Observe the nature of the prohlem: In tbe fragment of any given rock there may be tbousands of minute grannles of five or six different minerals, and they are to he so segregated tbat all of the granules of each mineral are collected together, totally free from the granules of all of the otber minerals.

The separation depends upon the different specific gravities of the minerals, and upon the use of a liquid whose specific gravity can be changed at will.

Thus, snppose we have

Granite,	Quartz with spec. grav.	2.65
	Feldspar " " "	2 56
	Mica " " "	2.75

This is powdered until the granules of the different minerals are entirely separated from one anotber. Tbe powder is then put into a tuhe furnished with a etop-cock helow, and a solntion of iodide of mercury and iodide of potaeh, having a maximum density of 3.1, is added. Of course all of tbe above minerale float. Water is now added till the density of the solution is redneed just helow tbat of mica, the heaviest mineral in the mixture. It at once drops to the bottom, and is drawn ont through the stop-cock. More water is added, until the density of the solntion is redneed just below that of quartz. It falls and is drawn off, and we thus bave tbe tbree minerals oompletely isolated.

I have not described the exact manipulation. Several precautions bave to he taken, but you will readily understand the principle from this illnstration. In this way, then, we are enahled to completely separate tbe mineral constitnents of most rock; and now, hetween tbe microscope and the halance, it would he diffionlt, indeed, to find a orystalline rock the nature of wbich could not be determined. But a few years ago it was equally difficult to find a crystalline rock that *could* be determined.

Forms of Rock Massss.

With this we close tbe consideration of the methods of studying rocks. Let me now direct your attention for a few moments to the forms in which tbe rocks of different kinds ocour in natnre. Yon nnderstand tbat the earth's ornst is huilt np of huge, more or less regular, rock masses, that ordinarily, to tbe casnal observer, perhaps, seem quite devoid of any regular sbape, while at other times tbe regularity and simplicity of rock structure is almost startling. One who has sailed through the Casoades of Oregon, on the nohle Columbia river, cannot have failed to he impressed with the massive arohitectnre of the mountain cliffs upon either side.

There is, of oourse, a very considerahle diversity of form in which the same rock may appear in different places. I can call attention here only to tbe most typical for each of tbe larger classes of rocks which I have already distinguished.

Let me indicate once more tbese rock classes:

(1.) Amorphous.
(2.) Clastic.
Crystalline. { (3.) Crystalline shiste. Massive. { (4.) Compact. (5.) Macro-crystalline.

I bave given you now a general aocount of tbe hroader classes of rooks, an idea of the methods pursued in etudying any given rock, and a general conception of the forms of rock masses as they occur in natnre. There remains now but to give you a very hrief account, hardly more than an enumeration of the principal rock species themselves.

The names granite, hasalt, syenite, are familiar, and even propylite you sse mentioned in tbe newspaper reports from the Comstock. Bnt what do these names mean? Two or tbree different elements enter into the determination of the name to he applied to any given rock, viz., texture, geological age, mineral composition. By tbe texture of the rock, which is generally easily determined by tbe unaided eye, we can tell at once whether the rock is made up of fragments or is crystalline, and if tbe latter, whether shistoid or massive, and if massive, neither coarse, grannlar, or very compaet, and perbaps porpbyritio.

Second, with respect to geologic age. You are aware that geologists have snhdivided tbe stratified clastic rocks into tbree or four main gronps, to which the following names bave been given: Quarternary; Tertiary, or Cenozoic; Secondary, or Mesozoic; Primary, or Paleozoic.

Certain differences often exist between tbe crystalline rocks that were solidified before tbe heginning of tbe Tertiary period and those that were formed snhsequently, so that the massive crystalline rocks bave hsen divided into *older* and *younger* on this basis, and tbe difference in age between rocks that are sometimes otherwise identical determines tbe application of different names. Tbus quartz porphyry is a rock with compact matrix, bolding disseminated quartz and feldspar crystals, hut erupted hsfore the incsption of the tertiary geological period, wbile qnartz tracbyte is identical mineralogically, hut is of Tertiary or Post-tertiary age.

Thirdly, with respect to tbe mineral composition, which mnst always he the most important element in tbe determination of a rock, I bave already explained tbe distinction hetween essential and accessory mineral constituents; tbe essential constitnents being tbose minerals the constant association of which is characteristic for any given rock. Tbus, quartz, ortboclase and mica make granite, and are its essential constituents. If the quartz disappears snd some other mineral, like hornhlende, takes its place, tbe rock ceases to be granite and hscomes syenite, and so on. While these tbree minerals *must* always he present to form a granite, a great many otber minerals *may* occur at one locality or another, present in very small quantity, which evidently have nothing to do with the great mass of the rock. As many as 44 sucb minerals, some of them very rare, occur in this way in granite.

It certainly mnst seem atrange to yon, it always does to me, that two or three minerals snch as we find in granite should so constantly associate themselves together over snch large areas, and, in fact, in totally disconnected rock masseein widely separated portions of the earth surface. Thus, granites from the Ural mountains, from Germany, Cornwall, in England, from the Rocky mountains, Sierra Nevadas, from Sonth America and from Cbina, all sbow precisely the same composition; in fact, specimens from these widely separated localities might have come off the same rock mass.

Now, of tbese tbree elements, texture, age and mineral composition, tbe consideration of which ie necessary before we can give the correct name to most rocks, *texture* is determined hy unaided eye, *age* hy study in the field, *mineral composition* by tbe microscope. You see, tben, how considerable tbe work that is generally necessary, and, furtber, bow impossihle tbat the ordinary miner, for instance, shonld ever become able to correctly determine and name tbe rocks tbat he meets.

Composition of Common Rocks.

I will now present to you, witbout detailed comment, however, a tahle showing tbe most common rocks only, with their composition. I will commence with tbe crystalline:

Crystalline.—Simple: Limestone, dolomite, gypsum, quartz sbist, chlorite sbist, talc sbist, serpentine (ore-rocks are omitted).

Composite Massive Rocks.

		Younger	Older
Glassy.	Cryptocrystalline and porphyritic.		Cryptocrystalline and porphyritic.
	Macrocrystalline.		
Obsidian	Granite.	Quartz Trachyte. Quartz Sanidine Matrix	Quartz Orthoclase Mica. Quartz Orthoclase Matrix
	Syenite.	Trachyte Sanidine Matrix	Quartz Porphyry. Orthoclase Hornblende. Orthoclase Porphyry. Orthoclase Matrix
Pearlite	Diorite.	Hornblende Andesite. Plagioclase Hornblende Matrix	Hornblende Porphyrite. Plagioclase Hornblende. Hornblende Matrix
	Diabase.	Augite Andesite. Plagioclase Augite Matrix	Augite Porphyrite. Plagioclase Augite. Augite Matrix
Pumice.	Olivine Diabase.	Basalt. Plagioclase Augite Olivite Matrix	Melaphyr. Plagioclase Augite Olivite. Plagioclase Augite Olivite Matrix
Tachylite.			

Shistoid.—Gneiss, granulite, mica shist, clay mica sbist, itacolumite.

Clastic Rocks.—Conglomerates, hreccias, tufas, sandstones, sbales, clay slates, clays.

Genesis of Rocks.

A sketch of the rocks would barely he complete without some account of tbe way in wbicb they were formed. Tbis matter, bowever, has not yet taken sufficiently definite shape, even in tbe minds of scientific men, to enable me to give you a simple and straightforward account of it.

As yon are aware, perbaps, no field of science bas been tbe scsne of more hotly contested strife than tbis—tbe genesis of tbe composite crystalline rocks. From tbe time of Werner and De Saussure almost to tbe presant day, the two great factions, the Neptunists and tbe Plutonists, tbe one advocating the exclusive agency of water and the other, of heat, have stood firmly against eacb other, often waging tbe contest with the bitterness of apparently deadly enmity. The aqueo-igneous theory, which calls into simultaneous action hoth agencies—water and beat—bas furnisbed a middle gronnd tbat for many rocks may prove nearer the truth tban either of tbe others. Tbe revelations of the mioroscope within recent years are certainly throwing a great amount of light upon the questions that have heen so long unsolved.

I will sum up, in conclusion, in very few words, what is most generally accepted hy the best scientific men concerning rock—genesis:

Tbe formation of the clastic rocks is, of course, very simple. Tbe processes go on nnder our very eyes. The conglomerates and gravels are river-hed and sea-shore formations, or more rarely, subaerial inland formations. The sandstones are also sea-cosst formations, while the clay slates, marls and limestones are deep-water deposits, such as we now find going on in most sea and ocean bottoms.

The formation of the crystalline shists is more douhtful. They may he the product of tbe metamorphism of clastic sedimentary rocks at great depths, consequently under great pressnre, witb the aid of heat and water, or, inasmuch as tbey are the oldest stratified rocks with which we are familiar, they may have crystallized out from the bot hnt cooling watere of the original ocean when the temperature of the water was snfficiently bigh (much above its present boiling point) to enable it to dissolve the mecbanical sediments that were carried into it from the snrrounding land.

Massive Crystalline Rocks.

Coming now to the massive crystalline rocks, the macrocrystalline rocks, like granite, bave undouhtedly crystallized out extremely slowly and at great depth, from a condition of aqueo-igneous fnsion, evidence of which are: The large size of the mineral grannles, proving slowness of growth; the liquid cavities, proving tbe presence of water; tbe little bnbhles contained therein, proving elevated temperatnre; tbe

liquid carbonic acid contained in some of the cavities, proving tremendous pressure, whence depth below the surface at which solidification took place.

Whenever granitic rocks exist at the present time at the surface of the earth, a vast denudation of the superincumbent rocks must have taken place, in order to expose them.

The crypto-crystalline and porphyritic older rocks have likewise solidified from a condition of aqueo-igneous fusion, but more rapidly and at a higher temperature, and nearer the surface, for the grain is very much firmer, hence rapid cooling; both liquid and glass cavities are present, hence higher temperature; and no carbonic acid cavities are found, hence lower pressure.

The younger rocks we see erupted from the active volcanoes of the present day. They contain few liquid cavities, large numbers of glass cavities, and carbonic acid is evolved as a gas in enormous quantities from the same volcanic vents. They, with obsidian and such glassy rocks, are the product of nearly pure igneous fusion.

Settling the Debris Question.

A conference was held at Marysville last week between the debris and anti-debris men, with a view to the settlement of the difficulty between the farmers and miners, as far as the dam-building proposition went.

Smith and O'Brien made this proposition as a basis of the settlement of the debris difficulty: The mines will, within 30 days from an agreement, begin the construction of a stone dam in the Yuba river, at Rose bar, just above Smartsville, and 26 miles, by the river, above Marysville. The river at this point is 300 ft. wide, with high, precipitous walls of rock. A strong, wooden crib will be first bolted immovably to the bedrock, and then masses of rock will be blasted in from the banks above the crib to form a solid bedrock dam. The miners will engage to spend $200,000 on the work, and to build the dam 80 ft. high in the first year, increasing its height as necessity may require. They will engage to hold back all the debris, so that the water will not carry it in suspension over the dam. If the dam should fail of its object, they will cease dumping debris into the river, or if one stone dam be not sufficient, they will construct other supplementary dams of brush or other materials. They might agree to place in Col. Mendell's hands a fund for this work, to be expended under his direction.

The intention would be to raise the stone dam at Rose bar to a height of 200 or 300 ft., thus making available for irrigation the whole flow of the river, 40,000 inches at its lowest stage. This water would irrigate a hundred or a hundred and fifty thousand acres of the plains and foothill lands, greatly increasing its value. It was with a view to control the water for irrigation that the miners lately pre-empted 10 miles of the river bed, above Smartsville, to be used as a reservoir.

The miners, further, are willing to introduce in the next Legislature a bill to compel all the hydraulic companies on the Yuba to pay a pro rata tax on the dam, and also to compel the hydraulic miners, wherever practicable, to build dams in the ravines and canyons to prevent the flow of debris into the river.

The proposition as above outlined was discussed at length. The anti-debris men insisted that the miners must cease discharging debris into the river pending the construction of the dams. To this the mining representatives could not consent, and no settlement was reached. Negotiations, however, according to the Nevada *Transcript*, are not yet ended, and correspondence is to follow. O'Brien says that if all the mines now running should be stopped by injunction, all the water available would still be used in hydraulic mining, as there are 20 mining claims lying idle and undeveloped for want of water to one now in operation. These new mines would send down six cubic yards of material where the deep gravel mines now working send down one cubic yard. He contends that the mines never can be stopped by injunction, as injunctions are laid on men, not on mines, and that as fast as one set of men are enjoined, the new men will step in and resume the work.

The flagstaff which surmounted the car of state at Candelaria on the Fourth of July caught on the ground wire of the Nevada and California Telegraph Co., while passing under it on Northern Belle street. The result was a broken wire and flagstaff, and the cause of an accident which resulted in the death of Robert J. Jones, Superintendent of the Northern Belle mill and mining company. He was driving over the old quartz grade, on the north side of the hill, when the team, a very spirited one, struck the prostrate wire, became frightened and ran away toward the hoisting works of the company. Just at the ore dump the buggy ran against a rock, and the sudden movement threw Mr. Jones out of it upon the ground. He received injuries from which he soon after died. He came to this coast in 1852. He lived a long time at Wet Ravine and Forest City, in Sierra county, California, and afterward went to Monte Cristo, Downieville and neighboring places, in which vicinity he lived for over 20 years, following his favorite occupation of mining. About seven years ago he removed to Tyho, Nevada, and from there went to Columbia district, and was at first foreman under Superintendent Woodcock, succeeding him at the head of the mine and mill.

Useful Information.

Healthfulness of Various Mechanical Pursuits.

Miners, says a contemporary, though rarely working more than six hours a day, seldom attain the age of 40. Smelting is considered a most fatal occupation. The arsenic in quick silver mines is very baneful to the workers. Many of the miners are destroyed by bronchitis from inhalation of dust.

The life of a miner, at best, is a hard one. Often bent for hours in a constrained and unnatural position, inhaling noxious gases and dust, and absorbing, as they do, in mining metals, violent and dangerous poisons, and added to that, the perpetual dread of explosions, fall of roof, outbreaks of water and fires, it is no wonder that their average life is less than 40.

Some years ago, a fire took place at Avondale, Pa., in the only shaft by which egress from the mine was possible, and many miners shut up below suffered horrible deaths. Some barricaded themselves in a passage of the mine, and, stuffing with their clothes chinks in a dividing wall, sought to keep out the noxious gases and approaching death. But all in vain! Their wives and children gathered about the pit's mouth, after the fires had burned out, to see brought up the charred remains of those whose toil had earned the pittance and kept them in bread.

The smelting of copper, zinc, brass and lead is accompanied by the most deadly fumes, and working of these metals is also very unhealthful.

In the pointing of needles by dry grinding the workers are soon affected by cough and purulent and bloody expectorations. The same dangers are experienced in the grinding of cutlery. Accidents frequently occur, and the workers are afflicted by what is known as the "grinder's roe."

Notwithstanding the improved machinery used, the evil effects of factory labor are very marked. The worker in textile fabrics—that is, cotton, wool, linen, etc.,—suffers from the effects of dust soon after entering the workroom, which causes continual tickling in the throat, and incites hard coughing. The first premonition is pain in the breast, with obstinate debility and loss of appetite; white viscid matter is expectorated with difficulty, for several hours after work, and under the microscope this sputa shows plainly that it is cotton fibre. The special influences that operate for the production and aggravation of pulmonary diseases exist in this industry to a degree that obtains in no other. The average length of life in this occupation is 28 years.

Those engaged in the manufacture of wall-papers and artificial flowers, especially where arsenical green is used, speedily show the ill effects of their employment. So do the makers of lucifer matches; the phosphorus required in their composition first attacks and ruins the teeth.

Painters and color-mixers absorb metallic poisons through the skin and respiratory organs, which subject them to frequent disorders of the lungs, stomach and nerves.

Emery Paper.

In applying the emery paper for very fine work use at first No. 1 paper both along and across the work, and repeat the process with No. 0, No. 00, No. 000, or No. 0000, according to the polish required, bearing in mind that the more the emery cloth or paper has been used the finer is the polish it will give, the reason being that it becomes coated with a glazed surface, composed of particles of the metal it has been rubbing; and all metals polish finer and brighter with such a surface than with any other. If the above grades of emery cloth or paper cannot be readily obtained, take the finest grade at hand, and wear it down by using it on a rod or piece of metal in a lathe at a high speed, wiping the rod once during the latter part of the operation with a piece of rag or waste, slightly oiled, which will cause the oil to pass to the emery paper, and the latter to retain the particles of metal upon its surface. If this method of polishing be carefully executed, the work may be kept very true and even, and possess a finer finish and polish than by applying oil-stone or by any other known method.

Before commencing any piece of work, measure it all over; and if it has a rectangular part, apply the square to it so as to be assured, before any work has been done to it, that it will clean up to the required dimensions.

Lime in Brass Tubes.—In districts where water is largely impregnated with lime, iron tubes will not answer for locomotives. Lime is quickly deposited on the tubes, and it adheres much more strongly than it would on brass tubes, using the same water. In brass tubes a thin scale of one-sixteenth to one-eighth inch thick would be formed, while the incrustation about the iron tubes would, in a few years, completely block up the water space between the tubes. When this takes place it is impossible to keep the tubes at the fire-box end tight. To prevent the sediment from adhering to the iron, paraffine oil is recommended, even where brass tubes are used. About three pints for every 1,000 miles run, put into the boiler the evening before washing out on the following day, is mentioned as the quantity. Being free from acid, this oil is safe to use.

Restoring Engravings.

It is a great mistake to bleach an old engraving with chloride of lime and oxalic acid, or either one of these chemicals, as has been done. If such powerful bleaching agents are employed, they should be used very cautiously, as will be indicated further on. The "old" appearance of an engraving is one of the things that it should possess, and it is bad taste to attempt to rejuvinate it to make it appear like a new print. The only treatment that an old engraving should receive is careful washing in pure cold water. This, if properly done, will remove from the print all that ought to be removed—dirt, dust, fly specks, and the like. To do this properly, a piece of ordinary mosquito-netting should be taken, large enough to accommodate the print, and the ends stitched over so as to allow of the insertion of a stick of wood (a section of a broomstick will answer), to serve as a convenient holder. The print should be laid flat on this, immersed in a bath of clean water, and from time to time moved to and fro under a gentle stream of water directed upon the soiled places. The mosquito-netting will serve to support the paper and prevent its tearing. If left long enough in the water, and carefully handled in the manner described, the dirt, dust and specks will be found to be very effectually removed, and the print very much improved in appearance. If the paper is much defaced with yellowish or brownish spots—a characteristic which is very common to old English prints—it may be advantageous to apply chloride of lime carefully with a camel's-hair pencil to one spot after another, watching its effect closely, and washing off immediately in a stream of water; and thus pencil out the spots until the paper has a uniform tint, commencing at the unimportant places to get into the right way of doing it, and working cautiously up to the important places. This, however, is only a suggestion. If former treatment has injured the surface of the paper, which is very likely, it may perhaps be improved by going over its surface with a very dilute starch solution, and afterwards calendering the paper by passing through a copper-plate printer's press, which may restore the surface and give the print a more lustrous appearance. But this we will not vouch for, and only offer it as a suggestion. —*Manufacturer and Builder.*

Esparto Grass Paper.—The first works for manufacturing paper from esparto on the Continent are being erected at Barnburg, Germany, by a company of French and Hamburg capitalists. The works, it is said, will be ready next September.

Good Health.

The Nervous Economy in Man and Insects.

Mr. Grant Allen writes in *Knowledge* that the nerves (worth mentioning) in the human body which are not under the control of the brain are those of the heart and other internal organs; and over these parts, as everybody knows, we have not any voluntary power. But all our limbs and muscles are moved in accordance with impulses sent down from the brain, so that, for example, when I have made up my mind to send a telegram to a friend, my legs take me duly to the telegraph office, my hand writes the proper message, and my tongue undertakes the necessary arrangements with the clerk. But, in the insect's body there is no such regular subordination of all the parts composing the nervous system to a single central organ or head office. The largest knot of nerve matter, it is true, is generally to be found in the neighborhood of the sense organs, and it receives direct nerve bundles from the eyes, antennæ, mouth, and other chief adjacent parts; but the wings and legs are moved by separate knots of nerve cells, connected by a sort of spinal cord with the head, but capable of acting quite independently on their own account.

Thus, if we cut off a wasp's head and stick it on a needle in front of some sugar and water, the mouth will greedily begin to eat the sweet syrup, apparently unconscious of the fact that it has lost its stomach, and that the food is quietly dropping out of the gullet at the other end as fast as it is swallowed. So, too, if we decapitate that queer Mediterranean insect, the praying mantis, the headless body will still stand catching flies with outstretched arms, and fumbling about for its mouth, when it has caught one, evidently much surprised to find that its head is unaccountably missing. In fact, whatever may be the case with man, the insect, at least, is really a conscious automation. It sees or smells food, and it is at once impelled by its nervous constitution to eat it. It receives a sense-impression from the bright hue of a flower, and it is irresistibly attracted toward it, as the moth is to the candle. It has no power of deliberation, no ability even to move its own limbs in unaccustomed manners. Its whole life is governed for it by its fixed nervous constitution, and by the stimulations it receives from outside. And so, though the world probably appears much the same to the beetle as to us, the nature of its life is very different. It acts like a piece of clockwork mechanism, wound up to perform a certain number of fixed movements, and incapable of ever going beyond the narrow circle for which it is designed.

The Removal of Scars and Cicatrices.

The *Journal of Pharmacy* furnishes from good sources the following hints on this topic: The cicatrices, scars, or marks left by various diseases, burns, or wounds of divers kinds, are often less obstinately permanent than is generally supposed; and from some facts which have lately come under our notice, we are inclined to think that their prevention or removal in many cases may be accomplished by some mild but effectual antiseptic.

Among the exemplifications of the efficacy of the formula we are enabled to lay before our readers is the case of a gentleman of our acquaintance, whose face was so severely burned by the violent spurting of a quantity of melted lead (owing to a workman having incautiously dropped a wet pipe into it), that his eyes were only saved by pebble spectacles from utter destruction.

At first, of course, carron oil was the sole application; and, as for weeks afterward particles of the granulated metal had literally to be dug out of the flesh, a deeply-scarred countenance was naturally predicted by all, except the patient himself. One mark, of an almost imperceptible character, alone remained after the expiration of 6 months, owing, as our friend says, to the whole face being bathed 2 or 3 times a day, as soon as the oil treatment could be discontinued, with a lotion of the simplest character, as is readily seen by glancing at its constituents.

Lint soaked in the same solution, and allowed to remain on some little time, will frequently mitigate the visible results of small-pox, and we have known one case of ringworm treated in this way to leave no scar whatever, while a sister of the latter patient, who had had the same disease in a lesser degree, but had not employed this lotion, still retains the evidences of the fact. The following is a convenient formula for a wash: Borax, ½ ounce; salicylic acid, 12 grains; glycerine, 3 drachms; rose water, 6 ounces.

Rare-done Meat Injurious.

There are no indications that the mania for undercooked beefsteaks is on the decline; in restaurants only such are served. This refers to robust people, but weakly persons continue to patronize pounded raw chops and steaks, and the juice of uncooked meat. M. Toussaint exposes the grave dangers of patronizing such a dietary, as, if the meat is unsound, the germs of disease will inevitably pass into the system. He states no contagious malady possesses greater virulence than tubercular affections, or consumption, and that is the form of the disease most to be encountered in meat sent to the market. In the slaughter-houses, an ox, etc., is not rejected as unfit for food, unless the lung be entirely affected, but gray granulations may still exist and produce infection.

M. Toussaint took the lung of a cow not very much affected with consumption; he placed it under a press and collected the juice; he inoculated rabbits and young pigs with the liquid as it came from the press, and after he had heated another portion to 114° Fahr., the result was, all the subjects died within a very short period. He extracted the juice in the same manner from the thigh of a pig, dead from consumption, previously cooking the flesh, to correspond with that served in hotels, etc., according to the latest fashion. Then he inoculated rabbits with such grilled juice, and they invariably died of consumption. There are cases where the consumption of raw meat is necessary; here duty suggests to ascertain well the origin of such meat; in all other cases it is prudent to only eat meats suitably cooked; that is, meat whose interior has been acted upon by a temperature of 150° or 160°.—*Kansas City Science Review.*

How to Treat Sunstroke.—Remove the patient to a shady place at once. Place the body in a sitting posture, the back against a wall, with the feet and legs resting upon the sidewalk, and extended in front of the body. Get ice-water and a bottle of strong essence of ginger. Pour the ice-water upon the head, copiously; never mind the clothes. Then pour 2 or 3 tablespoonfuls of ginger in about half a tumbler of water, and make the patient swallow it quickly. Keep the head cool by using a little of the ice-water, and in case there is not much of a glow upon the body, give more ginger. If the directions are followed, there will be no occasion for the services of an undertaker. Ginger is far the best to use, but where it cannot be had quickly, 2 or 3 glasses of brandy will answer the purpose.

The Best Foods.—Wholesome, nutricious foods—those that supply the system most readily with what is required to give it vigor and endurance—are those foods that are cheapest and most generally distributed over the earth. These are the cereals and other direct products of vegetation. There is as much nutriment in one pound of beans, wheat or rice as there is in three pounds of beef, mutton or poultry. There is not a sturdier race of people on the earth than the Chilians, nor a race capable of greater physical endurance. This fact has again been demonstrated in their late war with Peru and Bolivia; a war waged against vastly superior numbers and possessing far greater wealth, yet the Chilians conquered them in their own homes.—*Journal of Health.*

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Improved Winding Gear for Mines; Academy of Sciences; The Education of Mechanics, 49. Passing Events; Steam Engineers; Steel Works for Oakland, 56. Classification and Rules of the Denver Exposition; California's Commissioner to Denver; Mine Ventilation, 57.

ILLUSTRATIONS.—Arrangement of Winding Gear for Mines, 49 Struve for Mine Ventilation; Air Current from Steam Jet. 57.

CORRESPONDENCE.—Mining Law Once More, 50.

MECHANICAL PROGRESS.—The Mechanic Arts; Copper Bearings; New Resisting Alloy; Improved Winding Gear for Mines; A New Water Elevator; The Holding Power of Brass Tubes in Tube Plates; Instantaneous Formation of Steam, 51.

SCIENTIFIC PROGRESS.—The Royal Society of London; The Wonders of an Atom; Crystallization of Metals by Heat; Spontaneous Combustion in Process of Drying; Prof. Proctor on Astrology and Superstition; Artificial Soil. 51.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends. 52

MINING SUMMARY from the various counties of California, Nevada, Arizona, Montana, Idaho, New Mexico, Oregon and Utah, 52 3

USEFUL INFORMATION.—Healthfulness of Various Mechanical Pursuits; Emery Paper; Lime in Brass Tubes; Restoring Engravings, 55.

GOOD HEALTH.—The Nervous Economy in Man and Insects; The Removal of Scars and Cicatrices; Rare-done Meat Injurious; How to Treat Sunstroke; The Best Foods, 55.

Business Announcements.

Dividend Notice, Eureka Consolidated Mining Company. Machine Work, W. H. Ohmen, San Francisco.

Passing Events.

There is nothing specially worthy of note from the mining regions this week other than we have mentioned in the columns of our mining "summary." In fact, affairs in the mines are very quiet just now, there being no particular "excitement" in any direction. Preparations have been made quite extensively in Arizona and Utah for representation at the Denver mining exposition, but in this State and Nevada very little has been done.

Nothing has been done in the matter of the debris conference. In this connection, the following paragraph from the Grass Valley *Union* is suggestive: Some of the valley people hold back from coming to terms with the miners from a fear that the proposed dams may be insufficient. It may be taken for granted that when the miners say they will build dams that will impound the debris, they mean that they shall be such structures as will stand, and such as will pass the inspection of the best engineers. When the miners go into the dam-building business they will feel as much interest in their subserving the purpose intended as will the farmers. There is no shoddy work contemplated.

In another column we make some quite extended remarks on the subject of the establishment of steel works on this coast. Oakland citizens are striving to get them established there, and the Sacramento people are also trying for the prize. Such works as those contemplated will disburse large amounts of money and form one of our most prominent industries.

THE Manzanita Hydraulic Mining Co., whose claim is just at the edge of town, says the Nevada *Transcript*, of July 18th, are now making their first regular cleanup for the season. They had taken out something like $20,000 up to yesterday, and were only part through. The mine is now paying better than ever, we are told.

Steam Engineers.

There is probably no class of men to whom a technical education is more necessary than to steam engineers, and at the same time, there is probably no class more generally ignorant of the principles and details of their profession than engineers, as a class. There are men who have had charge of steam engines and boilers for years and years, who run them every day, and all day long, who but dimly understand the principles, either of the construction or operation, of the mighty machines over which they assume charge. Some few of them, with a laudable desire to improve themselves in this respect, fly to books on the subject for aid, but are met on the very threshold by pages and pages of algebraical formulæ, "Thermal Equivalents," "Laws of Thermodynamics," Isothermal and Adiabatic curves (very useful things to those who can understand and apply them), but which to these men are as meaningless and useless as so much Greek or Latin. Disappointed and disgusted, they put the book away, and make no further effort to go on in their pursuit of knowledge.

It is a well-known fact that the great majority of those who run steam engines are men of rather limited education—the three R.'s representing about their sum total in that respect—and hence a book, to be of any particular value to them, must, of necessity, be written in language which they can understand, and not in a mysterious beyond their comprehension.

The want of a proper education on the part of these men is something to be deplored; but it must be remembered in their behalf that many of them, when boys, were driven by poverty to go out into the world and battle for bread, when they should have been, by right, at school, getting that greatest of all blessings—a good education. In order, then, to be useful to them, books intended for their education must be written in the plainest and simplest language, so that it can be easily understood by those for whom it is intended—the worthy seekers after "more light." To those "runners" who scout all book learning—the "rule of thumb" men who imagine, in their ignorance, that what they don't know about steam and steam engines is not worth knowing, books of any kind are, of course, useless.

Simple works, however, which give the general principles governing the use of steam, may be found useful to a very large class, indeed. The marine engineer, locomotive engineer, stationary engineer, be who runs the fire engine and thrashing machines, can always learn from the experience of others. A complete knowledge, or at least a more thorough understanding, will always enable those who own or use steam power to exercise an intelligent supervision over their steam machinery and those whom they employ to manage it. What is ordinarily known as book knowledge can but raise the *status* of engineers (the men who *run* the steam engines), and their own experience will always enable them to judge between mere theoretical ideas and those which are practical and worth application.

In another column of this number of the PRESS, we refer briefly to a new work intended for the use of steam engineers, which seems to cover the ground better than any we have yet seen. An engineer needs to read, study and advance himself in his business. The trade is a progressive one; new facts are daily being discovered in the employment of steam and adaptation of steam machinery and appliances. He who professes to be a steam engineer and does not make an effort to keep informed as to the new developments in his profession, will find his usefulness growing beautifully less, and his services valued accordingly.

On the other hand, the unskilled coal shoveler, who applies himself to study and research to acquire a practical knowledge of steam engineering, will generally qualify himself for a steady position and good wages.

Employers are very often much to blame for engaging a cheap, incompetent class of men to run their engines and boilers without regard to their fitness. They are too much inclined to regard wages as of the greatest consequence in deciding whom to employ.

It is almost useless for engineers to try and educate the whole class of steam users as to the danger and pecuniary loss involved by employing ignorant, unskilled men to manage their boilers and engines. Some progress may be made with the earnest co-operation of the engineer's press, but the task will never be fully accomplished. All that can be done, therefore, is to place within the reach of mill owners, superintendents, and other "bosses" (as well as engineers and firemen), the means by which they may intelligently supervise the steam, as well as other departments under their charge.

THE discovery of the correlation of force, as Grove called Rumford's law, was followed by the discovery, by Helmholtz, of the conservation of force. The two together constitute the law of force or energy as known to-day. Under it we are taught that force, when manifested in one form, becomes changed into another, and that while the quantities of the various forces are constantly varying their sum remains unaltered. It follows from the law of the conservation of force that force cannot be created and that perpetual motion is therefore an absurdity.

Steel Works for Oakland.

The California Iron and Steel Co. are about to erect steel works, blast furnace, etc., either at Oakland or Sacramento, which is is not yet decided. The steel works will have a capacity of 80 tons per day, and the blast furnace of 50 tons per day, and it is generally considered that, if these works are built in Oakland, it will establish that city as the great iron center of this coast. Considering that the town has the Judson Manufacturing Co.'s works (formerly the Judson Nail Co.), which are in course of erection at Emory station, the Pacific Nail Works, which will be in operation by October 1st, 1882, and the Oakland Iron Works, Ives Scoville & Co., recently rebuilt and enlarged, the expectation is not unwarranted. The pay roll of the California Iron and Steel Co. and the Judson Manufacturing Co. combined amounted to $18,000 in June, and will be increased to $24,000 for the month of July.

The following proposition has been made by the California Iron and Steel Co., viz.: That if the citizens of the above-named places will subscribe for 6,000 shares of the capital stock of the California Iron and Steel Co., at the rate of $25 per share, nominally valued at $100 each, the company will erect their blast furnaces and steel works at Oakland.

The California Iron and Steel Co., Egbert Judson, President, is an incorporation with a capital stock of $2,675,000, divided into 26,750 shares. The company owns property, consisting of 9,100 acres of timber land, the Clipper Gap iron mines, and furnace and other improvements at Hotaling, Placer county, aggregating the sum of $432,115.45, all of which is fully paid for. Of the capital stock 15,990 shares have already been sold, leaving 10,760 shares yet to be disposed of. Of this remainder the company offers for sale 6,000 shares at the rate of 25% of their par value, the remaining 4,760 shares being already conditionally placed. The amount of money to be realized from the sale of these 10,760 shares will be expended by the company in the construction of a blast furnace and steel works, to be located at Oakland, provided that the 6,000 shares shall be subscribed for by the citizens of the place above mentioned. The city of Sacramento is also making an effort to secure the location of the works there.

Those who subscribe for the capital stock of this company, not only acquire an interest in the steel works proposed to be built, but also an interest in the whole plant of a company that is in successful operation on a large scale, working its own mines and producing pig-iron of an excellent quality, the demand for which is greater than the supply, and which is to possess the qualities indispensable for the manufacture of steel. It is needless to refer to the great advantages that would accrue to the manufacturing interests of these two cities if this enterprise should be located within their vicinity. In the manufacture of various kinds of machinery a large amount of steel castings is being constantly used, all of which are shipped hither from Pittsburg or other iron centers, at a great expense of transportation. It would give a remarkable impetus to the growth of the iron industry in all of its forms, since the production of steel here in our own market would enable manufacturers of all kinds of machinery to more successfully compete with the world for the trade of the Pacific coast.

The Business Men's Association, of Oakland, appointed a committee, which has made a careful examination into the details of the business of this company, present and prospective, and feels assured that all who are now, or who may become its stockholders, may reasonably expect this to be a paying investment, and we hope that the amount of stock offered will at once be taken, and the location of these works secured for Oakland, or its immediate vicinity.

At the meeting of the Executive Committee of the Business Men's Association, in Oakland, Mr. Irving M. Scott, the well-known foundryman, said that he knew of no better location in the State than Oakland for the steel works. Sacramento was bidding for these works, and it would be difficult to beat her. He had been interested in the introduction of manufactures in this State for 20 years. Most of us had burned our fingers in stocks, but now a new era was coming. Some three or four years ago, he had taken hold of an iron mine in this State, rather unwillingly at the time, and he had been very conservative in the work at first. It was with difficulty that he had induced the Central Pacific Company to take iron from them for chilled car wheels; but finally, after some two or three trials, they had been successful in making a good quality of pig iron for that purpose, and now the company took no other iron. They were now taking some 75 tons of iron a month for their car wheels only from the Clipper Gap works, and they were more than satisfied with the quality. It was better than the best Eastern. This success had induced them to incorporate the Iron and Steel Manufacturing Company. The prospects of the mine improved with every foot it was sunk, and judging from their experimental tests, they would have a profit of some $4 to $5 a ton, as compared with the prices of the imported steel. The tendency of all modern manufacturing work was to substitute steel for iron, and the moment they could show that they could make steel, there would be a market for all they could produce. He was sending every week for tons and tons of steel castings to Pittsburg, and the demand for this quality of work in the mines was very large.

If Oakland, which had already the Judson Nail Factory, would add to it a steel furnace, it could make Oregon, the Territories, the Sandwich Islands, Nevada and California pay tribute to it, for all these places needed steel in quantity. San Francisco could not give the space to a young industry which it needed, and besides, the water frontage could not be obtained. Of course, manufacturers liked to get encouragement from the people, but in any case, people's eyes were being fixed on Oakland as a good location for factories. Water carriage was a great inducement and advantage to manufacturers, for the raw materials were costly to transport by land. The time had come when San Francisco and Oakland must be manufacturing cities or nothing. What will be the result if we keep on sending away our raw material and bringing back manufactured goods? With the exception of the fuel question, steel could be made as cheaply here, or cheaper, than in the East. They had found that at Clipper Gap they could get charcoal nearly as cheap as in Georgia, which is the cheapest place for it in the United States.

The iron ore and pig-iron at the mine at Clipper Gap cost less than it did at Pittsburg, and the difference in our favor in this item would more than counterbalance the extra cost of coke for the steel furnace. The profit of making steel was enormous, for the difference between the price of steel and pig-iron was some six or seven cents a pound, while the cost of turning the pig-iron into steel was about a cent a pound. If there never was another railroad line laid down in the State, the two now in operation would absorb as much steel as two such furnaces as they proposed to put up could manufacture.

It is mainly a question of the cost of fuel; I think Oakland is a better place than Sacramento. There is no better climate, on an average, for work than that around the bay. Yet the climatic peculiarities of Sacramento had not affected the amount of work done as much as he had expected. The price of coal and coke would be about a dollar a ton more in Sacramento than in Oakland. He thought that San Francisco bay was bound to be the great center to which all the ores of every description would come. In this particular instance it was a question which city—Oakland or Sacramento—would put up the money first, and it was a race between the two cities. There was a sufficient market in Sacramento, at the railroad works, to take twice as much steel as the furnace they meant to put up could make.

Mr. Chamberlain said that he had seen Mr. Stevens, the master mechanic of the Central Pacific Company, and Mr. Watson, at Sacramento, and had asked them if the steel works were located at Oakland would the railroad company still purchase from them, and they had said yes. That circular emanated from the Sacramento people. They had come to the Steel Works Company and had asked them if the citizens of Sacramento would subscribe the 6,000 shares mentioned, would the company locate the works there? They had answered that they would do so, and it was a question now which city would subscribe the money first. The erection of steel works was an assured fact, and the only question remaining to be settled was the location. He then went into figures, showing the probable profits of steel-making. There was now invested in the Clipper Gap Works about $450.000, and with a further expenditure of $250,000 for a steel furnace, he expected that the net profit of the mine, the pig-iron and the steel works would amount to $2,000 a day. The Central Pacific railroad would take from them 12,000 tons of steel ingots yearly. Steel works added to the Clipper Gap Works would pay dividends on the entire capital stock of 10% per annum.

Mr. Scott incidentally mentioned the fact that there was now in the Benicia arsenal a requisition for some of the Clipper Gap iron, which they meant to test for the casting of big guns for the Government.

THE DUTCH FRED MINE.—Doubtless most of our readers, save the Homer *Index*, have heard the story of the remarkably rich gold rock discovered some years ago by "Dutch Fred," who was murdered by his partners because he would not conduct them to the plant. The murdered man was buried in Horse meadows, between Lee Vining creek and Bloody canyon, where he fell. An old prospector who saw much of the rich rock (worth about $60 per pound) in Dutch Fred's possession, and who studied his character closely, informs us that he has never seen any quartz of precisely the same character on either side of the Sierras except at one spot in Parker canyon, Prescott district, and that this spot or lode is owned by Peter Marks, of this county, and Mr. Snow, of Little Yosemite. Last season Marks started a tunnel into the mountain on the ledge, finding much coarse gold at the point of starting, but the gold became finer as he drove in and the rock was not so rich. Just below the mouth of this tunnel, and on the line of the lode, is a peculiar formation, resembling the site of an old shaft filled with a peculiar clay closely resembling that associated with the rich rock found by Dutch Fred, and on examining the spot a few days since, the old prospector in question informed Mr. Marks that he believed that was the identical old shaft from which Dutch Fred had obtained his rich rock. Mr. Marks at once resolved to sink a shaft on the spot, and is now engaged in the work,

Classification and Rules of the Denver Exposition.

The following is the official classification of the Denver Mining and Industrial exposition:

Classification.

Department A.—Mineralogy: Class 1, gold ores; class 2, silver ores; class 3, iron ores; class 4, lead ore; class 5, copper ores; class 6, fire, potters' and other clays; class 7, bituminous coals; class 8, anthracite coals; class 9, cannel coal; class 10, lignite; class 11, other metaliferous specimens not enumerated above.

Department B.—Geology: Class 1, marbles; class 2, lithographic stone; class 3, limestone; class 4, miscellaneous building stone; class 5, fossils, class 6, gypsum; class 7, precious stones and crystals; class 8, native chemicals.

Department C.—Hardware, edge tools, cutlery, and all cast and wrought iron goods, including stoves, safes and metallic household utensils.

Department D.—Metallurgical machinery.

Department E.—Agricultural and horticultural products and floral displays.

Department F.—General machinery, including steam engines and machine tools.

Department G.—Agricultural and horticultural implements and machinery, carriages, wagons and other vehicles.

Department H.—Textile fabrics, leather and their products.

Department I.—Household goods, watches, jewelry, ornamental articles, optical and scientific instruments, ceramics, etc.

Department K.—Liberal arts, natural science and education.

Department L.—Food preparations and miscellaneous articles used in domestic economy, miners' supplies, etc.

Department M.—Chemical and medicinal preparations (patent medicines excepted) illuminating and lubricating oils.

Department N.—Miscellaneous unclassified articles.

Rules.

1. The building will be open for the reception of articles on and after July 15th, and all exhibits must be in position, and machinery ready for operation on the opening day.

2. Machinery and manufactured articles must be entered in the name of the manufacturer. Entries will be permitted by manufacturer's agents. Mineral specimens may be entered by mine owners and through their accredited representatives.

3. The driving engines will be ready to furnish power to the main shafts ten days before the opening, free of charge; but exhibitors must make their own attachments.

4. The entry clerk will furnish each exhibitor with an original and duplicate tag, the duplicate to be securely attached to the article exhibited when it is placed in position, the original will be kept by the exhibiter during the exposition, and be surrendered to the entry clerk when the articles are removed from the building.

5. All articles on exhibition must remain until the exposition closes. Removal will not be permitted, except upon the written consent of the board of directors. Every facility for making sales of articles, to be delivered at the close of the exposition, will be extended.

6. An efficient police will be provided for the care of articles, both day and night, but exhibits will be entirely at the owner's risk. Insurance against loss by fire will be effected when desired, at the cost of the exhibitor.

7. To preserve harmony in the general effect of the display the board reserves the right to regulate the position of all articles and the size of signs.

8. Space will be allotted in the order of application, and exhibitors notified as early as practicable. But space not occupied, either by the arrival of goods, or otherwise, one week before the opening day will be reassigned by the board.

9. As there will be no charge made to exhibitors, for entries or space, admission tickets will only be furnished to such exhibitor or to one employe, or both, when it is shown that the attendance of the exhibitor or employe is actually necessary. For these tickets five dollars each will be charged. These tickets will be registered, and forfeited if used by any other person than the one to whom they are issued.

10. The board of directors will take charge of all articles upon which the freight is prepaid, and remove them to the exposition building, at the expense of the exhibitor.

11. All unclaimed articles left by exhibitors 15 days after the close of the exposition will be stored and disposed of according to law.

12. All platforms or other temporary structures erected by exhibitors must be removed from the building by them within 15 days after the close of the exposition. No attachments to the floor by nails, screws, or otherwise, will be permitted. This does not include permanent exhibits.

13. There will be three lines of shaftings in Power hall, one 2 7-16 inches in diameter, for light machinery, will be driven at a speed of 150 revolutions per minute. The others will be 2 15 16 inches in diameter, with a speed of 200 revolutions per minute. Driving pulleys, as required, also counter-shafts and pulleys, belts and hangers, will be furnished for exhibitors, at cost, if timely notice is given. They should be ready to be placed on the shafts before the 25th of July.

The custom of awarding premiums has been so freely condemned that it has been omitted here. The action of ignorant or biased jurors will thus be avoided. Exhibitors will appreciate this feature, as it leaves them free to win success among the people, who will prove the claims of inventors by actual tests.

California's Commissioner to Denver.

Mr. W. B. Ewer, the senior editor of this journal, has been appointed to represent California at the Denver Mining Exposition. Receiving his appointment so late, Mr. Ewer has been unable to take any active measures toward making a collection of minerals. Indeed, there being no appropriation for traveling expenses, cases for exhibition, printing labels, etc., it was impossible to do anything in the direction of making a display.

It was thought best, unless California, as the oldest mining State, could make a *fine* display, to make none at all, as from the State. If individuals desire, however, to display any specimens, by forwarding them they will be properly cared for by Mr. Ewer.

It is to be regretted that no means were forthcoming to admit of California making such a display as would do her credit; but, without time or means, it would be next to useless to make any attempt.

Mr. Ewer will leave here in time to be at Denver on the opening day of the exposition. He will publish his observations, and will describe all that may be new or useful for us out here.

Parties desirous of communicating Mr. Ewer may do so by addressing him, care of this office, for the next week. After that he will be at Denver.

The deepest mine in the world, according to Prof. H. Hoefer, of the Academic Imperiale des Mines, is the Pribrand silver mine in Bohemia. The lowest depth is nearly 3,300 feet below the surface. At this depth the temperature of the rocks is only 75.90° F., and the temperature of the mine, according to the same authority, is 76 3° F., so that up to the present only natural ventilation has been required.

The new building at Denver erected for the mining exhibition, is 500 ft. long and 310 ft. wide, and has an area of about 140,000 square feet. It is four miles from the city, but can be reached in 15 minutes by the local railroad. It is the property of an association, and was built with a solidity that will make it permanently useful,

Mine Ventilation.

In recent numbers of the PRESS we have made some extracts from a very interesting article, in the *Colliery Guardian*, on the subject of mine ventilation, written by C. M. Percy, M. E. We take this week two views, showing simple methods of inducing air currents.

Dr. Siemens has constructed a steam jet exhausting apparatus, producing a vacuum of 12 lbs. per square inch, with steam at 30 lbs. above the atmosphere, and has obtained as high a useful effect as in the ordinary steam engine. His appliance was such that a thin annular jet of steam was produced, and this steam acts upon the air inside and outside; and when the steam and air had fairly united, the passage through which the combined mass passes is an expanding paraholic delivery funnel, in which the velocity is gradually reduced, and the momentum of the steam utilized in propelling the air (see Fig. 1).

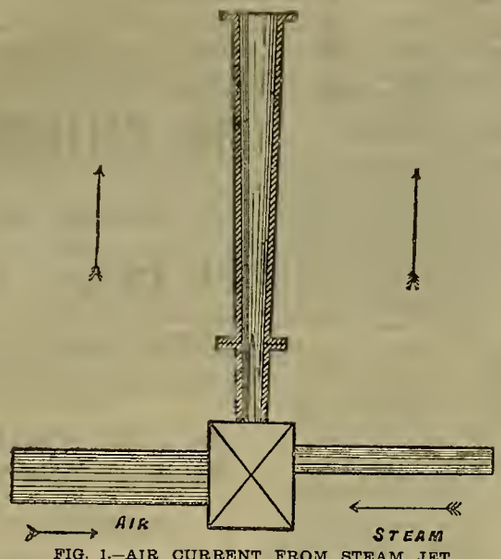

FIG. 1.—AIR CURRENT FROM STEAM JET.

Dr. Siemens was successful in applying the steam jet to the working of pneumatic dispatch tubes, in which, having a length of four miles, a vacuum of 5 lbs. per square inch was obtained from a steam pressure of 40 lbs., and an average speed through a 3-inch tube attained of 14 miles an hour; and also as blowers for his gas producers. But, after all, passing air through a 3-inch tube is very different from dealing with it in a pit shaft 18 ft. or 20 ft in diameter, and having to deal with hundreds of thousands of cubic ft. per minute; and it is not likely that steam jets will ever compete with good machines for effective and economical ventilation. Still, the principles which guided Dr. Siemens in his successful experiments are worth noting:

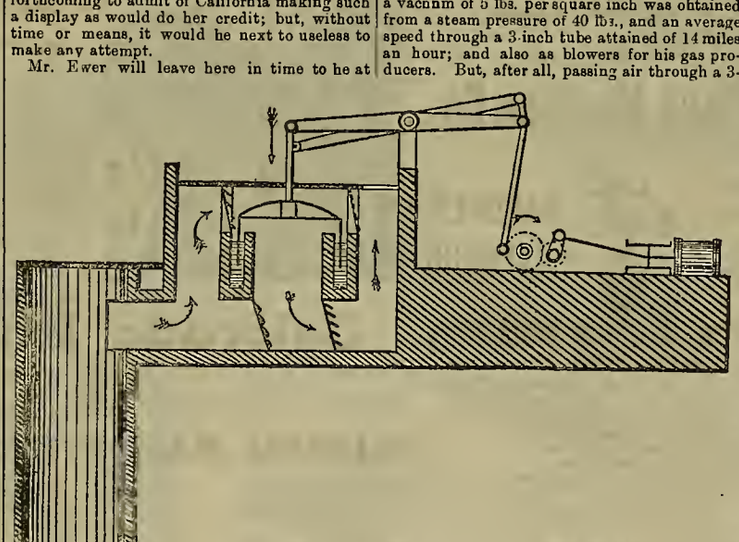

FIG 2.—STRUVE FOR MINE VENTILATION.

1. By gradually contracting the area of the air passages on approaching the jet, the velocity of motion of the entering air is so much accelerated before it is brought in contact with the steam, that the difference in the velocity of the two currents at the point where they come together is much reduced, and, in consequence, the eddies which previously impaired the efficiency of the steam jet are, to a great extent, obviated, and a higher useful result is realized.

2. By the annular form of the steam jet, the extent of surface contact between the air and steam is greatly increased, and the quantity of air delivered is by this means very much augmented in proportion to the quantity of steam employed. Also the great extent of surface contact tends to diminish eddies.

3. By discharging the combined current of steam and air through the expanding parabolic delivery funnel of considerable length, in which its velocity is gradually reduced and its momentum accordingly utilized by being converted into pressure, the degree of exhaustion or compression produced by the steam jet is very materially increased under otherwise similar circumstances. And Dr. Siemens, from his very elaborate and successful experiments, arrived at the following conclusion: (1.) The quantity of air delivered per minute by a steam jet depends upon the extent of surface contact between the air and the steam. (2.) The maximum degree of vacuum increases in direct proportion to the steam pressure. (3.) The quantity of air delivered per minute is in inverse relation to the weight of air acted upon. (4.) That the limits of air pressure attainable with a given pressure of steam are the same for compression or exhaustion.

Although mine ventilation by steam jet can scarcely be pronounced a success, there is really no wonder that efforts have been made to utilize the power of steam in this direction. Dr. Siemens' results, as just referred to, are sufficiently remarkable, and the loco. blast is also strikingly valuable. But we have much more to go upon even than these. Giffard's injector, introduced into England some 25 years ago, took our engineering world by storm. Not only practical men, but authorities on matters of science, scoffed at the idea that water could be forced into a boiler by the direct contact with steam, not only not higher in pressure, but even considerably lower. But there it was, working, in spite of all arguments to the contrary, and now thousands are in operation; and M. Giffard, who has so lately passed away from us, has left behind him the name and memory of a most successful inventor. Shortly after this the principle was applied to purposes of condensation by means of a pair of large barometers made of boiler plates, and similar in construction to ordinary gasholders, each working up and down in a circular chamber of brickwork, the bottom edge of the barometer being immersed in an annular trough of water in the walls of the chamber. At the top and bottom of each chamber are two sets of air-valves, consisting of simple wooden flaps hung upon vertical gratings, which open inwards on the side communicating with the pit and outwards on the opposite side. In the up-stroke of the barometer the air from the pit is drawn in along the passage and enters below the barometer through the bottom inlet valves, while that above the barometer is expelled through the top outlet valves. In the down-stroke the air below the barometer is expelled through the bottom outlet valves, while more air from the pit is drawn in above the barometer through the top inlet valves. The two barometers are worked by cranke at right angles to each other, thus rendering the draft of air from the pit practically uniform.

And, lastly, we have what is likely to prove a greater success than either—namely, the exhaust injector. This has just been named, and at no distant date will demand special description. Here let it suffice to say that an exhaust injector fed with exhaust steam will force, by direct contact, water into a boiler working at a good pressure. No one could be more startled than the writer to have it, upon the highest authority, a few days ago, that not only will this exhaust injector, working with exhaust, overcome steam at a good pressure, but that, working with exhaust at five pounds below atmospheric pressure, it forced water into a boiler at 60 pounds.

Fig. 2 is a struve, and the diagram is so clear that no special explanation is necessary. It is placed beside the shaft, as the engraving shows.

TITLES IN MINING CAMPS.—A man from Montana district, to which there has been considerable of a stampede this year, says military titles in that section are regulated by the extent and value of each titled personage's quartz interests. A 100-ounce vein of quartz entitles its owner to be called Captain; if it increases in width and richness on sinking he is promoted to the title of Major; and if it develops into a genuine bonanza he is given a Colonelcy at once. Our informant had what was generally regarded as a big bonanza and for a time was a Colonel of the first water. He now ranks lower than an eighth corporal. He says that when he had sunk about 12 ft. he was in a fine body of $700 ore. He was good for $500 at any shop in the camp, and the big hugs patted him on the shoulder, and it was "Colonel, can't I do this for you?" or "Colonel, can't I do that for you?" but suddenly the mine petered and there was no more sign of a vein than there is in the middle of Main street, and then it was "Oh, you pimple-nosed old bloat, you'd better pack your greasy blankets and git!" And he did.—*Helena Independent.*

THE 30-ton water-jacket furnace at the Old Globe copper mine has been in constant blast for over two weeks, producing daily ten tons of copper. The mine seems to be fully able to furnish ore. We believe there is no furnace in Europe or America of similar size that is producing a like amount of copper bullion from crude ore. The company has been very fortunate in securing the services of so able a man as Mr. John Williams to superintend this truly wonderful property. The Buffalo and Hoosier will prove the pier of the Old Globe.—*Arizona Silver Belt.*

THE display of the Grand Central mine, Tombstone, A. T., prepared for the Denver exposition, is headed by a specimen of 150 lbs., which gives $2,286.29 in gold and $9,536.95 in silver.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. F. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

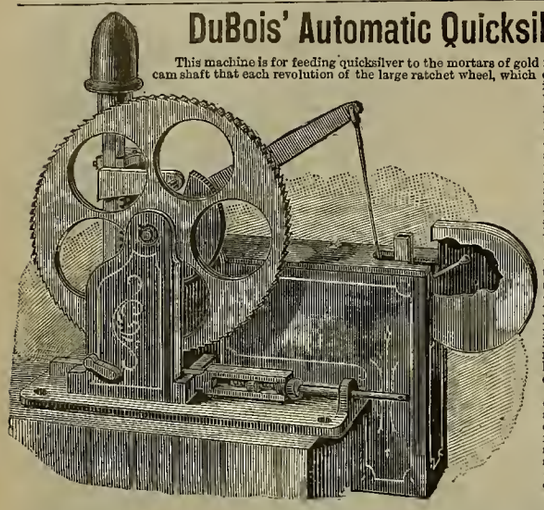
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.

Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents

22 & 24 Fremont St., San Francisco.

Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.

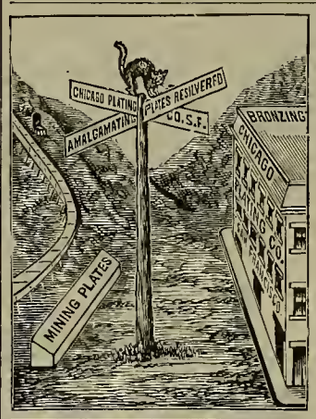
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.



Amalgamating Plates

REPLATED OR MADE TO ORDER BY THE

CHICAGO PLATING CO.

Pacific Power Building, 23 Stevenson St., S. F.,

And 261 & 263 Randolph St., Chicago.

Having opened a branch house in S. F., the largest Plating and Polishing Establishment on the Pacific Coast, with all the latest improvements in machinery for plating in Gold, Silver and Nickel, with 12 years' experience in the Eastern States and Europe, we claim that our Silver Plated Amalgamating Plates are the most economical, durable and successful Plates on the Pacific Coast for saving gold. Every description of metal goods plated in the most durable manner by the

Colorado Iron Works,

MANUFACTURERS OF

ENGINES, BOILERS, RAILWAY CAST AND WROUGHT WORK, BRIDGE WORK, BOLTS AND BOLT ENDS, BUILDING WORK, ETC.

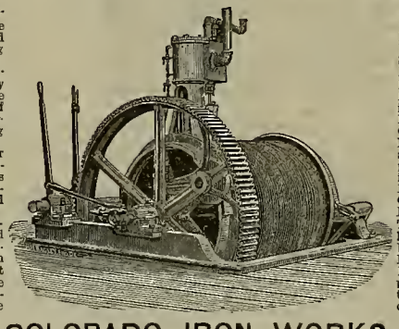
MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the



following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupella tion Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.

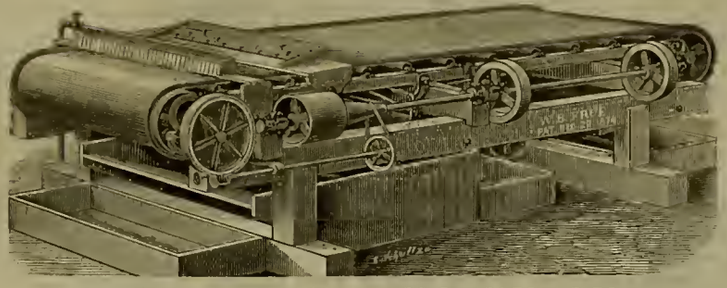
SHEET IRON PIPE.

FRANCIS SMITH & CO.,
Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand

SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.

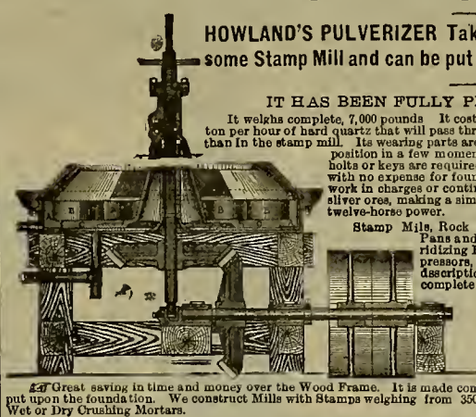
SHEET IRON PIPE.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.
Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.
☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Huckley, Spiers & Hayes, 220 Fremont street.
ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery



HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also

SPERRY'S
WROUGHT IRON FRAME
FOR STAMP MILLS.

☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

THE CONSUMERS' COMPANY.

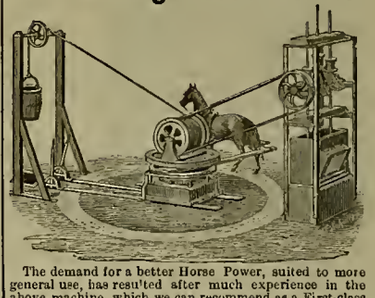
New Mining Horse Power.



The demand for a better Horse Power, suited to more general use, has resulted after much experience in the above machine, which we can recommend as a First-class Hoisting Power, under complete control of man tending bucket, through levers connecting with brake and clutch.
This power is light and strong, so that two or more horses can be used for crushing ore or other work.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR THE WEEK ENDING JULY 4, 1882.

260,445.—PROPULSION OF STREET CARS—R. F. Bridgewell, N. Y.

260,563.—SAW JOINTER—John A. Church, Nevada City, Cal.

260,571.—HAND LEVER FRUIT PRESS—A. J. Hunt, Albany, Oregon.

260,614.—SHIRT—David Lubin, Sacramento, Cal.

260,696.—THIMBLE—David Lubin, Sacramento, Cal.

260,123.—AX AND BRUSH HOOK—Levi T. Shelton, Oakland, W. T.

260,543.—CARRIAGE BRAKE—E. S. Davis, Kelseyville, Cal.

FOR THE WEEK ENDING JULY 11, 1882.

260,844.—NUT LOCK—Philip Curran, Caliente, Cal.

260,847.—LEATHER CREASER—Charles H. Corey, San Jose, Cal.

260,864.—SEWING MACHINE FOR MAKING BOTTLE COVERS—George Grisel, S. F.

260,980.—TWO-WHEEL VEHICLE—Henry Hortop, Butherford, Cal.

260,857.—VELOCIPEDE—William B. Morris, S. F.

260,859.—GRAIN-ADJUSTING BELT FOR HARVESTERS—S. T. Northcott, Marion Co., Oregon.

261,101.—SAFETY DEVICE FOR ELEVATORS—C. C. Palmer, Oakland, Cal.

261,085.—HEATER AND BASE FOR DRIERS—W. S. Plummer, San Jose, Cal.

261,086.—DRYING CHAMBER FOR FRUIT EVAPORATORS—W. S. Plummer, San Jose, Cal.

260,736.—EXPLOSIVE POWDER—William R Quinan, S. F.

261,044.—METAL DRILLING MACHINE—John Richards, S. F.

261,930.—SPRING BOTTOM OIL CAN—Z. St. Pierre, Bullionville, Nev.

260,913.—WATER WHEEL—Rufus W. Tufts, Santa Cruz, Cal.

261,079.—HORSE DETACHER—J. H. Clow, Sheridan, Or.

260,862.—HEADER—M. N. Laufenburg, S. F., Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

SEWING MACHINE FOR MAKING BOTTLE COVERS.—George Grisel. No. 260,863. Dated July 11, 1882.—This is a new and usefnl machine for making bottle covers, having reference more particularly to the mannfacture of covers made of the stems or stalks of reeds, grass, tule, and other similar fibrous materials, for which eaid covers made of the stems or stalks of tule, letters patent were issned to this inventor and E. K. Cooley in 1881. This invention consists in a pecnliar feeder, and in certain improvements whereby, through the means of a peculiar double-epring pawl, the tule stems are laid npon each other in a donble row at one end, to give the tapering ehape to the cover. It consists further in a pecnliar forming or sustaining bar, upon which the tnle is fed, and around which the cover is formed, a novel feature of said bar being a peculiar means by which it is raised and lowered, and supported at one end only, whereby the cover, when formed, may be readily removed. It consists further in a novel mechanism for forming the chain stitch which binds the stalks together, and certain other minor details of constrnction.

VEHICLE.—Henry Hortop, Rutherford, Napa Co., Cal. No. 260,980. Dated July 11, 1882. This invention relates to tbat class of two-wheeled vehicles known as "carts," and it consists in a novel arrangement of the shafts, springs and body, together with certain peculiar connections, whereby the object of the invention is accomplished—namely, to provide against the nnpleasant rocking motion which the jogging of the horse communicates to the seat, and renders the employment of a cart unadvisable. The arrangement may be briefly described as follows: The shafts are bent at each side of the lower portion of the body. They extend to and are firmly clipped to the axle. The springs are ordinary elliptical springs clipped to the axle and having crossbars clipped to their tops. Upon these bars the body is secnred, either firmly or hinged, its foot-rest or lower portion extending down and forward between the shafts. Tnis lower portion is not attached to the shafts, bnt is snpported npon each side by covered braces secnred to each side of the body, or to a bar therennder, and having its npper ends bolted to the crossbar npon which the body is secured. The forward ends of the springs are connected with the shafts by links pivoted to each.

NUT LOCK.—Phillip Curran, Caliente, Kern county, Cal. No. 260,848. Dated July 11, 1882. Tnis is a new and nsefnl nut lock, and it consists in the employment of a locking device formed as an inverted W, one end or leg of which is larger than the other, said device heing partially fitted under the nut when in a certain position, and hy the movement of the nut adapted to advance to its limit hy reason of the corner of the nut fitting within the space formed hy its center pieces. The object of the invention is to provide generally against the loosening of the nuts after they are screwed up tightly in place and to prevent them from coming off; bnt its particnlar application is to nuts securing the fish plates to rails.

LEATHER CREASER.—Charles H. Corey, San Jose. No. 260,847. Dated July 11, 1882. In the ordinary construction of machines for creasing and ornamenting tags and straps for harness and other leatherwork, two flanged rollers are employed having the creasing ridges formed upon their peripheries. These rollers are geared to run together so that the ridges will exactly correspond upon each side and the flanges npon their sides guide the leather as it passes through. In its progress between these rollers, however, the leather becomes stretched or elongated, so that the ridges would not follow the same marks if the leather were again put through the rollers. Consequently the creasing must be completed at one operation, and if it is imperfect in any part, it can only be remedied by hand. The machine under consideration is designed to hold the leather so that a single creasing roller without flanges may be passed over it any number of times and the ridges npon the rollers follow the indentations exactly. The creasing roller has suitably shaped creasing ridges formed on its surface. The shaft of the roller runs in a frame, which moves above a table or bench having an adjustable channel in which the leather to be operated on lies, and by which it is prevented from stretching, so that the creaser may be passed over it a nnmber of times and follow the original marks.

HEADER.—M. N. Lanfenberg, assignor to Baker & Hamilton, S. F. No. 260,862. Dated July 11, 1882. Tnis invention is to be headers consists in a means for balancing the machine so that the weight of the elevator spout will assist in raising and depressing the lever by which the sickle is adjusted to the proper hight. In the ordinary header the hearing wheels support a frame, the front of which carries the sickle bar and carrying belt for the cut grain, while the elevator spont is hinged at one end of the front portion. The pole to which the team is harnessed is hinged to the rear of the frame, and a lever secured to the front of the frame extends back above the pole so as to be within easy reach of the driver, in the usual manner of constructing these machines. When at work, however, the strain is so great that it is almost impossible to move the lever when it is desired to raise the sickle, on account of the weight of the forward part of the machine and the overhanging spout. Tnis invention is intended to equalize this weight by so connecting the rope which suspends the spont with the frame and tongue that the weight of the spont counterbalances the pressnre npon the lever.

WATER WHEEL.—Rufus W. Tufts, Santa Cruz. No. 260,913. Dated July 11, 1882. This improvement in water wheels applies particularly to those in which a body of water under pressure is confined, and in seeking to escape, is caused to pass through suitable channels npon wheels adapted to revolve, whereby said wheels are moved with power and rapidity. The invention consists in the construction and arrangement of a wheel or wheels having curved flanges set at an angle, rigidly secnred npon a central shaft, with a peculiar directing chute or chutes, the channels of which are in relation with the flanges npon the wheels, and which direct the pressure of water thereon to the best advantage.

VELOCIPEDE.—Wm. B. Morris, S. F. No. 260,857. Dated July 11, 1882. This improvement in velocipedes consists in a novel means of propelling and guiding them. It would require diagrams to describe the details of constrnction of this machine properly.

News in Brief.

FRANCE will join with England in protecting the Suez canal.

THE widow of Abraham Lincoln died at Springfield, Ill., after a long illness.

THE pension appropriation bill (appropriating $100,000,000) was passed by the Senate Saturday.

THE majority for the prohibition amendment in Iowa was 29,751; total nnmber of votes cast, 281,381.

A DISTRICT governor was beheaded, and 25 soldiers of his escort killed by Montenegrin insurgents.

THE Mayor and City Council of Leadville, Col., have been arrested, fined and imprisoned for contempt of court.

THE transfer of Gen. Crook to the Department of Arizona gives great satisfaction to the people of that Territory.

THE corner-stone of the new Catholic seminary at Mission San Jose, for the education of priests, was laid Sunday.

JOHN RINGGOLD, "king of the cowboys," killed himself at Morse's canyon, in the Caihnahua mountains, Arizona, Friday.

THE British rifle team, to take part in the International shooting match at Creedmoor, will leave England for New York August 26th.

THE Secretary of the Treasury estimates that the pending hill will rednce the revenne from sugar and steel nearly $10,000,000 per annum.

THE Marin county court-room presented the singular spectacle the other day of a woman arraigned for murder, who had a six months' old infant in her arms.

FISH COMMISSIONER PARKER has been very snccessful in planting fish in Washoe Lake. He has introduced into that body of water the Sacramento river perch and catfish.

"Clear Lake and Calistoga"

The Clear Lake and Calistoga Stage route has become a very popular one for health and pleasure seekers going to the many springs and other resorts in Lake county, and lately the stages to Lakeport have been well filled. Anderson, Harbin, Adams, Howard, Siegler, Gordon, Bartlett, Highland and Pierson springs, Soda Bay, Blue Lakes, Middletown, Lower Lake, Sulphur Banks, Kelseyville, Lakeport, Great Western and Oat Hill and other quicksilver mines are all reached by the popular stage line under the veteran management of W. F. Fisher, whose headquarters are at his Lodi stables, Calistoga. The route from San Francisco to Calistoga is a delightful one, taking the Central Pacific Railroad ferry to Oakland, along the eastern shore of the bay, passing Berkeley, San Pablo, to the Vallejo landing; across the Straits of Carquinez, with fine marine and distant mountain views; passing Vallejo, with Mare Island and its Government works in view; up the valley to Napa; thence pass the thrifty towns of Napa valley and through its rich fields of grain, vines and orchards, bordered on the east side by hills clothed in rich verdure, with a top fringe of evergreen trees, picturesque in the extreme as they face the traveler in bold relief in front of their skyward home. The stage from Calistoga passes a mile or two across the valley and immediately begins the ascent of Mt. St. Helena, and for five miles up to the summit of the ridge, and down the mountain pass a like distance, the scenery is grand and picturesque in qualities rarely equalled or excelled elsewhere. Still farther and higher over Cobb mountain to Clear Lake and Lakeport—and, in fact, throughout most parts of Lake county—the roads abound with grand scenery and delightful views of charming brooks, lakes or meadows.

For Sale.

A twenty-stamp steam mill, complete and almost new. Also, air compressors, drills and mining machinery. Anyone having a gold or silver mine warranting the investment, may buy this material on time by making monthly or quarterly payments. Address, CHARLES E. SHERMAN, Havilah, Kern County, Cal.

Back Numbers Wanted.

We will pay 10 cents a copy for the following numbers of the MINING AND SCIENTIFIC PRESS: Volume, 13; year, 1866; number, 1. Volume, 15; year, 1868; number, 3. Volume, 20; year, 1870; numbers, 1 and 26. Volume, 23; year, 1871; number, 1. Volume, 30; year, 1875; numbers, 2, 3, 4, 7, 10, 11, 12, 13 and 15.

DIVIDEND NOTICE.

OFFICE OF THE

Eureka Consolidated Mining Company.

Nevada Block, Room 27, S. F., July 15, 1882.

At a meeting of the Board of Directors of the above named Company, held at their office this day, a dividend (No. 75) of Twenty-five (25c) cents per share, was declared payable on the TWENTY-SEVENTH day of July, 1882. Transfer books close with the 22th inst.

P. JACOBUS, Sec'y pro tem.

DIVIDEND NOTICE.

The German Savings and Loan Society.

San Francisco, June 20, 1882.

For the half year ending this date, the Board of Directors of THE GERMAN SAVINGS AND LOAN SOCIETY has declared a dividend on Term Deposits at the rate of four and thirty-two one-hundredths (4 32-100) per cent. per annum, and on Ordinary Deposits at the rate of three and six-tenths (3 6-10) per cent. per annum, free from Federal Taxes, and payable on and after the 10th day of July, 1882. By order. GEO. LEITE, Secty.

RESCINDMENT NOTICE.

OFFICE OF THE NORWICH G. & S. MINING CO., No. 310 Pine street, room 18, San Francisco, California, July 10, 1882. At a meeting of the Board of Directors, held this day, Assessment No. 1, of 20 cents, levied on the 5th day of June, 1882, was rescinded. A. L. PERKINS, Secty.

EXCURSION

TO ALASKA.

The August trip of the Steamship IDAHO to Alaska will be made a special feature of interest for tourists and pleasure seekers. In addition to her regular ports of call (Wrangel, Sitka, Harrisburg, etc.) it is intended she shall visit Glacier Bay and other points of special interest.

The trip from Puget Sound to Alaska, instead of being, as many imagine, rough and tempestuous, is made nearly the whole distance on inland waters, which are as smooth and unruffled as a mountain lake. The scenery is a magnificent panorama of wondrous grandeur. The most and celebrated points of interest in California and other States dwarf into insignificance in comparison with the wonderful sights and towering mountains in this wonderland of glaciers, icebergs, Aurora Borealis and nightless day. Only a limited number of passengers can be taken from San Francisco, as a large number of tourists have engaged to go from Portland, Victoria and other northern ports.

Those desiring to engage passage will please register their names at the Company's Ticket Office, 214 Montgomery street. No name accepted unless accompanied by a deposit of $20 on account.

The fare for the round trip has been fixed at a low rate of $115, which includes meals and a berth.

Passengers will take the DAKOTA, which leaves Broadway Wharf July 25th, at 2 P. M., and transfer to the IDAHO at Port Townsend about August 31, reaching San Francisco on the return about August 25th.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR THE WEEK ENDING JULY 4 1882.

260,648.—PROPULSION OF STREET CARS—R. F. Bridewell, S. F.

260,663.—SAW JOINTER—John A. Church, Nevada City, Cal.

260,571.—HAND LEVER FRUIT PRESS—A. J. Hunt, Albany, Oregon.

260,694.—SHIRT—David Lubin, Sacramento, Cal.

260,695.—THIMBLE—David Lubin, Sacramento, Cal.

260,423.—AX AND BRUSH HOOK—Levi T. Shelton, Oakland, W. T.

260,543.—CARRIAGE BRAKE—E. S. Davis, Kelseyville, Cal.

FOR THE WEEK ENDING JULY 11, 1882.

260,848.—NUT LOCK—Phillip Curran, Caliente, Cal.

260,847.—LEATHER CREASER—Charles H. Corey, San Jose, Cal.

260,863.—SEWING MACHINE FOR MAKING BOTTLE COVERS—George Grisel, S. F.

260,980.—TWO-WHEEL VEHICLE—Henry Hortop, Rutherford, Cal.

260,887.—VELOCIPEDE—William B. Morris, S. F.

260,889.—GRAIN-ADJUSTING BELT FOR HARVESTERS—S. T. Northcott, Marion Co., Oregon.

261,101.—SAFETY DEVICE FOR ELEVATORS—C. C. Palmer, Oakland, Cal.

261,035.—HEATER AND BASE FOR DRIERS—W. S. Plummer, San Jose, Cal.

261,036.—DRYING CHAMBER FOR FRUIT EVAPORATORS—W. S. Plummer, San Jose, Cal.

260,786.—EXPLOSIVE POWDER—William R Quinan, S. F.

261,044.—METAL DRILLING MACHINE—John Richards, S. F.

261,030.—SPRING BOTTOM OIL CAN—Z. St. Pierre, Bullionville, Nev.

260,913.—WATER WHEEL—Rufus W. Tufts, Santa Cruz, Cal.

261,079.—HORSE DETACHER—J. H. Clow, Sheridan, Or.

260 882.—HEADER—M. N. Laufenburg, S. F., Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

SEWING MACHINE FOR MAKING BOTTLE COVERS.—George Grisel. No. 260,863. Dated July 11, 1882.—This is a new and useful machine for making bottle covers, having reference more particularly to the manufacture of covers made of the stems or stalks of reeds, grass, tule, and other similar fibrous materials, for which said covers made of the stems or stalks of tule, letters patent were issued to this inventor and E. K. Cooley in 1881. This invention consists in a peculiar feeder, and in certain improvements whereby, through the means of a peculiar double-spring pawl, the tule stems are laid upon each other in a double row at one end, to give the tapering shape to the cover. It consists further in a peculiar forming or sustaining bar, upon which the tule is fed, and around which the cover is formed, a novel feature of said bar being a peculiar means by which it is raised and lowered, and supported at one end only, whereby the cover, when formed, may be readily removed. It consists further in a novel mechanism for forming the chain stitch which binds the stalks together, and certain other minor details of construction.

VEHICLE.—Henry Hortop, Rutherford, Napa Co., Cal. No. 260,980. Dated July 11, 1882. This invention relates to that class of two-wheeled vehicles known as "carts," and it consists in a novel arrangement of the shafts, springs and body, together with certain peculiar connections, whereby the object of the invention is accomplished—namely, to provide against the unpleasant rocking motion which the jogging of the horse communicates to the seat, and renders the employment of a cart unadvisable. The arrangement may be briefly described as follows: The shafts are bent at each side of the lower portion of the body. They extend to and are firmly clipped to the axle. The springs are ordinary elliptical springs clipped to the axle and having cross-bars clipped to their tops. Upon these bars the body is secured, either firmly or hinged, its foot-rest or lower portion extending down and forward between the shafts. This lower portion is not attached to the shafts, but is supported upon each side by covered braces secured to each side of the body, or to a bar thereunder, and having its upper ends bolted to the cross-bar upon which the body is secured. The forward ends of the springs are connected with the shafts by links pivoted to each.

NUT LOCK.—Phillip Curran, Caliente, Kern county, Cal. No. 260,848. Dated July 11, 1882. This is a new and useful nut lock, and it consists in the employment of a locking device formed as an inverted W, one end or leg of which is larger than the other, said device being partially fitted under the nut when in a certain position, and by the movement of the nut adapted to advance to its limit by reason of the corner of the nut fitting within the space formed by its center pieces. The object of the invention is to provide generally against the loosening of the nuts after they are screwed up tightly in place and to prevent them from coming off; but its particular application is to nuts securing the fish plates to rails.

LEATHER CREASER.—Charles H. Corey, San Jose. No. 260,847. Dated July 11, 1882. In the ordinary construction of machines for creasing and ornamenting tugs and straps for harness and other leatherwork, two flanged rollers are employed having the creasing ridges formed upon their peripheries. These rollers are geared to run together so that the ridges will exactly correspond upon each side and the flanges upon their sides guide the leather as it passes through. In its progress between these rollers, however, the leather becomes stretched or elongated, so that the ridges would not follow the same marks if the leather were again put through the rollers. Consequently the creasing must be completed at one operation, and if it is imperfect in any part, it can only be remedied by hand. The machine under consideration is designed to hold the leather so that a single creasing roller without flanges may be passed over it any number of times and the ridges upon the rollers follow the indentations exactly. The creasing roller has suitably shaped creasing ridges formed on its surface. The shaft of the roller runs in a frame, which moves above a table or bench having an adjustable channel in which the leather to be operated on lies, and by which it is prevented from stretching, so that the creaser may be passed over it a number of times and follow the original marks.

HEADER.—M. N. Laufenberg, assignor to Baker & Hamilton, S. F. No. 260,882. Dated July 11, 1882. This invention in headers consists in a means for balancing the machine so that the weight of the elevator spout will assist in raising and depressing the lever by which the sickle is adjusted to the proper hight. In the ordinary header the bearing wheels support a frame, the front of which carries the sickle bar and carrying belt for the cut grain, while the elevator spout is hinged at one end of the front portion. The pole to which the team is harnessed is hinged to the rear of the frame, and a lever secured to the front of the frame extends back above the pole so as to be within easy reach of the driver, in the usual manner of constructing these machines. When at work, however, the strain is so great that it is almost impossible to move the lever when it is desired to raise the sickle, on account of the weight of the forward part of the machine and the overhanging spout. This invention is intended to equalize this weight by so connecting the rope which suspends the spout with the frame and tongue that the weight of the spout counterbalances the pressure upon the lever.

WATER WHEEL.—Rufus W. Tufts, Santa Cruz. No. 260,913. Dated July 11, 1882. This improvement in water wheels applies particularly to those in which a body of water under pressure is confined, and in seeking to escape, is caused to pass through suitable channels upon wheels adapted to revolve, whereby said wheels are moved with power and rapidity. The invention consists in the construction and arrangement of a wheel or wheels having curved flanges set at an angle, rigidly secured upon a central shaft, with a peculiar directing chute or chutes, the channels of which are in relation with the flanges upon the wheels, and which direct the pressure of water thereon to the best advantage.

VELOCIPEDE.—Wm. B. Morris, S. F. No. 260,887. Dated July 11, 1882. This improvement in velocipedes consists in a novel means of propelling and guiding them. It would require diagrams to describe the details of construction of this machine properly.

News in Brief.

FRANCE will join with England in protecting the Suez canal.

THE widow of Abraham Lincoln died at Springfield, Ill., after a long illness.

THE pension appropriation bill (appropriating $100,000,000) was passed by the Senate Saturday.

THE majority for the prohibition amendment in Iowa was 29,751; total number of votes cast, 281,381.

A DISTRICT governor was beheaded, and 25 soldiers of his escort killed by Montenegrin insurgents.

THE Mayor and City Council of Leadville, Col., have been arrested, fined and imprisoned for contempt of court.

THE transfer of Gen. Crook to the Department of Arizona gives great satisfaction to the people of that Territory.

THE corner-stone of the new Catholic seminary at Mission San Jose, for the education of priests, was laid Sunday.

JOHN RINGGOLD, "king of the cowboys," killed himself at Morse's canyon, in the Chihuahua mountains, Arizona, Friday.

THE British rifle team, to take part in the International shooting match at Creedmoor, will leave England for New York August 26th.

THE Secretary of the Treasury estimates that the pending bill will reduce the revenue from sugar and steel nearly $10,000,000 per annum.

THE Marin county court-room presented the singular spectacle the other day of a woman arraigned for murder, who had a six-months' old infant in her arms.

FISH COMMISSIONER PARKER has been very successful in planting fish in Washoe Lake. He has introduced into that body of water the Sacramento river perch and catfish.

"Clear Lake and Calistoga."

The Clear Lake and Calistoga Stage route has become a very popular one for health and pleasure seekers going to the many springs and other resorts in Lake county, and lately the stages to Lakeport have been well filled. Anderson, Harbin, Adams, Howard, Siegler, Gordon, Bartlett, Highland and Pierson springs, Soda Bay, Blue Lakes, Middletown, Lower Lake, Sulphur Banks, Kelseyville, Lakeport, Great Western and Oat Hill and other quicksilver mines are all reached by the popular stage line under the veteran management of W. F. Fisher, whose headquarters are at his Lodi stables, Calistoga. The route from San Francisco to Calistoga is a delightful one, taking the Central Pacific Railroad ferry to Oakland, along the eastern shore of the bay, passing Berkeley, San Pablo, to the Vallejo landing; across the Straits of Carquinez, with fine marine and distant mountain views; passing Vallejo, with Mare Island and its Government works in view; up the valley to Napa; thence pass the thrifty towns of Napa valley and through its rich fields of grain, vines and orchards, bordered on the east side by hills clothed in rich verdure, with a top fringe of evergreen trees, picturesque in the extreme as they face the traveler in bold relief in front of their skyward home. The stage from Calistoga passes a mile or two across the valley and immediately begins the ascent of Mt. St. Helena, and for five miles up to the summit of the ridge, and down the mountain pass a like distance, the scenery is grand and picturesque in qualities rarely equalled or excelled elsewhere. Still farther and higher over Cobb mountain to Clear Lake and Lakeport—and, in fact, throughout most parts of Lake county—the roads abound with grand scenery and delightful views of charming brooks, lakes or meadows.

For Sale.

A twenty-stamp steam mill, complete and almost new. Also, air compressors, drills and mining machinery. Anyone having a gold or silver mine warranting the investment, may buy this material on time by making monthly or quarterly payments. Address, CHARLES E. SHERMAN, Havilah, Kern County, Cal.

Back Numbers Wanted.

We will pay 10 cents a copy for the following numbers of the MINING AND SCIENTIFIC PRESS: Volume, 13; year, 1866; number, 1. Volume, 18; year, 1868; number, 5. Volume, 20; year, 1870; numbers, 1 and 26. Volume, 22; year, 1871; number, 1. Volume, 30; year, 1875; numbers, 2, 3, 4, 7, 10, 11, 12, 13 and 15.

OFFICE OF THE

Eureka Consolidated Mining Company.

Nevada Block, Room 37, S. F., July 15, 1882.

At a meeting of the Board of Directors of the above-named Company, held at their office this day, a dividend (No. 75) of Twenty-five (25c) cents per share, was declared payable on the TWENTY-SEVENTH day of July, 1882. Transfer books close with the 28th inst.

P. JACOBUS, Sec'y pro tem.

DIVIDEND NOTICE.

The German Savings and Loan Society.

San Francisco, June 30, 1882.

For the half year ending this date, the Board of Directors of THE GERMAN SAVINGS AND LOAN SOCIETY has declared a dividend on Term Deposits at the rate of four and thirty-two one-hundredths (4 32-100) per cent. per annum, and on Ordinary Deposits at the rate of three and six-tenths (3 6-10) per cent. per annum, free from Federal Taxes, and payable on and after the 10th day of July, 1882. By order. OEO. LETTE, Sec'y.

RESCINDMENT NOTICE.

OFFICE OF THE NORWICH G. & S. MINING CO., No. 310 Pine street, room 15, San Francisco, California, July 10, 1882. At a meeting of the Board of Directors, held this day, Assessment, No. 1, of 20 cents, levied on the 5th day of June, 1882, was rescinded. A. L. PERKINS, Sec'y.

EXCURSION

TO ALASKA.

The August trip of the Steamship IDAHO to Alaska will be made a special feature of interest for tourists and pleasure seekers. In addition to her regular ports of call (Wrangel, Sitka, Harrisburg, etc.) it is intended she shall visit Glacier Bay and other points of special interest.

The trip from Puget Sound to Alaska, instead of being, as many imagine, rough and tempestuous, is made nearly the whole distance on inland waters, which are as smooth and unruffled as a mountain lake. The scenery is a magnificent panorama of wondrous grandeur. The noted and celebrated points of interest in California and other States dwarf into insignificance in comparison with the wonderful sights and towering mountains in this wonderland of glaciers, icebergs, Aurora Borealis and nightless day. Only a limited number of passengers can be taken from San Francisco, as a large number of tourists have engaged to go from Portland, Victoria and other northern ports.

Those desiring to engage passage will please register their names at the Company's Ticket Office, 214 Montgomery street. No name accepted unless accompanied by a deposit of $20 on account.

The fare for the round trip has been fixed at a low rate of $115, which includes meals and a berth.

Passengers will take the DAKOTA, which leaves Broadway Wharf July 29th, at 2 P. M., and transfer to the IDAHO at Port Townsend about August 3d, reaching San Francisco on the return about August 25th.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

PACIFIC MACHINERY DEPOT.

The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

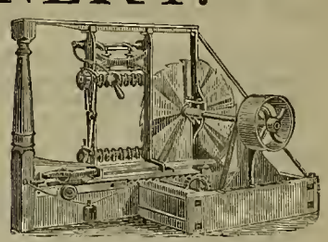
PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in very short time. One machine will concentrate the tailings from a five-stamp battery.

☞ Send for Circulars. ☜



SHINGLE MACHINE.

For simplicity, durability and rapidity of action, these Machines have no equal, cutting from 3,000 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

WATER JACKET SMELTING FURNACES

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plante made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.

Send for circular.

ORE CONCENTRATORS—TWO OF DODGE'S PATent, new, at half price. Inquire at 73 Nevada Block, S. F.

"THE $1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.

Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking-table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane, or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.

The Challenge Ore Feeders are now in Use in the following Mills, besides many others

Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King" Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill, of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Hendy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

JOSHUA HENDY, Agent,

Machine Works 49 and 51 Fremont Street, San Francisco.

Manufacturer of Quartz, Saw Mill and General Machinery. Also Agent for BAKER ROTARY PRESSURE BLOWERS, and WILBRAHAM ROTARY PISTON PUMPS. P. BLAISDELL & CO.'S Machinists' Tools. HOT POLISHED SHAFTING from the Akron Iron Company, of Akron, Ohio.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are teeted for Safety against Friction, Fire, a Temperature of 212° Fahr., and the varioue ehocke to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shioped to them will he GIVEN IN FOOT POUNDS. ☞Send for Pamphlet showing methods of testing the different qualities of all Powders.

The Company manufactures

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT. No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." t is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can he used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Ratee.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, JULY 29, 1882. VOLUME XLV Number 5

Mine Ventilation.

We havo recently given considerahls attention to this important snhjeot, and now givs some extraots from another article hy Mr. C. M. I'eroy, whoss papers are heing puhlished in series in the *Colliery Guardian:*

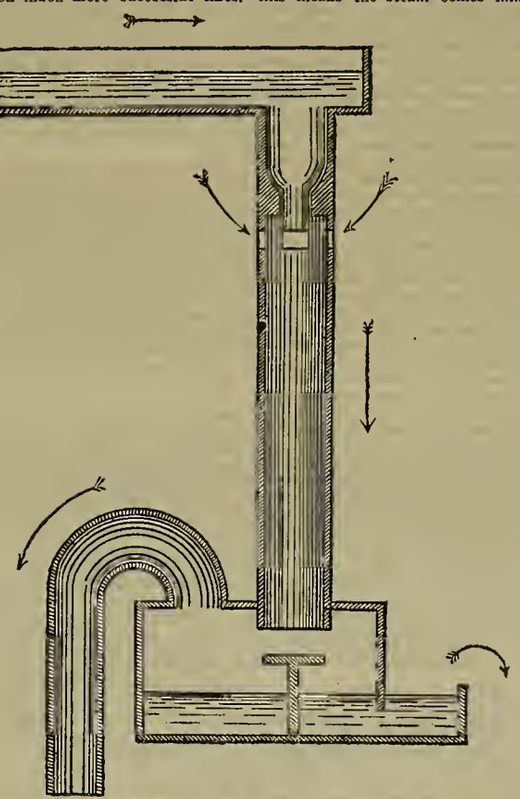
It is proposed in this article to say something as to the principle and construction of the ventilating machines that have been at all extensivsly nsed, and for convenience ws may divide them into three olassos: First, thoss which act like pnmps, and ars provided with pistons and valvos, as in the Strnvs and the Nixon; seoond, those which sweep out a definite volnms of air eaoh revolution, snch as Lemielle, Fahry, Cooke and Root; third, fans acting on the cntrifogal principle, as illnstrated in Nasmyth, Biram, Brunton, Rammell, Waddle, Schiele and Guihal.

It might just he remarked, as showing how history seems to repeat itself in matters of this kind, as of evsrything else, and that virtually "there is nothing new nnder the sun"—that dnring a discussiou at Birmingham in 1856, it was stated that there was nothing new in the principle of ventilation hy purely meohanical means, the same prinoiple having heen in use centuries ago on the ontinent, although of comparatively recent introduction into this country. The old Germsn miners had nsed an inverted tnh placed in water, and worked up and down hy a lever, with an air valve at the top opening inwards, the fresh air heing alternately drawn into the tub and expelled along an air main condncting it into the working. Prohahly the lack of success attending early efforts in connection with mechanical ventilation was hecanse there was nothing like the same necessity as in our time. Miuing operations heing not only much more limited in their scope, hut, in proportion to their extent, the danger materially less.

But there are other methods of effecting ventilation, either without mechanism or else such as are not includsd in the three classes named; and these we will deal with first, and it will he well to refer to efforts made in snch directions, as ntilizing the power of falling water, or the heat and momentum of steam for producing a ourrent without the intervention of machines.

An air current has been produced hy the employment of a waterfall, and this arrangemsnt is not unlike that extensively used in the early mannfacture of iron, hy what was known as the Catalan process, and might he termed a waterhlast apparatus. The action was hased npon the fact that falling water drags the surrounding and entsngled air along with it, prodncing an exhausting effeot when the air can only enter by oertain properly arranged orifices. The apparatus consisted of a vertioal pipe slightly contracted just helow its npper end, at which the water is admitted, and provided with small openinge or aspiratore immediately helow the oontraction, through which the air is drawn in and carried away hy the currsnt of water. The arrangement produced a low, nseful effeot. We may, however, assume that falling water will produce a current in the same direction that it falls; and, althongh snch falling water may not have a high useful effect, we ehonld learn a useful lesson, and be oarefol not to have pnmps or to wind water, if it can he avoided, in upcast shafts, hecanse water, more or less, will he falling down the ehaft and opposing the current; whereas, placed in the downcast, should water finds ite way down the pit from the teeming trough or the pump etocks, the tendency will he to help the current. Before passing away from this part of the subject, it may be said that at one time the application of water power to produce a ventilating current was popular in some mining districts. Where a head of water can he ohtained on a hillside, and there is a level, or adit, to conduct the water away after having porformed its duty in falling from a sufficient hight, it may produce a low usefnl effect, hut it costs nothing, therefore is economical. The engraving gives a sufficisntly olear idsa how the air and water pass together down the vertical pipe, and falling upon a kind of dashboard at the hottom, separate. The water falls and passee away to the right, whilst the air, liherated hy the shook, rises, and making its way to the left, passes round the curvsd pipes and produces a current.

An appliance was tried a considerahle time ago, whioh involvsd the action of a screw revolving in water, and was called the Archimedean or Dutoh screw, placed horizontally in a oylinder and filled with watsr to such a hight that the lower edge of the shaft whioh carriss the sorew is always immersed to a certain extent. By this contrivance, ths compartments which ars formed ahove ths water hy the spires of the helicoidal surface, and ths npper half of the cylinder, are isolated from each othsr, and a rotsry movement transmitted to the screw prodnoos a motion of translation along the axis of the mass of air whioh fills these compartments. The air is drawn in at one end of the sorew and forced ont at the other. This arrangement was called the hydro-pneumatic sorew, and was snggested hy M. Gnihal, who afterwards worksd on muoh more succssfnl lines.



AIR CURRENT FROM FALLING WATER.

It affords another example of efforts tending toward a certain result heing first directed in scarcely the right groove, hnt leading up to a successful issue. The arrangement wae not successfnl, chiefly hecause the friction of the screw was so enormoue in proportion to the work done. This was certain to he, hecause a screw, whether constructed for moving air or for moving coals, as sometimes used at collieries, generates too mnch friction to prodnce high useful effeot.

The direct employment of steam without the intervention of machinery has heen tried to produce ventilation, and certainly was a more feasihle arrangement than falling water or Archimedean screws. Because steam will have somewhat the same influence as a furnace; it will heat the air, and in so doing rarefy it, causing a partial vacuum. The advantage of such a eystem is that the furnace under-ground is not needed, and the steam can he conveyed simply in a pipe from the range of surface hoilers. In the matter of simplicity it ie all right, hut nnless the heat applied to steam is to he used for actnal pressure it is expsnsive heat. And in this case we lose, so far as ventilation is concerned, such heat as passes up the hoiler chimney, hut which in furnace ventilation passee up the pit shaft and heats the air. And however muoh economy we may effsct hy nsing steam in a well-oonstrnoted steam engine with high expansion and good condenser, we can hardly expeot to get good results from simply tnrning steam into a shaft to heat the air, and if the steam condenses, as it is liahle to do, the products of condensation heing water, would in falling tend to reverse the current.

In effecting vsntilation hy steam jet, sometimes a pipe is simply carried some distance down the shaft and allowed to deliver its contents without any special oontrivance at the end. At other times the arrangement is more elahorate and comprises a down pipe supplying a circle pipe fitted to something like the sweep of the shaft. This oircle pipe is perforated with small holes on the higher side, and allows the steam to issne in a number of small jets. By this means the steam comes immediately in contact with a very much larger air surface and is proportionately more effective. If the shaft is a very dry one, some good will he done, hut if the shaft is wet, immediately the steam comee in contact with the wet sidee condensation will ensne, and instead of the steam assisting the air to ascend, the water resulting from oondensation will fall and impede the current. The principle of using the steam jet as a means of ventilation is that it acte npon the air surrounding it and administers to its momentum. Taken in this way, eteam under certain circumstances and favorahle conditions may give fair results and has shown good work in several ways. The draught of the locomotive, without which the locomotive would be a very imperfect maohine, is ohtained hy the action of a jet of eteam administering momentum to the air in the smoke hox, and hy so doing producing a dranght through the tuhes.

Two old miners claim to have discovered gold in the Clackamas county, Or., Cascade range, seven miles east of Highland. They are hard at work sinking on the ledge. It is the helief of many that the Cascade range np there is rich in precious mstals, hut they are at uusual depths.

Every county in Arizona will he represented at the Denver mining sxposition.

The Denver Mining Exposition.

The Denver exposition opens on Tnesday evening, August 1st. The Commissioner from this State, Mr. W. B. Ewer, expeots to ho present at the opening. The oitizens are now making earnest efforts to secure sufficient fnnds to defray the expenses of collecting and forwarding an exhibit of minerals and ores. It has been ascertsined that a very fine colleotion can readily he made as soon as the necessary funds are provided.

As to mining machinery, for which California is famous throughout ths mining regions on ths coast, it will he impossihle for us to send any from here. The rsason for this is that the main part of the machinery is made to order, and is needed immediately on its completion. The city foundries, whils they are all engaged in mining machinery of various kinds, at present have none on hand which could he forwarded for the purposes of exhihition. This is greatly to he regretted, since the mschinery made in this city has a reputation second to none, and our foundry men would, no douht, carry off the honors in this connection. Of ores and minerals, Californis, as the oldest mining State, has many collections; that of the University of California comprising several, now consolidated into one. In this collection is the very extensive one made hy the State Geological Survey, which took msny years and great lahor to perform. The Stste collection in the State Mining Bureau, in this city, could not, of course, he sent away from the State Museum without special permission from the Legislature; and that, not heing in session, it is, of course, impracticahle to think of moving it.

However, as we have stated, provided the necessary funds are forthcoming, there will he no difficulty in getting together quite an extensive and varied collection which will represent all the various mining interests of ohis State. It is to he hoped, therefore, that if California is to he represented at all, it will he in a manner proportionate to onr mining area and importance. The movement towards the sxposition has commenced so late that whatever arrangements are to be made must he perfected immediately. A fsw days now will determine the question.

The Difference.—Ths Denver *Tribune* says: When a great mine has passed its usefulness as a stock johhing scheme it is given over to the class known as "leasers." These men soon enrich themselves hy working gronnd in which the great corporation oonld find no paying ore. The professional leaser ie always eager to get possession of "exhansted" mines. He ie the gleaner of the fields after the harvestere have removed the crop, and it is an easy matter for him to clean up a reasonahle fortnne from ahandoned drifts and stopes. The Robinson is now in the hands of men who will he certain to make it pay. We are told that they are extracting large quantities of good ore from the dnmp and upper levels; that during the past three weeks over 30 carloads of mineral havs heen chipped to the smelters, which gave an average of 60 ounces to the ton. A considerahle proportion was taken from the dnmps, whioh are expected to yield large returns from careful assorting. Several Cornish miners have accumulated means enough from ahandoned mines in Gilpin connty to enahle them to return to England and live luxnriously there. These facte are illustrative of the difference hetween individual and corporate mining.

Lumbering Business.—The Nevada City *Transcript* says: Most all of the saw mills in the npper part of the county are, we are told, running on half time, or with only a half force of hands. It ie said that it is difficult to get men for saw-mill work who will he faithful and stick to their work. Wood choppers are also said to he very scarce, and, although the price for chopping wood has considerahly advanced, it ie hard work to get men for that sort of a joh. It appears that there are hut very few idle men in this part of the country.

Forest Trees of California.*

California Myrtle, or Sweet-gale Tree.
(Myrica Californica.)

"Sitting in a pleasant shade,
Which a grove of myrtles made."—*Bannerfield.*

A tree 30 to 40 ft. high, 1 to 3 ft. in diameter; always a large shrub of 10 to 20 ft., emulating trees. These dark evergreen, densely leafy shrubs or trees are covered with balsamic glands that yield their sweet aroma to the breeze, and when bruised in the hand emit a strong but refreshing, resinous, or rather balsamic odor, as observed, that greatly reminds you of the Eastern little sweet-fern shrub (*Comptonia asplenifolia*), to which it is allied. To the European, however, it recalls the delightfully fragrant sweet gale (*Myrica Gale*), of his home beyond the waves; and, by the way, it should be noted that the true sweet gale is also a native of California, found in the canyons in the vicinity of Yosemite, where we colleoted it many years ago. These myrtle leaves are rather narrow, one-half inch or less, lance-shapsd, about three inches long, somewhat saw-toothed on the margins, chiefly above, moderately wedged toward the base, alternate, and when young, of a bright, lively, yellowish-green tint, slightly varnished, the color nsarly alike on both surfaces. This cheerful hue is very pleasing to the eye, seen against the darker background of the old and denser foliage itself. In all the earlisr periods of growth, even well nigh unto old age, the habit is mainly more strict and erect than much spreading; hark, dark, iron-hued, not very rough, often smoothish; aments, or tags, very short and crowded, not conspicuous; the granular-surfaced herries of the size of peas, clusters situated along the twigs near the end of the previous year's growth. They are dark purple, staining the fingers on pressure. The very thin pellicle of wax is so obscure, one is apt to overlook it altogether unless spscial attention is called to solve the question.

The largest myrtle ever seen here, so far as I am aware, flourished in the heart of the city of San Francisco many years ago. This was renowned for its massive proportions, consisting of three large, tree-like trunks, each ahout a foot in diameter, from a short base, or main hody, nine feet in circumference. This grand sentinel stood guard by a spring on the eastern slope of Russian hill, under whose shadows the early emigrant of '49 campsd. Groves of them hid the marshes of the lower portions of the city; but they are gone, as perhaps most of their companions soon will he, forever. So, also, along the hanks of Lohos creek, and elsewhere, it was no unusual sight to see trees one to one and one-half feet in diameter, and 35 to 40 ft. or more high; yet evsn these, which any tolerably enlightened self intorest would have preserved, a wanton water company cut away; nevertheless, we have an abiding faith that it will not always he so. Let us turn our eyee from the pit of our own and others' errors. Full of the charm that fascinates, in communion with nature, is not the gay flower, the handsome leaf, nor any symmetry of form in outline, mass or detail, nor grace of motion, waving with the wind nor rustling in sympathy wheu astir and softly pillowed by the gentle zephyr; nay, hut whatsoever hath paramount power to move most deeply the affections which underlie all the hlandished arts and airs—and these aré those sweet aromas that wake the soul to love. They come down anon with overwhelming power in our inspirations of ethereal autumn airs, when all the landscape is brown and hare, when the cloud curtain of the faded year is ready to drop on all that was beautiful and fair to view without, overshadowed the divinely human, transfigured, we feel that it is good to he there—are ready to pitch the tents of peace and dwell therin forever. But, returning, are there not thousands of similar kindred mysteries to myrtle odors in every one's personal experience, that commend them and their like to culture, or what else is it that hallows and charms our affections but sweetness of spirit and other mental quality within, that so blinds us to irregular forms and features of friends, objective or individual, with whom we hold such pleasant converse? Is it not the real soul, or something like it, on the other side heaming through? Or, let us reconsider the ground of our esteem for numberless pets of the garden, fisld and forest. True, one of a thousand may possibly he fairer to us than the rose or the lily, and altogether lovely; if so, we have indeed found at least one of the real trees of natural life, perchance of foliage, flowers and fruits of honor, trees of renown, the planting of Jehovah, that he may he glorified, glorified in man, in that only paradise of the soul, wherein is found celestial joy and gladness and the voice of melody.

As these myrtles ahound in henzoic and tannic acids, resinous matters and fragrant volatile oils, the hark and leaves are esteemed in the arts and for medicine. The wood is used as fuel.

Laurel Hawthorn, or Toyon Tree.
(Heteromeles [Photinia] Arbutifolia.)

"Mark the fair blooming of the Howthorn tree,
Finely clothed in a robe of white."—*Wm. Browne.*

Kindred to the renowned Rowan tree (*Pirus aucuparia*), and sacred to somewhat similar associations, few denizens of the wild woods possess a greater interest than the toyon tree, or laurel hawthorn. A shrub or small tree five to 25 feet high, from a few inches to a foot in diameter; leaves thick and leathery, ohlong or elliptical, lance-like, sharp at the ends and sometimes at the hase, two to four inches long, half an inch or more broad; leaf-stem stout and short, margins saw-toothed, the shallow teeth sharp, usually tipped with a gland, color rap-green above, and lighter yellowish green heneath. Seen ahroad, along the sandy coast, it is more dusty and sombre; but massed or clumped on our hillsides, hending over the hrow of the cliff, or perched on the point of rocks looking seaward, this winter-green shrub glows in livelier, lighter hues than oaks, and a thousand other surrounding foliage; this hecomes still more conspiciously manifest as it climbs the dry hills, and is again altogether a rounded shrub. The numerous little white flowers, hawthorn like, or less than half an inch across, are in large compound clusters of a span or so on the ends of sturdy twigs; petals or flower leaves are roundish and slightly scolloped, on short claws, five-toothed cup, short and thick, becoming still more thickened and imbedded on the end of the fruit, like partridge herries or tiny twin hsrry (*Michella*), huckleherrie, wintegreen, etc.; stamens, ten—two opposite each tooth; central styles two, more or less united; at length the bright scarlet berries, which all along late summer and autumn have hesn a little turhaned, or remotely pear-shaped, swell out nearly globular, and are less ohlong. These are usually about the size and color of wintergreen herries (*Gaultheria procumbens*). In the recent state these heautiful herries have but little odor, but when dry the piquant, spicy odor is exceedingly refreshing; and nothing is more lasting, abiding still fragrant, we know not how many years, hut apparently increasing with age. The hsrries eaten from the tree have a pleasant, thorn-apple (*Crategus*) flavor. They are parched hy the Indians, and eaten so, or ground and used as a kind of coffee, or thickened into mush, or made into hread, cake, or the like, when it has a peculiar nutty flavor. It hlooms chiefly from June to August; yet here and there fine clusters of flowers may he found at any season of the year. The thickly-set, laurel-like leaves extend close up to, and lesser ones in among the flowers. It fully ripens its great masses of bright red berries about merry Christmas, hence it is often called "Christmas tree," and the fruit "Christmas herries," in part from this coincidence, but mainly hecause of its universal devotion to those religious and rural adornments that will ever associate the concomitant Toyon tree with all the innocent social festivities of that season, and of the "happy New Year." Yet, withal, to the unhiased eye of srt, and to the appreciative landscape gardener, the hrilliant contrast, soothing warmth, and harmony of hright red on a hackground of green—ruhy in emerald, and at such a season of the year, too—will always commend this Laurel Hawthorn as one of the chief ornamental charms of the coast. Even the faults of the formal and rigid become merits when they contrihute to the wiuter scene an air of calm, serious stillness, in peaceful keeping with the general hush of the great mother, while her large family is sleeping. Nor is this equanimity ever disturhed at seasons claiming less attention—the constant gales that deform the sturdiest oaks and other hardy trees and shruhs, pass harmlessly hy the Laurel Hawthorn and the Satin-tassel trees, and hut few besides, little, if at all, the worse for the fierce war waged on them during our wintry summer winds.

The hark has a cherry, or pleasant hitter-almond flavor, and possesses similar medicinal virtues, which, indeed, would well nigh fill a volume to delineate in detail. The wood, especially the root, is highly ornamental, hut has hitherto attracted little attention.

*From "The Forest Trees of California," by A. Kellogg; published by the State Mining Bureau. State Printing Office, Sacramento, 1882.

A Very Rich Find.—Dr. Bishop has brought into town a number of specimens of ore from Black Point, in the Diamond range, ahout six miles heyond the Cottonwood ranch. The ore is of different kinds, some carrying considerahle copper, and others containing no copper at all, hut all being "lousy" with hlack silver. Ben Levy had one of the specimens assayed, and found that it went $1,040 in silver. The croppings from which the specimens were taken are wide, and rise almost perpendicularly above the surface to a considerahle hight. The miner from whom Dr. Bishop ohtained an interest in the claim, it appeare, worked on the mine at another point some nine years ago, hut ever since then it has heen lying idle. The find seems to he a remarkably valnahle one. There are thousands of prospects from the croppings of which good assays are made; but when croppings are found nowadays that assay over $1,000 it recalls the days of the Comstock discovery. —*Eureka Sentinel.*

A Smelting Proposition.—For many years the reduction of the hase ores of Meadow Lake have haffled the finest scientific skill brought to hear on the proposition. The principal difficulty has heen found in the extreme hardness of the rock, which is essentially iron oré. The gold in it is coarse and plainly visihle, hut mining and reducing the ore is too expensive for profit. An iron-working company of Burlington, Iowa, now proposes experimenting with it, working and emelting it as they would iron ore, precipitating the gold while the iron is in a liquid state, so that it will he found in the poiot of a cone of the metal when cooled off.

Prospectors That Hinder.

It is a matter of complaint in many of our mining exchanges throughout the Territories that propectors, as a rule, are inclined to ask prices, in excess of real values, for undeveloped claims, and that the progress of the various camps is thereby very much retarded. It is one of the inherent failings of human natnre to dslnde itself with visionary views of the futnre and of the unknown. No matter how prosaic the present, how unhappy the past, so long as youth and strength remain the phantom of hope points ever upward to a to-morrow that compensates for all the previous ills of this life. How many men have died vainly waiting for the to-morrow that never comes? How many men are there now growing gray in adversity, biding the period when they shall become the possessors of houndless wealth, and how few, alas, will ever reach the goal of their high aspirations! The fever which hrings the restless spirit of the gamhler hack to the fatal board is not more mischievous in its results than the delusion of the prospector who finds his every prospect hole the portal to a bonanza.

The man who hecomes possessed with the idea that all finds are mines is a public nuisance; he is a metallurgical crank and an obstructionist of true progress. He may, perhaps, he the possessor of no more earthly goods than he carries from camp to camp on the hack of his patient hurro. His scanty garmente may illy protect him from the chilly winds; his empty stomach may frequently remind his empty head of the futility of his lofty hopes; life may he to him a hittsr struggle for existence; he may be estranged from the sympathy of his kindred and his kind in the pursuit of the will-o-the-wisp of mocking fortune, and yet he will go on, from year to year, plastering whole sections of country with his locations, and feebly trying to cheat himself with the helief that in his perpetually troubled journey to an impecnnious old age and the poorhouse, he is laying the foundation of a colossal fortnne.

This is the kind of man who ever acquires and never sells; who, without the means of decently developing a single claim, is the happy possessor of scores; who is contemptuously indifferent to sums that are not reckoned hy thousands, and who must run his race until death shall sstablish a claim upon him before his many prospects can ever be prohsd to ascertain their worth.

In the face of the facts that out of the hundreds, aye, thousands of prospects that have been discovered in every mining sction, the good paying mines of a whole Territory may he counted on the fingers of one's hand; that out of the vast army of men who have ever turned their faces to these shores in the quest of gold, the successful ones numher only a few. The prospector of the kind we have in our mind's eye never applies these unalterahle and unanswerahle mathematical certainties to himself. He never counts the woeful number of blanks in the lottery in which he posssses so small a chance.

We do not say these things in discouragement of the calling of the prospector, hut we emphatically accentuate them in discouragement of the senseless practice of the prospector who permits himself to become a deluded visionary and ohstructs the progress of the country hy stubhornly refusing to yield up his properties for a fair remuneration to the men who alone can make of them things of profit or hsnefit to ths present generation. We intend to sharply censure, not the man who asks a fair return for his lahor, hut the wandering vagrant, who owns and never develops, who claims and never releases, and whose whole course of existence is illustratsd hy the old fahle of the dog in the manger. If prospectors have claims which they helieve to he good, their own interests should counsel a concentration of their energies; they should sell one, two or three of their claims that they may develop a fourth. They should not waste the years in unending search, and scatter their interests over the whole area of the Territory. They should realize that $500 worth of work on a single claim is far more likely to result well than that amount expended on a half a dozen, and they should hear constantly in mind the truth that the man who finds the greatest enjoyment of this life is he who never postpones his happiness to an indefinite future.

The whole country is interested in the rapid development of its mining industries hy capital and associated lahor, and it is impatient of the delay which the indulgence of our mining laws grants the prospector. The attempt has heen made to ahrogate the evil of which we have complained hy the perpetration of an injustice, and though the enactment of laws which would virtually sweep away possessory titles, and with them the poor prospector, has heen postponed, it threatens a resurrection. The principle that rulee in Mexioan laws, that the continuous working of a mine hy its owners is a public duty, is infecting our own people. Its recognition in the laws of our sister republic was the growth of causes now operating with us toward the same end. Popular clamor is likely to demand speedy limitation to the tenure of mining property that is not worked, and the prospector who does not now limit his possessions, or who refuses for them fair terms, may find too late that the law has interposed and wrested them from him.—*Oroville Courier.*

The Mayor and City Council of Leadville, Col., have heen arrested, fined and imprisoned for contempt of court.

Go Slow.

A Genuine Comstock Stock Boom Not Likely to Occur Soon.

The slight rise in mining securities within the past few days, says the Eureka *Leader*, has induced the papers at the hay, devoted to the mining interest, to renew their oft-repsated (and of late never fulfilled) prophecies of the near advent of a genuine stock hoom. They tell of encouraging news from the north end, and hint at developments in the middle mines. Were it not that the south enders are water-logged they would undoubtedly repeat the yarns that the dupes used to give such implicit credence to, in regard to rich strikes having heen made in that section months or years ago and then covered np, to he developed when the insiders had corraled all the stock at their own prices. The average stock speculator used to he the most credulous mortal in existance. It has taken oft-repeated stock cinches to destroy his faith in these covered up honanzas. In fact there are a few of the old guard still left who really helieve that the honanza firm know, hy actual demonstration, of large and paying deposits of ore in Gould & Curry and Best & Belcher, and no amount of reasoning or argument can shake their faith. To these the recent arrival of Senator Fair and John W. Mackay on the coast is proof positive that the long-looked-for time for opening up the honanza in the middle mines has at last arrived. Another and larger class of operatore see in the arrival of these gentleman an assurance that there will he an upward movement in the stocks in which they are supposed to be interested, whether there is merit to hack such a raise or not. The recent purchases of these two classes of oprators has undoubtedly caused the present appreciation in Comstock shares.

The time has gone by for a stock hoom to be created or maintained on anything except actual and proven development. The arrival of Mackay and Fair may create a little spurt in the sscurities, but without paying ore and plenty of it, the spurt will he very short-lived, and will result disastrously to those who put their faith in a market on the presence of these magnates on the coast. The day for working the mystery dodge has passed. Fair worked out that lead in the last Sierra Nevada excitement. The mines are too hot to keep the miners imprisoned under ground when a strike is reported to have hesn made, and when a shift comse to the surface some of them will give away the truth—for a consideration. There are plenty of men in San Francisco who are as fully and speedily advised of the true status of the Comstock mines as the honanza firm. These men know when a market is heing worked up on jaw-hone and mystery, and when it gets up to the proper altitude make their money on the short side of it.

So far at least, the development in Union and Mexican consists in some "kidneys" of ore varying from five to twenty ft. in width. The mineral-hearing vein in this part of the lode is from 100 to 500 ft. in width, and these ore kidnsys are scattered through it like plums in a pudding. When these kidneys expand to a width of 100 ft. or more of paying ore, and of reasonable length, then operators will helieve that another Comstock honanza has heen opened np and a genuine hoom will he inaugurated. Until a development which is undeniably valuahle and extensive is made on the Comstock, the presence on the lode of all the honanza magnates, living or dead, rich or hust-ed, cannot create a "hoom" that will result other than disastrously to those who get on the "long" side of it. When a bonanza becomes a fixed fact there will he far hetter and safer chances to make money in stock spsculations than to dip in now just because Mackay and Fair have come hack.

Times at Alaska.—A prominent mining man received a letter from Harrishurg, Alaska, yesterday, written by an intelligent observer, which gives anything hut a rose-colored acconnt of things in that snowy land. The letter was dated June 28, and at that time there was not less than 15 ft. of snow in any part of Alaska five miles from the coast. A cold rain and fog eternally prevails, and it is almost impossihle to do anything out doors. A number of pilgrims went up there with high hopes and slender pocket-hooks during the months of May and June, and they are now the most disgusted lot of human heings to he found on the continent. There is no work for them to do, and they are nearly all dead broke, and have no way of returning to a land where their lahor is collateral for money. Prospecting is out of the question, as there are no roads or trails through the country, and the ground, when the snow is off, is covered with a thick, tangled undergrowth of shruhhery that impedes progress. The only way to penetrate the interior is hy means of canoes on the rivers, and then when the prospector disemharks, he encounters the same difficulty from the hrnsh and shruhhery that thwarted him near the coast. The writer is decidedly of the opinion that he who leaves Arizona to make his fortune in Alaska is not endowed with good sense. There is one little five-stamp mill running on Douglas island, ahout three miles from Harrishurg, and that is the only reduction work in the Territory.—*Tombstone Epitaph*

From a quartz ledge not 10 miles from Placerville, during 4 days of last week, 64 ounces of gold, valued at $1,100, was crushed out in an ordinary prospectiug hand mortar.

MECHANICAL PROGRESS.

True Value of Mechanical Skill.

A subject that appears well worthy the attention of the apprentice and the young mechanic is the actual difference between the value of thoroughly skilled and competent labor, and half-skilled and incompetent labor. At first thought it would seem that if one mechanic was capable of doing two-thirds as much work as another; that in order to do exact justice to all parties, he should receive just two-thirds as much in the way of wages. In point of fact, however, there would be no justice at all in such an arrangement. In order to divest the matter of the wages aspect, let us suppose that two individuals enter into partnership, and that the better workman can perform labor representing $1,500 per year, and the poorer one two-thirds as much, or $1,000 per year. Suppose further that they find the interest on the plant required to conduct the business, sinking fund and incidental expenses to be $1,200. Since it is evident that each will occupy the same amount of room, and that each will require the same tools with which to work, it is evident that the $1,200 in the way of expenses should be equally assessed, and that the amount to which they would be equitably entitled in the way of wages would be $900 and $400 respectively. In other words, the one who does one-third more work than the other, is in strict justice entitled to two and one-fourth times as much as the first. Now, the matter would in no sense be changed, if, instead of working for themselves, they work for a third party. It is a consideration of this fact that leads far-sighted employers, especially in a business that calls for large expenditure in the way of tools, etc., to look for very competent men. It is always apparent that the mechanic who has given the greatest amount of energy to thoroughly comprehend and manage his business is always the one who has work and good wages, without much reference to the times. There is no reason to doubt that the difference in this respect will be more marked in the future than in the past. In other words, the mechanic who, by any means whatever, fits himself to do more and better work than another, will find himself recompensed in a much greater degree than would be indicated by the extent of his superiority. In this, as we have proven, there will be nothing but exact justice to all parties. At the present day there are greater inducements for the young mechanic to improve and perfect himself in his trade than ever before. The absolute value of skill, from a business point of view, is beginning to be fairly appreciated.—*Blacksmith and Wheelwright.*

A Novel Locomotive.

The compound locomotive recently invented by E. W. Webb, superintendent of the London and Northampton road, is attracting some attention in this country. Its purpose is to economize fuel by the use of both high and low steam. There are two sets of driving-wheels, which are not connected, but each set is driven by independent engines. The steam is first received, under high pressure, in two cylinders placed on each side of the boiler, and about half-way back. The pistons of these work the rear drivers by direct motion. The steam from them is then exhausted into pipes which are conducted in front of the boiler-flues to keep the steam hot, and then into one large cylinder located directly under the front of the boiler. This cylinder carries, by a shaft under the boiler, the forward drivers. A saving of over 25 per cent. upon the ordinary requirements is made in coal.

A fuel-saving engine is also being tested on the St. Louis & San Francisco Road, known as the down-draft engine. This engine, a few days ago, on a trial trip, attained a speed of 50 miles per hour. To this engine is attached a smoke-consumer and smoke arrester. The recent trip was from Springfield, Missouri, to the mouth of the tunnel through the Boston Mountains at Winslow, in Arkansas, and from there to Wichita, Kansas, returning to Springfield, a distance of 750 miles. No smoke was observable while the engine was working, though some could be seen to escape when the steam was shut off. Spectators rode for 150 miles on the front platform, next to the tender, without inconvenience from the smoke or cinders. The 'Frisco people say that the consumption of fuel was at least one-third less.

WOOD CARVING.—The growth of wood carving in New York city for the last few years has been enormous. It has increased ten-fold in as many years. The fine residences which have been erected in the city during the past year have had an unusual amount of carving done on and in them. Nor is excessive wood carving popular with the millionaires alone, but with people of moderate fortune as well. Taking the whole woodwork of an elaborately finished house, it is estimated that each square foot of wood surface represents a week's work of the carver. Thus it will be seen how much time and labor is involved. For the last four years carvers have been coming from Europe in such numbers that wages have fallen considerably of late. The best workmen get as high as $8 per day, the average being $4 or $5.—*Upholsterer.*

Tempering.

The rapid cooling of heated metal constitutes tempering, and the intensity of its effects increases as the difference in temperature between the metal and the cooling liquid becomes greater. The principal effect of this operation on steel is, generally speaking, an increase in the hardness of the metal; and by heating and cooling in different degrees and at different rates of rapidity, we are not only enabled to obtain the extremes of hardness and softness, but also almost all the intermediate degrees between the extremes. The rapid contraction of the external layer, brought about by cooling while the inside is yet at a high temperature, produces pressure upon the internal layers; and reciprocally, in order to contain the greater volume of the still hot inside layers, the external layers must stretch at the expense of their elasticity. Hence we may, with perfect propriety, conceive of tempered steel as in a condition of continuous internal statical strain, resulting in extreme rigidity and brittleness, and therefore exhibiting the greatest amount of solidity as indicated by maximum hardness and tenacity. This molecular tension results in the "drawing out," or "forging," as it were, of the less rigid internal layers into accommodating dimensions by the pressure from the external layers. This is evidenced by the decrease in specific gravity and increase in dimensions of hardened steel. Gmelin established that the difference between hardened cast steel and steel not hardened is about as 7.6578 and 7.9288. Dr. Percy ("Metallurgy of Iron and Steel") says: "It has long been known that, by hardening, steel expands sensibly, and consequently decreases in specific gravity. Reaumur seems first to have recorded the results of accurate experiments on the subject. 'M. Perrault,' he writes, 'has already observed before us that a steel wire, after hardening, could not pass through the same hole as before hardening. I have repeated this experiment in different ways, and I have always found an increase of volume in hardened steel; but I wished further to ascertain the extent of this increase, and whether it was sufficient to admit of being determined by measurement.'" He did so, and found that in the process of hardening steel increased 1-48th of its volume.

Work.

The young workman who desires to become more than a mere machine, must not be afraid of labor. The suspension of the usual daily work at the bench, lathe or saw, should be the beginning of an intellectual labor that will aid him to lift himself to a higher plane in due time. Of course, we do not think it wise for a young man to tie himself down to study every night, or to toil unremittingly every day. The brain and brawn must have rest, and it is quite as essential that the mind should receive a tonic in the shape of fun and amusement as it is that the body should be sustained, nourished and invigorated; but amusements have their time and place, and should not be permitted to interrupt the studies of the aspiring mechanic. Remember, the only roads to promotion are steadiness, judgment and intellectual advancement. The true rule for a young man is to make himself as useful as possible to his employer. He should never feel satisfied with himself as long as anything in his power to promote his employer's interest is left undone. Success is sure, sooner or later, to crown the efforts of every one who earnestly strives to deserve it, but it is never found by those who rest and play when the eye of authority is turned from them. There is no "royal road to success" in any of the matters of life, and this axiom is doubly true when applied to the mechanical arts. He who succeeds the best is he who is unremitting in his labors. A man who regards work as a hardship, an oppression, can never do anything well. He must take an interest in his work if he would excel.—*Builder and Woodworker.*

METAL ALLOYS.—The *Engineer* says that in a recent work on "Metal Alloys," published in Germany, the author, Mr. Guetlier, gives the following suggestions on the subject of fusing metals: 1. The melting pot should be red hot—a white heat is better—and those metals first placed in it which require the most heat to fuse them. 2. Put the metals in the melting pot in strict order, following exactly the different fusing points from the highest degree of temperature required down to the lowest, in regular sequence, and being especially careful to refrain from adding the next metal until those already in the pot are completely melted. 3. When the metals fused together in the crucible they require very different temperatures to melt them, a layer of charcoal should be placed upon them, or, if there is much tin in the alloy, a layer of sand should be used. 4. The molten mass should be vigorously stirred with a stick, and, even while pouring it into another vessel, the stirring should not be relaxed. 5. Another hint is to use a little old alloy in making a new one, and the melting pots should be absolutely clean and free from any traces of former operations.

A NEW ALLOY, called "Argasoid," has recently been described by Mr. V. Jeuptner, of Vienna. It has been used as a substitute for silver, and its price is said to exceed that of brass by about 50 per cent. Its density is 8.44, and chemical composition as follows: Tin, 4.035; lead, 3.544; copper, 55.780; nickel, 13.406; zinc, 23.198; iron, trace.

SCIENTIFIC PROGRESS.

The Rate at Which Thought Travels.

Who but a Frenchman would ever have thought of trying to measure the rate at which our ideas flow? One has thought of it, and three gentlemen of France have experimented and discovered—not exactly the rate at which our ideas travel, for that is infinite—but the time which elapses between the moment we think of a thing and the moment our muscles are affected to do it; or, in other words, what time it takes for the brain to exert its influence on the senses, and the senses on the brain. We compile the following information from a French journal:

If a cylinder divided into 360° be caused to rotate 1,000 times in a second, it is evident that the passage of one of those degrees before a given point is equal to the 1,360,000th part of a second; this may be divided by a microscope so that a period of time equaling the ten millionth, or even the one hundred millionth part of a second may be measured. By this arrangement it is possible to measure the rate of nervous impulse. Suppose an electric shock be given to the arm, it produces a sensation and a contraction of the muscles; then, by noting the interval of time between the shock and the contraction, the time occupied by the action of the brain to produce the contraction, however quick, will be ascertained. By trying this experiment on various parts of the body, the amount of sensibility of the different leading muscles may be determined.

M. Helmholz, a Swiss gentleman, has made some very interesting experiments, with the utmost care, and has arrived at the following results, which we copy from Prof. Silliman's *American Journal of Science:*

Sensations are transmitted to the brain at a rapidity of about 180 ft. per second, or at one-fifth the rate of sound; and this is nearly the same in all individuals.

The brain requires one-tenth of a second to transmit its orders to the nerves which preside over voluntary motion; but this amount varies much in different individuals, and in the same individual at different times, according to the disposition or condition at the time, and is more regular, the more sustained the attention.

The time required to transmit an order to the muscles by the motor nerves is nearly the same as that required by the nerves of sensation to pass a sensation; moreover it passes nearly one-hundredth of a second before the muscles are put in motion.

The whole operation requires one and one-fourth to two-tenths of a second. Consequently, when we speak of an active, ardent mind, or of one that is slow, cold or apathetic, it is not a mere figure of rhetoric, but an absolute and certain fact that such a distinction, with varying gradations, really exists.

KABATH'S ACCUMULATORS.—Mr. Nicholas De Kabath, of Paris, has brought out a new accumulator which is designed to give a very large accumulating surface. It consists of a number of lead plates connected alternately like the plates of a condenser. Each plate is composed of a set of strips of lead, one-tenth mm. thick. These slips are alternately flat and corrugated, and are placed so as to form a plate 8 or 9 cm. wide, built up of about 100 slips. They are kept together by a perforated lead plate, entirely surrounding them, but permitting a free circulation of the liquid. In forming a cell of the accumulator, Mr. De Kabath puts 12 of these plates into a water-tight wooden case having two terminals, and connects the alternate plates to the terminals. The end plates are plain sheets of lead, thus making 14 in all. The plates are fixed at the top to the wooden cover, and rest at the bottom in a bed of black rosin and paraffine. The cells are charged with sulphuric acid, like M. Plante's secondary battery.

IT IS ASCERTAINED that chalk, whether in an artificial paste or in its natural state, if plunged into a solution of silicate of potash, absorbs even in the cold, a quantity of silica, which may be increased to a considerable extent by exposing the stone alternately, and for many times, to the action of the solution and of air. The chalk assumes a smooth appearance, a compact grain, and more or less of a yellowish color, according as it is more or less impregnated with iron. Stones thus prepared are susceptible of receiving a high polish. The hardness, which, at first, is but superficial, penetrates by degrees into the center, even where the stones are of considerable thickness. They appear susceptible of undoubted utility in the more ready formation of works of sculpture and various ornaments, even those of the most delicate workmanship. Attempts have been made to apply these stones for lithography.

"THE BEDSTEAD of King Og" has been discovered. Lieut. Condor, of the Palestine Exploration Society, suggests that one of the Cromlechs, which are quite numerous in eastern Palestine, may have been the so-called "bedsteed" of King Og. It is maintained by some that the word, translated bedstead, should be throne, and as these Cromlechs were probably the seats of tribal dominion, it is easy to see how the throne or bedstead could be preserved.—*American Antiquarian.*

The Effects of Terror.

The effects of terror, upon man and animal alike have many striking illustrations on record. When exposed to any sudden and great danger, most persons become paralyzed with fear, and are, for the time, rendered incapable of the use of their ordinary powers. The shock upon the nervous system, or the rush of blood to the brain, is the real cause of their helplessness. But we allude to this subject now for the purpose of expressing an opinion in regard to animals, and their conduct when exposed to a danger which they cannot escape.

It is said that the fox, if suddenly caught in a place out of which he cannot escape, will lie down and feign death, till he sees some way of escape, when he will suddenly recover his powers and run away. This is called a trick, and is set down to the credit of his cunning and sagacity. But is it not possible that the sudden discovery of a great danger, which makes death seem certain and near, may produce a sudden stupefaction—a real suspension of the active powers, till, seeing an opportunity to escape, hope revives, and with it comes the restored powers, and an effort to escape is made, and succeeds? That this is the case is rendered probable from the fact that he does not always embrace favorable chances to escape when they are offered to him. Many instances are on record where the fox will remain apparently dead for a considerable time after escape has been made certain and easy, if only the effort had been made.

The wolf is more fierce, but less sagacious than the fox; but when it is taken in a pit from which it cannot escape, the trapper can descend into the pit with impunity, and bind the wolf and lead it away. The elephant, the most powerful and dangerous of animals when at liberty, soon becomes as subdued and patient as an ox when he has become ensnared and taken in the hunters' toils. The lion, the king of beasts, the terror of armed men, when caged and helpless, submits to his keeper. But throw open his iron door, and 40 keepers must not dare "beard the lion" outside his den. All this submission we attribute to a sudden or prostrated terror, which acts upon the brain and nerves of the animal, changing its nature, by a partial or perfect paralysis, till the moment when a sudden hope takes off the pressure, and with a bound they recover their former powers, and their freedom, as well.

ASTRONOMICAL TELESCOPE WORK.—The never-failing variety and interest that characterizes the study of astronomy, says the *Scientific American*, finds ample illustration at the present time. Three important themes demand the close attention of the student of the stars. The approaching transit of Venus comes first in importance. The busy notes of preparation for the event are sounding over the civilized world. Forty expeditions are beginning to carry out their plans. The eight French expeditions start for their stations during the month. All over the United States the observatories are being put in order, and the instruments are being prepared to do their best work, while the astronomers congratulate themselves that the transit has come to them, instead of obliging them to go to the transit. The Martian canals, and the more marvelous observation of their duplication by progressive parallel lines, as seen by the keen-eyed Schiaparelli in the serene atmosphere and under the cloudless sky of Milan, is another theme for study, which may greatly influence the present theory of Martian physics. In the third place, the moon comes in for a large share of attention. The French astronomers have discovered indications of an atmosphere; and unexplained appearances on her disk, before and since the eclipse, confirm the observations made at that auspicious hour. The transit of Venus takes more tangible form as it draws nearer; the Martian markings are a wonder to the men of science, and the moon, apparently the abode of death, gives signs of life. Meantime the four morning stars sing together as they move in rythmical harmony around the central source of light and life, and the three evening stars fulfill their course, the peerless Venus reigning supreme over her brother planets and the grand concourse of attendant stars.

A DISCOVERY OF A GRAND HALL, NEAR THE PANTHEON, AT ROME.—A grand hall, exceeding in length the full interior of the Pantheon, and supposed to be the vestibule of the Pantheon itself, or, rather, a connecting hall between the Pantheon and the Baths of Agrippa, has been recently explored. This hall measures 140 ft. in length, 50 ft. in width, adorned with eight splendid tinted columns of Phrygian and Numidian marble. Within this hall is a niche, where is a pedestal 12 ft. wide by 11 ft., large enough for a colossal group of sculpture. It is supposed that within this hall stood the celebrated bronze "Athlete" statue, which Agrippa brought from Greece, and placed in the portico of his warm bathe.

MODERN MASTODONS.—Recent discoveries in Indiana give a much more recent date to the mastodon than has been generally assigned. In one skeleton the marrow of the huge bones was still capable of use, and the kidney fat was replaced by lumps of adipocere. In another, found in Illinois, there was every evidence that it had lived upon the vegetation of the present day—upon the grasses and herbs that now grow in the vicinity.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Bodie Tunnel, July 19th, $2,000; Eureka Con., 10th to 15th, $20,619; Christy, 18th, $2,297; Northern Belle, 17th, $10,934; Standard, 17th, $13,997; Star, 17th, $3,613; Christy, 22d, $4,368; Northern Belle, 20th, $8,294; Tiptop, 21st, $16,600; Ophir, 21st, $12,318; Horn Silver (for June), $2,580; Horn Silver (in June), $282,400; Bodie Con., 26th, $10,537; Horn Silver, 19th, $20,000; Frisco, 19th, $2,494; Stormont, 20th, $7,500; Mammoth, 20th, $3,520; Jay Gould, 21st, $1,373; Mayflower, 21et, $3,633;

ONE of the objections raised to the extension of the operations of the geological survey is the prohable enormous cost. The total amonnt of money appropriated by the general Government for geological surveys during the past 15 years is $2,428,528.37. With this amount 672,580 square miles have been surveyed.

THREE American prospectors have been found murdered in Sonora, and it is thought they were killed hy Mexicans.

The Mining Share Market

Prices have been down for the past week, with comparatively few sales. The Virginia *Chronicle* says: The cause of the depression is accounted for in various ways. A leading broker of this city says that the canse of the decline is on account of many people huying stock during the past month on the strength of Messrs. Fair and Mackay coming hack to the coast, helieving that their presence would have a tendency to improve the market; but after bolding the stock and seeing no improvement, they threw it on the market, and thus cansed the decline. The only prospect for a boom now is centered in the Mexican.

The *Enterprise* says: The principal point of interest at present is No. 1 winze on the 2700 level of Mexican. This winze is now down about 60 ft., and the ore now extends across the hottom. It still stands almost vertical. It will prohahly he followed down to the 2800 or 2900 level hefore a crosscnt is made upon it.

The raise going up from the 2700 level of the Union Con. is passing through numerous streaks of ore, all of which are supposed to lie west of the main ore hody. When this raise has been connected with the 2600 stopes the amount of ore extracted will he materially increased. This week the amount of ore taken out will he about 400 tons.

On the 2900 level the joint Union and Sierra Nevada west crosscut is cutting many streaks of low-grade ore. As far as explored, the 2900 level is more promising than the 2700, in that it shows more quartz. The same may he said of the 2900 level in the Mexican and Ophir ground, as well as in the Sierra Nevada and Union.

At the joint Ophir and Mexican winze, on the 2900 level, a hoisting engine has heen set up, and is now running. Hereafter progress at this winze will he rapid, and it will soon reach the 3000 level.

At the Best & Belcher and Gould & Curry they have now their line of pumps down to the 2500 station, and next week active explorations will he resumed.

At the Chollar-Norcross-Savage shaft they are also putting in a station, preparatory to starting a drift to the westward. Not much can he done in the middle mines until this drift connects with and drains out the vein.

At the sonth end the Alta folks will repair the hroken hed-plate of their main pumpiug engine as soon as possihle and resume operations. This is thought to he hetter than to undertake at the present time to set up new machinery.

THE TANITE CO.—Some months ago the Tanite company received an order from one of the foreign governments for a solid emery wheel 36 inches in diameter and 8 inches in thickness. A wheel of this size weighs ahout 800 pounds, and its list price is $500. A few weeks since the company received a cahle order from their Liverpool honse for a special machine on which to run this immense wheel. They are now constructing this machine, which is the largeet they have yet huilt. It is from an entirely new design and will weigh, when completed, 2,200 pounds. When finished, illustrations of this machine will appear in some of the scientifio papers. The company received last week an additional order from the same government for nearly $3,000 worth of solid emery wheels. Notwithstanding the recent enlargement of their works and increase of hands, they are kept husier than ever.—*Jeffersonian, Stroudsburg, Pa.*

JOHN JAMES, a miner, was ornshed to death in Plumas county lsst week.

A DELIGHTFUL PLACE OF RESORT—WOODWARD'S GARDENS.—Jnst at this present season the most striking similitnde to an earthly paradise that we know of is Woodward'e Gardens. As the visitor gazes aronnd npon the immense nnmher and variety of flowers, shruhs, plants and trees, and observes their peculiar color, foliage and fruit, and calls to mind their varied useful, alimental, medicinal and ornamental purposes, he is completely lost in wonder, thst so mnch and such varied products, from almost arctic to snh-tropical, could have heen brought together and made to grow and flourish in so small a space. And, when added to this, we hear in mind the complete zoological museum, comprising almost everything that walks, flies or swims, we have here a school of hotany and natural history that is rarely met with, even in the oldest and most advanced cities of Europe. No visitor, especially no family with children, should ever spend any time in San Francisco without devoting one day at least for a visit to this famous place of resort. Those who are fond of amusements may also here he gratified to their heart's content hy selecting the proper days for the performances in the spacious pavilion with which the place is provided. Saturday is geuerally a leisnre day, and always a good day to go to Woodward's.

NEW METHOD OF PIANO TEACHING.—Mr. John Cooper, of this city, has issued a very nseful hook, which will he appreciated hy all who have ever taught the organ or piano, and will he appreciated also by those who are learning. It is particnlarly applied to teaching the soales. Each major and minor scale is given in musical sigus in the usual way, and under eacb is a graphic representation of the key-board, so marked as to indicate to the eye the proper notes to he struck in running tbe scale, and also the fingers to he used for each hand in each note. The diagrams will impart to the young stndent a correct and practical knowledge in fingering and facility of performing. They are hased on the knowledge that the young intellect may he reached more easily through the eye than the ear. It is really teaching music hy pictorial illustrations, just as other things are tanght hy illustrations. Each diagrsm is self-explanatory, and presents to the pupil at a single glance much more information than can he conveyed hy many paragraphs of descriptive matter. Each diagram for its respective scale tells which note to hegin and finish on, which are the proper sharps or flats for the key under consideration, and also the proper fingering. There is a short introduction on music, the notes, etc. On the diagram, round marks indicate naturals; square ones, sharps or flats; fignres on the rounds or squares indicate the proper fingering. There could he nothiug simpler than this, and it will he a great help, indeed to hoth teacher and taught. It is a decided advance step. Mr. Cooper has secured a patent for his method through Dewey & Co.'s agenoy.

MARIPOSA GRANT MINES AGAIN.—The Mariposa *Herald* says: The people of Bear valley feel highly elated over the prospect of the mines on the Grant soon starting up again. In fact, this is the general topic of conversation all over the county. There are no hetter mines in the State than those contained in the Grant, and as far as the present financial condition of the company is concerned, we do not see anything to hinder it from now starting up the mines.

THE Central Pacific railroad is ahout to erect new machine shops at Wadsworth. The huildings will he extensive, and are to he located on the opposite side of the river from town.

MINING SUMMARY.

The following ie mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

CALAVERAS.

UPPER COUNTRY MINING NOTES.—*Chronicle*, July 23: The Champion mine is being steadily worked. The main shaft has attained the depth of 815 ft, having been sunk 115 ft since operations were commenced.....Messrs. Rose & Jenkins are taking out splendid quartz from the old Henry lode and other mines in their poeeession..... The main shaft of the Star of the West mine le developing a splendid lode. Considerable gold can be seen with the naked eye.....Mr. J. Gouldson ie running levels on the old French lode, at Bummerville, on rich quartz. Stoping will commence in a week or so, when we will look for something hig.....Buehman & Co. are still running their tunnel on the Canada mine.....Mentzel & Co. are stoping out good rock from the south extension of the Rattlesnake mine. The last rock taken out paid $28 per ton.....Mr. Sterling ie sinking on a rich chimney of quartz on the Pride of the West mine.

GLENCOR MINING NOTES.—Work is progressing in the Le Franka mine, which is being worked by W. A. Roberts. Formerly a shaft had been sunk to a depth of eome 60 ft, and it connected with a tunnel of about 150 ft in length. The rock had been teken out down to the tunnel. Since Mr. Roberts has taken the mine in hand, the old shaft has been continued down from the level of the tunnel, having now attained a depth of 90 ft. At this depth the vein is from 2½ to 3 ft in width, and the ore will mill upwards of $50 per ton.....The mill at the Valentine mine is not at present in operation, but the work of getting out ore in the mine ie being steadily prosecuted. The report that the mine had shut down is untrue.....Work is still going on in the San Pedro mine.

MAKING PROGRESS.—Pumping at the Corral Flat miue has been steadily kept up, and the water in the sheft reduced at the rate of 5 or 6 ft per day. For the past few days no hailing was done, only the pump was kept running, but it is the intention to go to bailing again, when the water will be reduced much faster than by the pump alone. There is at preeent about 50 ft of water yet in the shaft.

CLEAN UP.—*Mountain Echo*, July 23: Potter & McCauley have made 2 clean-ups from their mine recently, which yielded over $800. They usually run about 2 weeks with 2 arastras. A man who has been working in this mine for the past 3 years, and has really done more than any body else, says that the vein is from 9 to 12 ft wide, and the average yield of the ore is at least $16 a ton He says, further, that it is his opinion that there le over $50,000 worth of ore now in sight.

SILVER.—The Jones mine is now regarded by the miners hired there, as the richest mine ever discovered in Calaveras county, and experts from Virginia City, Arizooe, New Mexico, and other noted mining regions, pronounce it an immensely rich silver lead—a real bonanza. The hoisting works are completed, and work will now begin in good earnest. A large mill will be erected as soon as arrangemente are perfected. The most incredulous have become convinced that this mine is a success.

J. C. MAYON, a mining expert from San Francieco, visited this town last week for the purpose of examining our quartz, and was very favorably impreesed with the outlook. He examined the Excelsior mine, owned by John Meyers, with, as we understand, a view to purchasing it ehould the proepect prove satiefactory.

THE Monarch mine was sold at San Andreas, last week, to eatisfy a judgment that has been standing against it for eome time. B. R. Prince, of Altaville, was the purchaser.

GEORGE OSBORN & CO., owners of the Gold Hill mine, struck a rich deposit last week, from which they panned out over $900 in about 2 days, with a fair prospect of getting considerable more.

MINING experts are numerous in this section just now, most of whom are highly pleased with the outlook. This ie well, for time will prove thie to be one of the richest mining sections on the coast.

EL DORADO.

PROGRESSING.—Georgetown *Gazette*, July 21:—The mining enterprise, begun last season under the management of Mr. Hezlett, at Alabama bar on the upper American, an account of which we published last summer, is, Mr. A. J. Wilton informs us, progressing favorably. They are now sluicing off the surface of the bar, and in a few days expect to have their derricks at work lifting the gravel into the sluice boxes. The derricks are worked by hurdy power.

MARIPOSA.

YOSEMITE.—Mariposa *Herald*, July 23: J. F. Thorn, superintendent of the Yosemite mine, was in town a couple of days the first of the week, and made us a friendly call. The mine still holds its own in the same manner it has for months past, and it is no doubt one of the best of its kind in the State.

HITE MINE.—Interesting developments may be expected in this mine before long. Although apparently but little hae been going on there for the past few months, big work has been done on a shaft that will tap the richest vein of ore yet discovered in the mine. Some months ago the company commenced sinking a shaft of 500 ft, and at the present time have it down about 350 ft. When this ie completed, which will occupy but a few weeks more, we may look for cheering news from that quarter.

MONO.

GREAT SIERRA.—Homer *Mining Index*, July 22: Fine progress is being made in the Great Sierra tunnel, 22 ft having been added to its length since last report. The formation in the face is a porphyritic slate, which the Burleigh drills pierce with great rapidity, and all the machinery is in excellent condition and working admirably. The shaft being sunk on the Sheepherder lode is now down 47 ft, all in fine ore, with 5 ft of solid ore of high grade in the bottom. The new office building, 40x40 ft (in the form of a cross), will be ready for occupation on Monday next, and everything about the mine and its different workings is in fine ship-sbape.

NEVADA.

A BRIGHT FUTURE.—*Foothill Tidings*, July 23: The mining situation looks favorable for this county, and mining men and mine owners seem confident of a bright future. We hear of new prospects every day, and work is being resumed on many of the old claims that were abandoned years ago because the owners did not have capital enough to prospect them, or because mining machinery, in those days, was incomplete in the way of saving gold. There are many mines in and around this district that are idle because they would not pay 20 years ago, and which, with the modern improvements in milling and mining, can now be made to yield dividends. The good and paying things, however, will come about in good time, and in the meanwhile prospecting is being diligently proeecuted and general good news comes from all quarters.

GRASS VALLEY DISTRICT.—The Idaho is looking very well, indeed, and expects to have a good run this month. The ledge in the 12 and 13 levels is large, solid and rich in quality. About the best thing we can say about this mine is that it has paid over $3,000,000 in dividends, this last dividend declared being the 157th by this company. Work is still being pushed forward for the 14 level, which will soon be reached.....The East Eureka (O'Connor) has the water pumped out of the shaft, and the miners are engaged in running the lower west drift, which is now in about 175 ft. As soon as the drift is thoroughly opened up the ore will be crusbed.....There is a large force of men now working in the Empire, as large, we believe, as at any time during that mine's existence. Ore from the 5, 8, 10, 11 and 13 levels looks well and keeps he mill going day and night.....The New York Hill has

just paid dividend 17. On June 18th there was $15,339.40 in the treasury, and the statement for July shows that there is a surplus in the treasury of $15,293.42, and this after paying the dividend and all expenses. Drifting and stoping is being done in the mine.....The rock in the Washington mine is gradually improving ..The Ford & Mullen mine, near the New York Hill, is still keeping up its lick of turning out the richest sort of specimens. .....The Gold Point company is having a crushing at the East Eureka mill. About 100 tons will probably be put through the mill.....The imperial shaft is now down 123 ft, and has not encountered water. The ledge looks as well as at any time during the sinking of the shaft. It will not be cut until water is reached. .The Gray Bound company is still sinking on its ledge. The ground is good and the ledge looks well.....The Greeley Blackman company is clearing out its tunnel, and has laid about 100 ft of car track. Two men are engaged in this work and will soon commence drifting for the ledge.

NAVADA CITY DISTRICT.—The *Tidings* reporter took a ride to the Banner and adjacent mines on Wednesday last. This is an old and well-known mining part of the county, but as yet comparatively little work has been done upon the various veins in that section. The new incline shaft on the Banner mining property, about 1,000 ft east of the old works, is now down about 500 ft .....Just above the Banner, on the opposite side of Little Deer creek, on what is known as the Butterfield ranch, some parties are prospecting the old Forest ledge. Mr. William Trenin and partner have now got possession of the property, and have erected a boarding-house and blacksmith shop thereon, and are now actively engaged in running a tunnel, at a point below where the old tunnel enters the hill, which is now in about 350 ft. It is thought that when this tunnel attains a distance of 450 ft, it will cut the old Forest ledge at a depth of about 100 ft. Some quartz, taken from the ledge in the old tunnel, looks well and gives ample encouragement for prospecting. About 18 tons of ore was crushed from the ledge which the present tunnel will strike, and it yielded $70 per ton.

PLUMAS.

TAYLOR-PLUMAS MINE.—Greenville *Bulletin*, July 20. On Friday a visit was made to the Taylor-Plumas in company with a mining man of many years' experience. Since last visit the upraise has been carried 80 ft above the tunnel; at this elevation a new tunnel was started and has been run into the ledge about 40 ft; the mountain here is very steep, and with every ft of advance there is a rapid gain in the amount of backs; if the face of the lower tunnel were as far advanced as is the upper one there would be not less than 300 ft of backs; by advancing this could, of course, be increased indefinitely. In the upper tunnel the ledge is from 4½ to 5 ft wide, and continues to be well defined, with good hanging and footwalls, from which the ore has a thin, clay parting. From the face of the ledge at various points portions of ore were taken and then prospected outside the mine, the prospects were good; every piece, however small, giving several colors. On the dump at the mine is a large quantity of ore; from this any one can pick up at random any number of lumps that show free gold. The ore is of good milling quality, solid, brittle and free from clay that would gum up a battery and prevent the ready amalgamation of gold.

GREEN MOUNTAIN.—From the Green Mountain there is nothing new to report; on Friday the big mill was found to be stopped for a short time when we were there, in order that connection might be made for driving some of the rubbing machines just set up; those already in use are giving entire satisfaction, except to the Italians who work over the tailings; these complain that when all the machines are in use their arastras will no longer pay to take care of them. A marked change has lately occurred in the character of the gold found in the Green Mountain ore; the amalgam is found to retort nearly $8 per ounce; a common yield is about $5; this is ascribed to the fact that the gold is coarser and amalgamates better. The ledge from which ore is now taken to supply the mill is 27 ft wide; all of this pays to work, and about 9 ft of it is particularly good.

SOUTHERN EUREKA.—Last week attachments were laid on the mine and mill, at the instance of Cohn, Levy & Co. The property is advertised to be sold at auction in Quincy on Tuesday, August 8, 1882. This concern has been very much muddled for sometime and perhaps this was the only way to get it straightened out. The mine is valuable, if properly managed, but the skill needed to conduct mining successfully is not acquired behind desks or counters in New York. Mackey, Hayward and Hearst learned mining in a very different way.

CHEROKEE.—At the Cherokee mine work will be begun in a day or two to put down the shaft 50 ft deeper than it now is; this will make the total depth 250 ft. There is every reason for believing that this will develop an additional body of ore that will be very valuable; this belief is based upon the known character of the ore in ground already opened. When the additional depth is gained the mine will be in excellent condition, the result of sinking is sure to warrant the expense incurred.

GOLD STRIPE.—For some time past the ore in the Gold Stripe has been so soft that it crushed very easily, the 24 stamps using up 48 tons every day. This made such inroads on the reserves that it has been thought best to hang up half the stamps for the present, till the ledge can be cut in the Kerr level. For this purpose a crosscut was started some time ago, and is now in over 60 ft; the ground works easily, and this crosscut will soon reach the ledge.

TRINITY.

TAYLOR FLAT.—*Journal*, July 23: Mr. J. M. C. Walker, superintendent of the Taylor Flat mine, was in town Thursday and tells us that everything at the mine is looking favorable.

NEVADA.

WASHOE DISTRICT.

UTAH.—*Enterprise*, July 23: Are re-timbering at the top of the incline. On the 2500 level the east drift has been extended 16 ft.

CALIFORNIA.—On the 2700 level the joint Consolidated Virginia east drift is being re-timbered and a drain is being cut. Are still extracting ore from the croppings.

CONSOLIDATED VIRGINIA.—On the 2700 level the joint California east drift is being re-timbered.

SIERRA NEVADA.—On the 2000 level the joint Union Consolidated crosscut has been extended 10 ft.

MEXICAN.—On the 2700 level west crosscut No. 2 has been extended 30 ft. Winze No. 1 has been sunk 5 ft, and is now being timbered up. It is showing some fair milling ore. Are enlarging the station at the joint Ophir winze on the 2700 level to make room for fans and blowers. On the 2000 level the joint Ophir winze has been sunk 6 ft and the hoisting engine has been placed in position.

OPHIR.—On the 2700 level are enlarging the station at the joint Mexican winze to make room for blowers and fans. On the 2000 level the main south lateral drift has been extended 20 ft. The joint Mexican winze has been sunk 6 ft, and have completed placing the hoisting engine in position. There have been 408 tons and 1,750 pounds of ore extracted from the croppings, and bullion to the value of $12,318 shipped.

UNION CONSOLIDATED.—On the 2600 level the south drift has been extended 22 ft. Are stoping out ore. During the week 415 tons of ore have been extracted, and 303 tons and 880 pounds have been sent to the mill.

YELLOW JACKET.—No change to report in the night of the water in the mine; this same continues stationory, and is evidently finding its way to some other mine or reservoir, as the surface water is sufficient to cause the same to rise. At the Winter's shaft, or Sagebrush level, the west drift is being advanced in very favorable looking ground. At the second, or 360 level, we have cleaned out the old station and are working in the west drift from the same; it continues badly caved.

BALD MOUNTAIN DISTRICT.

FREE GOLD.—Virginia *Enterprise*, July 23: Luther Olark and Judge Adams returned yesterday from their trip to Bald Mountain. They are more confident than ever of the richness of that mining district. They brought in with them 500 pounds of several sorts of ore—all sorts, we may say—but it is all, with the exception of some copper specimens, gold-bearing ore. It is light-colored, yellowish and gray quartz, carrying free gold. Jim Coats' claim, in which Luther Clark has a half interest, shows, at a depth of 8 ft, a fine ledge 7 ft wide of rich gold-bearing quartz. The ledge runs north and south across a ravine, with a pitch of about 40 degrees. In the ravine below a shovel of dirt taken up anywhere gives a color of gold when washed out. The ore matter of the ledge, beaten up with a hammer and washed out, yields free gold in abundance. There is a vast quantity of ore in the district, and if the ledges hold good as depth is attained, Bald Mountain bids fair to be the scene of extensive mining operations in the near future.

CAMPBELL DISTRICT.

NOTES.—Lewis *Herald*, July 19: The Hoskin brothers have a carload of ore on the dump assorted and ready for shipment to the Salt Lake reduction works.....Twist Brothers are taking out some good ore from their mine, which will be sent to the Salt Lake works.....A store has been built near the Frisbie mill. Part of the stock has already arrived and the balance is on the way.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, July 22: Owing to the extremely hard ground in the main drift on the 5th shaft level, it has been extended but 9 ft during the week. On the same level, at a distance of 110 ft from the station, crosscut No. 1 has been started for the hanging wall of the ledge, and is now in favorable ground. On the intermediate, between the 2d and 3d levels, the ore body is being sunk upon, and is showing 3 ft of ore of good grade. There is no change of note in the other shaft levels. In the levels above the adit the outlook is very encouraging and promising. All the work in the mine is progressing very favorably. About 64 tons of ore are being sent to the mill daily. The shipments of bullion amounted to $19,290 03 for the week ending July 20th; and the total shipments on July account to the same date have been $44,581 72.

MOUNT DIABLO.—The north crosscut from winze No. 1 is in 44 ft, and shows harder ground in the face. The west drift from the Calhoun winze, and below the 1st level, is showing 10 inches of $60-ore. The east drift on this level has small streaks of ore in favorable ground; assays of the ore reach $150 per ton.

COLUMBUS CON.—The work on this property has been progressing favorably during the week. The formation in the drift from shaft No. 1 continues strong and shows indications of an ore body.

O. K.—Frank Stewart is steadily at work on this mine, and is extracting and sacking ore of high grade. He expects to make a shipment to the Castle Dome reduction works, at Melrose, in a few days. The ledge from which he is taking the ore is about 3 ft in width, and will average $90 per ton. On the hanging wall there are 8 or 10 inches of a much richer streak.

ESMERALDA DISTRICT.

CENTENNIAL.—Esmeralda *Herald*, July 22: The incline shaft of the Centennial mine has now reached a depth of 415 ft. At this point the ledge shows fully as well, if not better, than at any point above. The ore carries a greater proportion of silver in the bottom of the shaft, which argues well for the continuance of pay rock to a great depth. The work of hoisting being done by windlass, which is necessarily very slow, work for the present has been suspended in the bottom of the incline. Messrs. Ball & Groth are now taking out a crushing of ore from the stopes on the 50 ft level, and the dump shows a handsome lot of very rich rock.

CORTEZ.—At the Cortez mine the main force is employed in stoping ore. A few of the miners are prospecting the lower levels, and the development of some very fine bodies of rich ore is the result. Pending arrangements to procure a mill to work the ores of this mine, prospecting will go on.

LEWIS CON.—The shaft of the Lewis Con. has attained a depth of 40 ft. The ledge is much better than at any place above. Assays run up as high as $100 per ton. The west shaft has been cleaned out to the bottom, and a drift is being run to connect the 2 shafts. The dip of the 2 veins shows that at no great depth they are bound to come together. At that point will be found, in our opinion, a true fissure vein of good size; the quality is shown in the 2 shafts to be very fine.

EUREKA DISTRICT.

GEDDES & BERTRAND.—Eureka *Sentinel*, July 23: In the Geddes & Bertrand the ore is traceable from wide croppings that will work $10 a ton, on an average, down to the 50-ft level, where there are large bodies of ore that will work $30. From that level down to the 150-ft level the ore is continuous and of the same grade. In the chamber known as No. 5, on the 150 level, they are putting in 10-ft holes and blasting down the ore in large blocks, which is being broken up and run out to the mill for reduction. The chamber appears to be 100 ft long by 50 wide, and now looks like a large cave with ore on all sides. The mass of the ore is low-grade ($30 ore), with "nuggets" of rich ore all through it, streaks of black metal that will assay as high as $2,000 appearing in some places.

GRANTSVILLE DISTRICT.

STARTER UP.—Grantsville *Bonanza*, July 22: The engines of the Alexander and Brooklyn mines blew their whistles for the first time in about 8 months last Sunday at noon. The water is now being pumped out of both mines as rapidly as possible. It will take a month or more to pump the water out of the Alexander mine. About a dozen men are at present employed by the company.

LEWIS DISTRICT.

EAGLE.—Lewis *Herald*, July 23: The Eagle company paid off Monday.....The force of miners at the Betty O'Neal will be increased to the usual standard in a day or two.....The Star Grove company are negotiating for the redemption of their property, and the amount of indebtedness will be paid in a few days.....T. G. Morgan has been appointed Superintendent of the Morning Star mine, and on his return will assume the management of that property.....The Frisbie mill in Bullion district will start up on "Lady of the Lake" ore this week. This mine has been bonded by Dr. Frisbie and no doubt will be purchased by him.....H. H. Pearsons, President of the Betty O'Neal mining company, arrived Friday evening, and after a thorough examination of the mine expresses himself as more than satisfied with the outlook of the Betty. The management also has his unqualified approval. But little has been done in the mines during the week. The shaft in the Betty O'Neal has been sunk about 12 ft, the water seemingly decreasing. The rock hoisted from the bottom of the shaft carries considerable mineral. The crosscut has not reached the ledge.

SECRET CANYON DISTRICT.

WATER JACKET.—Eureka *Sentinel*, July 22: Samples of ore from the Water Jacket mine, Secret canyon, that assay $175 in silver have been brought in. This mine adjoins the old Page & Corwin, from which over $100,000 were extracted several years ago. The ore giving out, prospecting was discontinued, as limestone formations were not understood at that time. Appearances are that the Page & Corwin is valuable, and the Water Jacket, of course, also. From the Water Jacket, several years ago, 12 tons of ore were shipped to Austin that realized $1,800. This ore was from an incline, now down 75 ft. There are still small stringers of ore going off from the main body, from which the samples mentioned were taken.

SILVERADO DISTRICT.

RESCUE.—Eureka *Sentinel*, July 23: The Rescue mine in Silverado district is closed down at present. An examination shows there is still ore going down from the surface. The failure of the mine must be attributed to extravagance and mismanagement. There are still spots of rich-looking ore throughout the entire property from the surface down to the 400 level. The main incline has been carried down at an angle of 60 degrees, cutting through a very promising ore formation at a depth of 150 ft. A double compartment shaft is down 200 ft, and the facilities for thoroughly exploring the mine through this shaft are very good.....The Queen mine, adjoining the Rescue, is developing into a valuable property. The present workings show two veins, one east and west and the other north and south. At the point of intersection on the 150-ft level there is a body of ore 5 ft thick that will work on an average $225, the richest assaying as high as $1,800.....The Western Globe and Tiptop mines are being opened up with fine prospects. An irregular vein of quartz going down 60 ft, the present depth of workings, is 5 ft wide and contains ore that can be worked by smelting or mill process. There are 150 tons of this ore on the dump that will work $160. There are deposits of black metal in the mine that will go $2,000. A tunnel is being run to tap the vein at the bottom of the shaft.....The Empire series of mines have a quartz vein going down with a barely perceptible showing of ore on the surface, which widens out rapidly as depth is attained. At less than 20 ft a 4-ft vein is disclosed. This property has been sold to an Eastern company, who, it is understood, will shortly proceed with developments.

WHITE PINE DISTRICT.

NEEDS WORK.—White Pine *News*, July 22: Col. and Prof. Joseph Orandelhuyer, of Hamilton, sent the Eureka *Sentinel* a fine specimen of galena ore the other day, with the following characteristic letter: "The within piece of precious stone is from one of Hon. Thomas Wren's mines in White Pine district. The surface from which it comes is as barren for ore showing as a bald-headed monkey. It simply shows that all so-called poor White Pine needs is work with a reasonable amount of capital to prove thousands of prospects that show as well as this prospect. White Pine district is not an exception to the general rule of mineral-bearing regions; that is to say, mines in White Pine will not leave up their precious metals unless they are worked for and gone after."

ARIZONA.

COPPER.—*Alta-Arizona*, July 15: C. L. Rowe and three men left Saturday for the Antler mine, Cedar valley, which they intend to develop in a thorough manner. The Antler is an immense ledge carrying copper and silver, and is within 10 miles of the surveyed line of the railroad.

MR. D. N. RIORDAN, a mining expert, has gone out to Gold Basin to examine and report on the famous El Dorada mine, in the interest of some Pacific coast capitalists. Mr. Riordan is a practical miner, as well as a learned mineralogist, and we hope that his opinion of the El Dorado will induce his principals to invest in that great property.

RICH ORE.—Recent work on the Cupel mine has developed rich ore at a new point. This mine has been a great producer, over $150,000 having actually been taken out by what is termed chloriding, that is, getting out the ore in the cheapest manner possible. The high cost of shipping ore and the high price of milling in times past, has forced the miner to make the most of the present without regard to the future working of the mine, and hence our richest mines have been badly butchered, so to speak, and do not present the appearance that they would if carefully opened up with a view to exposing the ore, instead of gouging it out wherever found. If the Cupel mine had been simply opened up by shafts and drifts and its rich ore left on the dump, it would be difficult to find a more promising mine. But while the mode in which it has been worked makes it look bad at the surface, yet it has, nevertheless, proved its value, and the very rich ore that is in sight at its deepest workings (115 ft) augura well for its future when properly worked.

TOMBSTONE.—*Epitaph*, July 20: The past week has been productive of much work and considerable encouragement in local mining matters. A gentleman who has been in the district from the beginning, gave it as his opinion that there was more actual work being done now than at any period in the history of the Tombstone district. The wonderful richness of the Randolph has given an impetus to prospecting on an extensive scale in the southwestern portion of the district. Scarcely a day but new developmeats of astonishing richness are made in the Randolph, and the result is that every claim owner in the vicinity has gone to work with a will to discover if the Randolph bonanzas extend to its neighbors. A strike of considerable magnitude has also been made in the Goodenough that promises, when opened up, to reveal an extensive body of ore. The other mines throughout the district are holding their own in good shape, and everything looks encouraging. The Tranquility is turning out some of the richest ore ever taken from a Tombstone mine, and the supply seems inexhaustible.

CANNOT SMELT.—Pinal *Drill*: We understand that the reason the Pinal Con. Co. cannot smelt their ore is that it does not carry sufficient iron, and the cost of obtaining the metal is too much. They are engaging a number of teams, and, it is said, expect to clear $40 a ton on the ore they ship to San Francisco.

COLORADO.

THE HIGHLAND CHIEF.—Leadville *Democrat*, July 20: The Highland Chief mine, on Breece hill, is at present worked on a lease, which was granted to Mr. George Steele and others about 60 days ago for a period of 9 months. The lessees are now working about 24 men and taking out from 30 to 40 tons of ore. The mineral is reported very low in grade, and a few pockets of the rich quality of mineral have been encountered.

IDAHO.

TWENTY-OUNCE ORE.—Wood River *Times*, July 19: A. B. Wood, who was superintendent of the famous Iron mine, of Leadville, last season, was in Hailey a few days ago, and, in conversation with one of our mining men, said that the time would soon come when 20-ounce ore would be worked at a profit, here as elsewhere. In Leadvill, Mr. Wood said, that grade of ore always pays a good profit, providing it carries a reasonable percentage of lead. The Iron mine, for instance, yielded vast quantities of ore which assays only 19 ounces in silver, yet it sold at the local smelters for $19 per ton. During four months, last summer, the Iron mine yielded 48,000 tons of that grade of ore.

"TUSCARORA" HAPPY.—W. R. Heaton, who is better known to old-timers here as "Tuscarora, the teamster," is at last happy. He came into the *Times* office to-day with a sack full of chunks of gray copper and bromide ore big as one's fist, which he said he had taken from a 20-ft vein which he owns on Main Lost river, about 8 miles above the old battle ground. He has two claims, each 1,500 ft long, with only one wall in sight, notwithstanding that a crosscut is already in 20 ft, and believes that he has a bonanza, or, as he expresses it, "something that'll give the wife and babies some shoes." "Tuscarora" came here with a team a couple of years ago, and earned a living by doing odd jobs of hauling. Last fall he lost his team, and he has had a hard row to hoe ever since. Fred C. Bradley is assaying his rock free of charge.

HAPPY GO LUCKY.—Wood River *News-Miner*, July 15: W. O. Arnold, one of our oldest and best prospectors took it into his head to wander in north of Boyle mountain, a couple of miles up the creek from Rooks' group of mines on Warm Spring creek, last week. The granite was at his back, and away up the mountain he could see an iron cropping, and he went for it, tapping the "solid formation" as he went. His pole pick at last knocked the persimmon, and, as the lime cap flew off bright galena shone forth. Before dark 1,000 lbs of 154-ounce ore was on the dump. Lee Baker is associated with Mr. Arnold, and now they have a shaft down 20 odd ft, with a 6-ft vein, well defined by one wall of lime, and the other is the galena body. Tapped in one place, it proved to be 18 inches thick. The mine is known as the Queen of the Mountains.

WEISER CITY ITEMS.—*Idaho Statesman*, July 20: The "mining boom" still runs high. Messrs Huntoon, Hill, Richardson & Hart have taken a bond of $10,000 on the New Era, owned by Messrs. Gunn, Gray & Haftman Bros. Prospectors are coming and going daily, and all seem well pleased. So mote it be.....Chas. Green, Esq., of Ogden, who owns the famous mine known as the Blanbick, was in town a few days since, and reports the sale of one of his mines to a Portland company. We did not learn the exact price.

MONTANA.

MORNING STAR.—*Inter-Mountain*, July 17: The customary amount of work is being done on the Morning Star. The west level from the 200-ft station has reached the line, and the ore now taken out is stoped from this level. On the dump are 200 tons of high-grade ore which will yield about 110 ounces in silver and $25 in gold; 75 or 80 tons of second-class ore, assaying 75 ounces in silver and $18 to $20 in gold; 300 or 900 tons of third-class ore going 40 ounces in silver and from $8 to $10 in gold. As heretofore stated in the *Inter-Mountain*, the mine has been bonded to a California company, and the bond expires August 1st. The first and second-class ore on the dump has been contracted at the Silver Bow mill, and hauling will commence on the 20th inst.

RAMSDELL'S PARROT.—The main shaft of Ramsdell's Parrot is down 300 ft, and a level is being run north to the line on the south vein. Heretofore some trouble was occasioned by the presence of water, but the mine is now effectually drained by the workings of the Anaconda on the east and the Shakespear Parrot on the west. The face of the level is now within 4 or 5 ft of the line, and the winze will be completed to-day, having attained a depth of 60 ft. From 10 to 25 tons per day are hoisted. Recent assays show 30 ounces in silver and from 20% to 35% in copper. The owners of the property have reason to feel elated at the quantity as well as the quality of the ore now being brought to the surface.

ON the Morning Star Fraction no work is at present being done. The shaft is 105 ft in depth. The ore taken from this shaft was worked at the Silver Bow mill, and netted $63 per ton.

WORK on the Sheridan, which was suspended on account of the immense volume of water, necessitating the purchase of additional machinery, will shortly be resumed.

NOTHING is at present being done on the Anselmo. A shaft has been sunk on the south vein to a depth of 9 ft, samples of which assay from 40 to 85 ounces in silver.

ON the Belle of Butte Superintendent Downs is sinking at present. The shaft is now 100 ft in depth, and it will be sunk to aa additional depth of 60 or 70 ft, at which point a crosscut will be run to the ledge. Stoping is being prosecuted on the 160-ft level, and about 20 tons of ore per day taken out.

WINZES are being sunk from the 130 to the 200-ft level on the La Plata. No ore is being hoisted but that taken from the winzes.

NO ore is at present being taken from the Original Butte. Sinking is progressing, and the shaft has attained a depth of 350 ft.

A VEIN of ore, much richer than any heretofore found, has been struck below the 700-ft level in the Alice. Butte mines will pay, and pay much better, as depth is attained.

THE PROSPECT LODE.—Butte *Miner*, July 19: Mr. Rice, of Butte, and Leyton, of Virginia City, are the owners of a fine ledge, known as the Prospect. A quantity of the ore has been taken to Glendale for reduction. Two pulp assays show $328 40 and $120.30, respectively. The lode is opened by 4 tunnels—all connected. An immense quantity of ore is lying on the dump that is worth $50 per ton. As soon as possible works will be erected. It is a silver lode, but carries a very large percentage of gold. The mine is situated near Dummer Dan's bar, Alder gulch.

NEW MEXICO.

LOS CERRILLOS.—Santa Fe *New Mexican*: A gentleman who came in from Los Cerrillos district yesterday said that he was at the Bonanza smelter Thursday and saw some of the bullion which was being turned out by the works. There were 5 bars, weighing 250 lbs. each. The machinery, he said, was perfect in every respect, but there was some fear that the water-jacket would be injured by the limited supply of water. The proprietor should, and doubtless will, look closely after this matter. It would be a serious injury to all parties should another delay occur. The miners want the smelter forthwith and immediately.

OREGON.

GENERAL NOTES.—Jacksonville *Times*, July 21: Cleaning up is progressing favorably at the Sterling mine..... The Squaw Lake Ditch Co. has shut down for the present, water being rather low.....Mr. Derickson will first put up his quartz mill in the vicinity of Williams creek, near the horsehead ledge.....Hanton & Berryman will next week commence prospecting a bar in the Applegate, opposite the Long place.....N. Wright, of Big Applegate, was in town yesterday, from whom we learned that the Applegate Gravel Co. has resumed piping.....J. T. Layton, of the Farris gulch mines, made a partial clean-up this week, obtaining about 100 ounces. He will take out much more.....W. Q. Brown & Co.'s nickel mine on Cow creek is prospecting well, and the proprietors propose spending a considerable sum of money in developing it.....The Oregon Cinnabar Co., whose works are located near Oakland, cleaned up 500 lbs. of quicksilver the other day, after a run of about three weeks.....J. D. Shearer, lately of Washington county, who purchased Caldwell's mining claim on Steamboat, is now engaged in getting ready for extensive operations.... J. J. Johnson, who owns the only good sized mining claim on Humbug creek, Applegate precinct, was in town this week. He is engaged in cleaning up, with favorable results.....Lance & Duffield, who are extensively engaged in mining operations on Foot's creek, are cleaning up with excellent results. They brought a large amount of gold dust to town Saturday last.....John Angell, of Portland, formerly of this place, is interested in the mines near Nesqually, W. T., that promise well. Some of the quartz assays several hundred dollars to the ton, and California capitalists are negotiating for its purchase.....We are informed that the copper mines situated in the vicinity of Waldo, Josephine county, have been bonded to a company of Boston capitalists for $50,000. An expert, in their interest, has examined the deposits and is favorably impressed with them.....Wm. Bybee left for Josephine county yesterday to look after his mining interests near Waldo. The Chinese who contracted to dig his company's ditch have thrown up the job, which will necessitate making another contract with other parties. Mr. Bybee expects that water will be turned in by the middle of November next.

UTAH.

SILVER REEF.—*Miner*, July 15: Sinking on the main incline of the 5th level in the Buckeye is going ahead at the rate of 20 ft a week. It is a large 2-compartment incline, equipped with pump and hoisting engine. The quantity of water encountered is but little more than was met with on the upper level. Drifting on the 5th level will be started in about a week. Prospecting being done is the extension of the 3d level north and the 4th running south. The vein shows well at both points. Work goes on as usual at the stopes, the usual quantity of ore being furnished the mill. The break in the dam is not yet entirely repaired, but the mill has been running regularly since the 4th. Repairs to the road, on washouts caused by the late rains, have been completed.

CHRISTY.—The largest development yet made for the year is in the west winze of the Tecumach, showing an unbroken line of ore on both sides of 80 ft in length; the ore in the face of the winze showing a width of 6 ft and assaying $100 per ton. This is a very important strike. The rest of the company's works are proceeding as usual. The ore product for July will be over $35,000; they are going west with the dip of the vein, and, with increased depth, shows increased value. To extract the ore from the winze, the company is now sinking a shaft on the Hartmann mine; hoisting works will be completed in about 60 days.

BARBER & WALKER.—A large body of fine ore is being uncovered in the north drift of the 500 level. The strike was made some time ago, and preparations are now being made to work it extensively. The works otherwise go on as usual.

The California Iron and Steel Company.

The mine started up Monday evening last. As it takes three or four days to get the furnace properly heated, they did not tap for iron until yesterday (Friday). Between 25,000 and 30,000 cords of wood have already been cut, an amount sufficient to keep the furnace supplied with charcoal for one year. Last year's experience decided the company that it was for their interests to manage the chopping of the wood and converting the same into coal. They have consequently purchased from Hayford, Perkins & Co. all their personal property about the kilns, consisting of wood wagons, coal wagons, horses, buildings, store, etc.; also their warehouse at Clipper Gap.

The coal wagons and teamsters now have their headquarters at Hotaling, a large and commodious corral, having been built for their accommodation. Mr. A. H. Smith, formerly Manager for Perkins & Co., has charge of this particular department.

The company has also lately purchased and are now running the store near the furnace. In fact, everything pertaining to the manufacture of pig-iron, in all its branches, will hereafter be under the exclusive management and control of the company. Telephonic communication between the office and the C. P. R. R. depot, at Clipper Gap, has been established, thus insuring the prompt and immediate carrying out of all orders from the San Francisco office.

Mr. R. Dundon, the former founder, continues in charge of the furnace. All iron remaining over from last year's run, consisting of Nos. 3 and 4 brands, has been removed to Clipper Gap, and everything is now in readiness for the new run. Careful precautions have been taken to prevent loss from fire on coal-bank or about the furnace.

A much larger supply of coal has been accumulated than was the case last year, preparatory to starting up. At the mine the prospect for a large and permanent supply of the best of ore is encouraging. Three shafts are now being worked, all in ore of the best quality. At the first shaft the ore is hoisted by means of an engine; at the other shafts whims are constructed. T. Smitheram, an old and experienced miner, has charge of the mine.

S. W. Cowles, late of Inyo county, was, about two months ago, unanimously chosen by the directors general superintendent. He has the work now well in hand. The delay in the starting up of the furnace has been largely due to the changes which the company had to make in the personnel of the officers. Orders have already been received from San Francisco foundries for several thousand tons of their Nos. 1 and 2 iron, now the most popular iron in the market.

The railroad company is now a regular consumer of their No. 3 iron, which is used exclusively for car-wheel purposes. It is found to be equal in every respect to the famous Salisbury iron in the East.

About 300 men are employed by the company, directly and indirectly, in Placer and Nevada counties.—*Placer Argus.*

Kinkead's New Mill.

This new device for grinding quartz was set in motion recently, for the inspection of all who desired to see it work. A great many availed themselves of the opportunity to examine a Reno invention which bids fair to make quartz mining a more profitable pursuit than it has hitherto been, because of great expense attending the erection of the simplest reduction works in use. It requires considerable money to put up a five-stamp mill and get it in running order, and this fact is the cause of hundreds of small veins owned by poor men lying idle. They are not large enough to induce capitalists to take hold of them; but, if the poor miners had means of reducing what rock they could take out themselves, a vast amount of gold and silver would get into circulation that is now lying useless in the earth. Kinkead seems to have struck it. The machine really works well, and grinds quartz to better than a 40 fineness as fast, if not faster than a 10-stamp battery, though it was not worked up to its full capacity at this trial, for the reason that the driving pulley was too small and the machinery at the foundry was all running at the same time.

It was making about 125 revolutions a minute, whereas its minimum speed when doing full work is calculated at 200 revolutions. It makes hardly more noise than an ordinary coffee mill, and is no more difficult to run. It will take rock about egg size and chew it up very fast. The apparatus is very compact and can be loaded in one wagon, complete for work. The thing is simplicity itself, there not being more than seven or eight pieces in the entire machine, and therefore is not liable to get out of order. When the grinding surface or shoes wear out, they can be replaced at a small cost, and at less proportional expense than for shoes and dies for common stamps, because the grinding surface can be worn away to paper thinness before they will have to be replaced. Little power is required to run it after it has once acquired necessary motion, and it may be allowed to run an indefinite time without injury, even if not fed with quartz, for if there is nothing for it to grind upon, it cannot wear itself away nor break anything, as is the case with stamps. It is believed, by those capable of judging, that the Kinkead mill is a thorough success.—*Reno Gazette.*

Tributing.

The Disadvantage of not Encouraging it on the Comstock.

The work done by tributers has become very extensive and important in Eureka district, in Austin, and in one or two other districts of Nevada. It may be said that at present these active miners working on their many pitches are doing the principal mining that is being done in the district. It is through their explorations that important discoveries are made, the benefits of which are not theirs, to any great extent, but reaped rather by the companies in whose ground they prospect at all points, working like beavers. Nearly all the work of prospecting in the Richmond and Eureka Con. is being carried forward now by the tributers. A great deal of valuable exploration might be done on the Comstock by tributers in ground which the mining companies will not explore—work that it is not improbable would result in strikes, doing the tributers good in yielding them a living, though not on an average day wages, but possibly showing up bonanzas never thought of before. On this subject the Reese River *Reveille* says:

In the old surface workings of the Comstock there are good spots, streaks and deposits of ore, of greater or lesser magnitude and value, that would pay well for working. They should have been worked long ago, and would have been, but for the niggardly, dog-in-the-manger policy pursued by the mine owners and managers. Parties who have tried to obtain leases of such idle ground, or even applied for permission to work certain old surface dumps on shares, have steadily been refused. And yet the stockholders of those very mines have been, and are still, regularly assessed instead of the upper level deposits being made to defray the cost of working the mine. No proper encouragement has been given to leasers or tributers on the Comstock. In one instance, at the Gold Hill end, an enterprising mill man succeeded in getting a sort of conditional lease of a worked-out portion of a mine, and by judicious management was succeeding well in getting remunerative ore to run his mill, but the mine management soon found that he was doing too well to suit them, so they managed to crowd him out and worked the ground themselves. The real "tributers" of the Comstock mines are the small stockholders, the outsiders. They are eternally paying tribute to the inside manipulators. For this are they stockholders.—*Eureka Sentinel.*

THE LOWER CLASSES.—Who are they? The toiling millions, the laboring man and woman, the farmer, the mechanic, the artisan, the inventor, the producer! Far from it. These are nature's nobility. No matter if they are high or low in station, rich or poor in pelf, conspicious or humble in position, they are surely upper circles in the order of natnre, whatever the facetious distinction of society, fashionable or unfashionable, decree. It is not low, it is the highest duty, privilege and pleasure for the great man and high-souled woman to earn what they possess, to work their own way through life, to be architects of their own fortunes. Some may rank the classes we have alluded to as only relatively low, and, in fact, the middling classes. We insist they are absolutely the very highest. If there be a class of human beings on earth who may be properly denominated low, it is that class who spend without earning, who consume without producing, who dissipate on the earnings of their fathers or relatives without having anything in and on themselves.

SILENT REMINDERS.—In approaching Austin from Reese River valley, the first prominent object on leaving the railroad depot, at the mouth of the canyon, is the cemetery—the graveyard. There lie buried many of the very earliest, as well as the latest, prospectors and residents, and "this city of the dead" is very fully peopled. It is a very suggestive sight to any one pointing their way into the canyon where Austin is, reminding them of the many possibilities that they may not come out as they go in, and that the only "dead thing" they have in prospect is what they see before them within that silent enclosure. The whole broad valley in that vicinity wears a desolate, solemn look, and even the tall, slim, spiral whirlwind dust-clouds, that continually go waltzing across and around the wide, level plain, singly or in pairs, or groups, look like disembodied, restless spirits, listlessly wandering in search of the lost hopes of the old prospector's soul, that would not die with his body.—*Austin Reveille.*

REWARDING BRAVERY.—A correspondent of the Virginia City *Enterprise*, in alluding to the presentation to the brave Van Dusen for his noble act in entering the Alta drift in search of the imprisoned miners, suggests that the presentation thereof might very properly be made the medium whereby a sufficient sum of money could be raised to erect over the last resting places of the two brave men, Bennett and Callahan, suitable granite slabs, which will stand as evidence that the large-hearted miners of the Comstock are not blind to the noble acts of the heroes who lost their lives in attempting to do what the living hero so nobly succeeded in doing.

THE CHANNEL TUNNEL.—London dates of July 21, state that leave has been given by the proper coast authority for a motion for an injunction to prevent further work upon the English Channel Tunnel.

One Million in Dividends.

On the 15th of July the 31st dividend was paid by the Silver King mine, in Arizona, completing the round sum of $1,000,000 since the organization of the company. Several dividends were paid previous to the incorpation, and the mine has paid from the very beginning. We do not know of another mine that has not required at least some money for its development. The Silver King has not demanded a dollar from its owners. The discoverers picked up nuggets, which were sold for dollars by the pound, for grub and tools, and they lived on it gaily, sumptuously and well, till they sold out for fortunes to Col. Barney, under whose wise and cautious management the mine has paid all expenses for development, paid him back the the purchase money, and now $1,000,000 dividend to the stockholders. The Silver King is a perfect Niagara of money mines. It pours its silver stream into the currents of business, from apparently an endless source. It requires no aid, except the handling of the treasures, as they glisten and invite themselves out of their native caves and caverns. But a few years have passed since all around was but one slumbering wilderness. The Silver King arose out of his sleep, and shook his garments full of riches to the astonished gaze of all. To-day 2,000 people thrive around the mine and mill in growing wealth and happy homes. The boundless native wealth and constant cautious care of all its interests has made the Silver King a true colossus. Good faith to all has marked the onward path of this concern. A faithful adherence to the original plan and promises to stockholders, and all else connected with it, has never been deviated from. The King is solid, in every sense. The ample newly completed arrangements at the mine for work, with every facility for mining on the most extensive scale, will soon be followed by reduction works and machinery at Pinal, and in addition to the present ones, others, which will reduce the ore into bullion on a scale as grand, ample and perfect as skill, capital and ingenuity can produce.—*Pinal Drill.*

EUREKA TUNNEL.—A *Sentinel* reporter visited the Eureka Tunnel yesterday. He found that work is being pushed actively at various points, 20 men being employed in the mine, three of whom are tributers. Since our last report the main tunnel has been driven 60 ft. farther in, making the entire length 2,000 ft. In reaching the present face of the tunnel, a stratum of about eight feet of mineralized sand, similar to that found in the vicinity of ore bodies on Ruby Hill, was passed through. On the east drift from the bottom of the winze, in about 60 ft., a body of yellow carbonate ore assaying $60, and two feet wide, was struck several days ago, upon which an upraise has been made some seven or eight feet, the ore body continuing. At the end of north drift No. 1 a seam of red carbonates, four or five inches wide, has been struck, which assays $40. This is being followed in the hope that it will open out into a body of pay ore. General Connor informs our reporter that stockholders in the East are sending in their assessments. He received a check from an Eastern shareholder yesterday for $250 to pay his assessments, and the Tunnel stockholders in Salt Lake have ordered their brokers in San Francisco to pay their assessments.—*Eureka Sentinel.*

AMERICAN WEALTH.—Several articles have recently appeared in the English papers on the growing wealth of the United States. The *Times* says: "The wonderful wealth-producing power of the United States defies and sets at naught the grave drawbacks of a mischievous protective tariff, and has already obliterated almost wholly the traces of the greatest of modern civil wars. What is especially remarkable in the present development of American energy and success is its wide and equable distribution over the shores of the Atlantic and Pacific, along the chain of the great lakes, the valley of the Mississippi, the coasts of the Gulf of Mexico, where the creation of wealth and increase of population are signally exhibited." Another paper says: "With high wages Americans have been able to compete with us in the markets of the world. Should wages considerably decline, the United States will become a formidable rival not only of England, but of Europe."

BODIE CON. RICH ORE.—During the week ending July 15th, the mill crushed 110,265 tons of ore representing 6½ days run, the mill having been stopped on the 4th instant, the 24 hours cessation being equally divided between the weeks ending 8th and 15th instant. There were 150,820 tons of ore hauled to the mill. The average assay value of the ordinary ore was $65.11 per ton; that of the sacked ore $702.84 per ton. The average value of the whole pulp was $127.10 per ton. The average assay value of the tailings was $16.94 per ton. The shipment was $10,093.54.

MILL BOUGHT.—The Star Co., through its superintendent, Mr. Foulke, has purchased the Dayton mill near Hamilton, for $3,000 and last year's taxes, which amount to about $500 more. The machinery of the Dayton is almost as good as new, and no doubt was sold at a low figure. The machinery will be removed as soon as possible. The boilers will be utilized at the Star mine, and the balance will be used at the mill as occasion requires.—*White Pine News.*

The Georgetown Divide.

Could the amount of gold taken out on Georgetown divide within the past four months be made known, the fact would create quite a boom. It is estimated that fully $200,000 have been extracted during this period. We believe this amount can be easily accounted for, let alone many thousands that have been quietly taken out of the county and sold. We hear from a very good source that two men recently took out some $8,000 from a pocket in quartz in the vicinity of Sand mountain. The quartz and seam mines of this divide have not yet reached the ultimatum of their development. We express this opinion in contradistinction to the opinions of some of our people.

Our extensive mines of $4 to $8 rock will, ere many years, be worked with profit. In traveling over the mining districts it is plain to see many of the mistakes made in years past of erecting expensive mills on small chutes of rich ore in good-looking ledges. In nearly every instance the owners would have profited by selecting the ore and hired it hauled to a neighboring mill; but no, they "have a big thing" and must put up a mill. Often a stock company is organized upon the strength of the "glittering ore," but, of late years, California capitalists don't invest very heavily in "specimen" ledges. Such mines find better sale among Eastern men. California capitalists, as well as some experienced Eastern and English mining men, are looking more after even and extensive low-grade ores than limited rich pay chutes, outside of which the lode is comparatively barren.

Pocket or specimen mines can be advantageously worked by the industrious miner, where, in most instances, the capitalist would lose money in taking hold of them, as he would be likely to invest more on the mine than he would take out. The poor miner cannot work his low-grade ore with profit, but capital and good management can.

Better place a five-stamp mill on a favorably located lode 5, 10 or more ft. in width of regular paying $4 rock, and, by economy and good management, build up your business by enlarging your mill and increasing your profits, than to place a 10-stamp mill upon a limited chute of high-grade rock. These mistakes and speculating ventures are damaging to the country—they give the locality "a black eye."—*Georgetown Gazette.*

PROSPECTING EXPEDITION.—Yesterday morning a party of seven men mounted on mules and driving well laden burros, left this city and bent their steps in the direction of balmy Montezuma. The party were under the lead and management of John O'Connell, a prospector of much experience in Australia, California, Nevada, Utah and Colorado. It is understood that the party was "grub staked" by some well-known business men of this city, and it is their intention to make the canyons and slopes of the Sierra Madres their base of operations. The mountains will be prospected thoroughly, and natives put to work to develop any claims of promise that may be discovered. The party are supplied with provisions for six months, plenty of arms and ammunition, blasting powder, and everything necessary to the business they propose to follow. They intend to penetrate as far as the head waters of the Rio Yaqui.—*Tombstone Epitaph.*

STUPENDOUS ENTERPRISES.—Great enterprises are springing up all over the world. Besides the Mt. Cenis tunnel, the Alps are being pierced by a still greater bore under Mt. St. Gothard. The Suez canal finds a counterpart in the projected inter-oceanic canal across the Isthmus of Panama. The problem of a tunnel beneath the English channel, which has long been mooted, begins to assume tangible shape, and now it is seriously proposed to unite Europe and Africa by a tunnel under the Straits of Gibraltar. As now projected, the tunnel is to be constructed in a straight line, and he extended between Tarifa and Algeziras on the Spanish coast, toward Ceuta and Tangier, on the coast of Morocco. The submarine part will be nine English miles in length.

OUR ENTIRE GOLD PRODUCT.—It has been estimated that $1,200,000,000 of gold and silver have been mined in the States west of Missouri within the last thirty years, and that in spite of the recklessness and extravagance which characterized the two decades in California from 1849 to 1869, a net profit of $30,000,000 per annum was realized. Since 1850 the money invested and the labor expended in mining for precious metals is estimated at $710,000,000. What may fairly be called the mining territory of the United States embraces and area of 1,190,000 square miles, with a population of 1,500,000. Yet this great industry has just reached the point where systematic and legitimate management is possible.

MR. O. J. SALISBURY, says the Salt Lake *Tribune*, has returned from the Bertrand, at Eureka, leaving R. D. Clark in charge. Everything was apparently working well. The ore gave up in the leaching vats 90% of its value. The rolls are equal to crushing 60 or 70 tons per day. It requires from 8 to 12 hours to chloridize, and the vats can be charged, leached with hot water and the solution, and discharged in 24 hours. There is nothing to hinder the mill from earning plenty of money

The Engineer.

Bold Way to Cross the English Channel.

A Paris correspondent of the London *Daily News* says that an engineer is about to visit England with a new and bold plan for crossing the British channel by a bridge to be located about eight or ten miles below the present opening for the tunnel, starting from Folkstone and crossing to Cape Grisner. This bridge will be 23 miles in length, and will exhibit many varieties of style. Some parts will be tubular, some iron framework open to the sky, and some again viaducts of masonry. The plan will be accompanied by a picture of the bridge as it will appear after construction. Beneath the bridge will be seen (in the picture) ships in full sail—"Great Admirals" bearing the Queen's flag gliding proudly under the central arches, and tiny fishing-boats making their way with equal ease through the lower doorway in the shallows. The arches will rest sometimes on the sea bottom, sometimes on an artificial foundation of loose stone, or on a couple of submarine islands which nature has most obligingly placed in this very spot as a hint of her views on the question of communication between England and France. M. Verard de Sainte-Anne, says the correspondent, is the apostle of this new idea of inter-communication, and his scheme is the alternative to the tunnel. The tunnel is altogether out of the question. It would be very costly in any case, and no one knows what soft places in the chalk the boring might not reveal. Then who could breathe down there? Unbroken railway communication with England, he says, alone stands between France and commercial ruin. Bismarck, far more dangerous in peace than even in war, has been quietly plotting a sort of commercial Sedan to block France off forever from all share of the English trade. England, with her immense commerce, binds the Eastern and Western hemisphere as a main link. France continues the chain, but Bismarck is determined to cut her out of it for the benefit of Berlin.

A New Propeller.—A new and improved propeller wheel has been patented by Joseph Belduke of this city. The blades are constructed and placed in a manner entirely different from the position of the old-fashioned dual flake, at present generally in use. The blades of the Belduke propeller have a greater curvilinear form than the ordinary propellers, and can, therefore, displace a greater amount of water upon each turn of the wheel. Unlike the blades of the propeller previously in use, they are not attached to the revolving shaft, so as to form one solid mass of iron; but each blade forms a separate part of the machinery. In case of an accident, any of the blades can be removed from the drum without any difficulty. This can be done even while the vessel is in the water. A trial test of the new apparatus was made about three months ago on the small steamer *Elizabeth Mary*, which is owned by the Dry Dock Company, and which runs from the foot of Second street to Mission Rock. The ordinary screw was first used, and by actual count it was ascertained the wheel made 140 revolutions per minute. Afterwards the new wheel was placed in position at the aft of the same vessel, and averaged not more than 120 per minute. Even with this decrease of revolutions, the rate of speed was increased over 10%.

Fast Time.—A special of the St. Louis *Globe-Democrat* has been interviewing Mr. Lovell, Superintendent of the railway mail service in regard to a proposed reduction of time between New York and San Francisco. Said Lovell: "It would, of course, be necessary to confer with the companies and negotiate with them, as the increased speed will call for cutting off cars on these particular trains, as well as add to the expense of running them." "What do you think the future has in store for time between New York and San Francisco?" "I expect to see mails carried from city to city in three days and a half. It now takes about seven. Think what a difference this would make with business. If the Bank of California should send a draft for $1,000,000 to New York, they could have the use of the money three days longer than they do now. Then a business man sending cash from one place to the other, to meet business obligations, would get some benefit. In simple matters of business, the amount saved would be beyond belief."

Engines to Run by Sun Light.—William Calvert has patented a reflector consisting of 100 or more mirrors, by which he concentrates the heat of the sun in sufficient force to generate steam in large quantities. He claims it will revolutionize the manufacturing business where fuel is scarce and sunshine plenty. It will be recollected that Ericson recently promised to prove the practicability of so concentrating the sun's rays as to drive a mill steadily. He announced that he had perfected a means of collecting the sun's rays and reserving them for use in cloudy weather. His silence indicates that he did not succeed; but it is not to be assumed that a first failure condemns the principle. We find that two French savants pronounce the principle correct; saying that science will finally triumph over all difficulties; and they anticipate a general derivation of all mechanical power from sun-heat.

Useful Information.

Photography at the Bottom of the Sea.—Dr. Neumayer has recently exhibited before the Berlin Geographical Society a photographic apparatus designed for the determination of the temperature of the currents at great depths in the ocean. The invention is composed of a copper box, hermetically sealed and furnished with an exterior appendex, made like a rudder. In the interior is a mercury thermometer and a compass, each enclosed in a glass receptacle, in which are admitted traces of nitrogen gas. A small electric battery completes the apparatus. When the latter is allowed to descend attached to a sounding line, the action of the current on its rudder causes it to assume a parallel direction, thus indicating the set of the flow by the relative position of compass, needle and rudder. The thermometer, of course, shows the surrounding temperature. In order to fix these indications, a piece of photographic paper is suitably disposed near the glass cases containing the instruments. Then, at the proper time, a current of electricity is established through the gas in the receptacles, causing an intense violent light, capable of acting chemically upon the paper for a sufficient length of time to allow of the photography thereon of the shadows of the compass needle and of the mercury column. Within three minutes, it is said, the operation is complete, when the apparatus is hoisted and the paper removed.

Electric Lights in Sea Fishing.—A French paper reports a trial by government permission of an electric lure for sea fish. It consists of an electric light in a glass globe with a device for sinking it to the desired depth. As soon as the light is turned on the sea in its vicinity is illuminated brilliantly, and the fish, over whom light is well known to exercise an irresistible influence at night, come eagerly, and sometimes in large schools, within the rays. They may be seen from above disporting themselves in the unaccustomed brightness, and little dreaming of the sinister purpose with which the little fete is organized for them. It is then that other fishing boats, armed with nets, come up and set to work at the unconscious victims, which they surround as well as they can without interfering with the apparatus connected with the lighted globe. It may be supposed that this device is calculated to operate with much deadly effect whenever it is used; and there seems to be much doubt whether it will ever be allowed as a recognized kind of fishing within territorial waters. Indeed, the license granted by the government is said to be merely provisional, and for the purpose of testing the new machine.

Why a Lamp Wick Does not Burn.—If we take a piece of lamp wicking and place it in the flame of a lamp, it is immediately consumed; but the same kind of wicking, placed in a lamp and lighted at the top, lasts the whole evening, and, if the lamp is supplied with alcohol, the wick is not even charred. The cause of this was a perfect mystery until a hundred years ago, when Dr. Black, of Glasgow, discovered the principle of latent heat. As the oil or the alcohol comes near the flame, it is evaporated, and by this change in its form, a large quantity of heat is destroyed, or rather is latent, so that it does not manifest itself in any way. It requires a great quantity of heat to change a liquid into vapor, so that evaporation always cools surrounding objects. The wick is cooled by the evaporation of the oil or alcohol below the temperature at which it will burn. Dr. Black's discovery suggested to Watt his great improvement in the steam engine—condensing the steam in a separate vessel from the cylinder. Watt attended Dr. Black's lecture.

To Collect the Odors of Flowers—Roses, and all flowers containing perfumed oils, may be made to yield their aromatic qualities by steeping the petals or flower leaves in a saucer, or in a flat dish of water, and setting it in the sun. The petals should be entirely covered with the water, which should be soft, or rain water. A sufficient quantity should be allowed for evaporation, and the vessel should be left undisturbed a few days. At the end of this time a film will be found floating on the top. This is the essential oil of the flower, and every particle of it is impregnated with the odor peculiar to the flower. It should be taken up carefully and put in tiny vials, which should be allowed to remain open till all watery particles are evaporated. A very small portion of this will perfume glove boxes, apparel, etc., and will last a long time.

Painting Zinc.—A difficulty is often experienced in causing oil-colors to adhere to sheet zinc. Boettger recommends the employment of a mordant, so to speak, of the following composition: One quart of chloride of copper, one of nitrate of copper, and one of sal-ammoniac, are to be dissolved in 64 parts of water, to which solution is to be added one part of commercial hydrochloric acid. The sheets of zinc are to be brushed over with this liquid, which gives them a deep black color. In the course of from 12 to 24 hours they become dry, and to their now dirty-gray surface a coat of any oil-color will firmly adhere. Some sheets of zinc, prepared in this way, and afterwards painted, have been found to entirely withstand all the atmospheric changes of winter and summer.

To Make Artificial Shagreen.—The substance known as shagreen, used in covering instrument cases, telescopes, sword hilts, etc., has generally been supposed to be derived from the skin of sharks and rays. We are now informed that an imitation is made in Russia, which can scarcely be distinguished from the original, and that this is prepared from the skins of horses, soaked in water and scraped, and while the skin is still soft, small seeds, such as mustard or chenopodium, are imbedded in it, and the surface afterwards shaved down. By dyeing with green, produced by the action of sal-ammoniac, or copper filings, and drying, the imitation in question is satisfactorily accomplished.

To Build a Chimney that Will Not Smoke.—The chief point is to make the throat not less than 4 inches broad and 12 long; then the chimney should be abruptly enlarged so as to double the size, and so continued for one foot or more; then it may be gradually tapered off, as desired. But the inside of the chimney, throughout its whole length to the top, should be plastered very smooth with good mortar, which will harden with age. The area of a chimney should be at least half a square foot, and no flues less than 60 square inches. The best shape for a chimney is circular, or many-sided, as giving less friction (brick is the best material, as it is a non-conductor), and the higher above the roof the better.

"Spinning" Metals.—The old and familiar way of manufacturing vessels of copper and zinc by hammer, rivets and soldering-iron, is fast giving place to a new method; that of spinning. A circular piece of sheet copper of ordinary thickness is placed on the lathe, and in a twinkling is spun into the shape of a kettle, without a break or weakening of a single fiber of the material. There are no jointures, the kettle being formed entirely from the original copper sheet. The kettle bracets, sides, and a strengthening portion for the spout are formed of one piece of sheet copper metal and double-seamed to the pit, so that the seams are under the side of the kettle and form a strengthening rib upon which it rests when in the stove

Good Health.

Something New in Consumption.—The Reno *Journal* tells of the case of A. H. Barnes, of that city, who fights off consumption by wearing a silver tube, which passes between the ribs into the lungs. In 1849, Mr. Barnes, then living in Sycamore, DeKalb county, Illinois, was declared an incurable consumptive. The lung was tapped and he recovered. In 1863 he was again taken down by the disease, when he once more resorted to the tube, and has worn it constantly ever since. There is a daily discharge of matter. Mr. Barnes is a man of very regular and temperate habits, does not use tobacco in any form, nor stimulants of any kind, hardly ever uses any medicine, excepting sometimes a little iron for the blood; is always feeling well when the hole in his side is open, sometimes feeling a heaviness there, but has got used to that. This case is certainly worthy the special attention of medical men. It seemed to give a man a new lease of life, even when apparently as good as dead. When Mr. Barnes conceived the idea of tapping his lung, all the physicians but one counted it as a thing that would prove fatal. However, he persuaded one to perform the operation. In 1863, Mr. Barnes was in Honey Lake valley, and was on the brink of the grave. Now, again, the resident physicians were opposed to the idea of an incision, and after repeated appeals for an operation, which was refused, Mr. Barnes borrowed a lance and cut open his side himself. He then inserted a catheter and drawing off nearly a quart of matter, immediate relief was found. The cough and expectoration stopped almost instantly, and Mr. Barnes was soon upon his feet again. Thus he has prolonged his life for over 30 years.

Loss of Memory by the Aged.—Mr. Winthrop has his mental faculties in full vigor. His Yorktown oration will be remembered as a proof of this. We have had two notable examples of the decay of memory in great men in the case of Mr. Adams and Mr. Emerson. There is a complete blank in Mr. Adams' mind often as regards the more immediate past, which made him an easy prey to the scoundrel who has just had five years' sentence in the State prison for swindling him. Mr. Emerson's lack of memory took another form. He could not remember the names, either of persons or things, when he undertook to converse; but this did not involve an incapacity for ordinary reasoning. There is a pleasant story showing that something of the element of humor remained with him during his time of difficulty in this respect. He was going out one day, and his daughter saw him searching for something to take with him. He could not name it. She mentioned two or three articles, to which he returned a negative. At length he turned to her with a twinkle in his eye, and said, "It is the thing that people take away." She at once brought him his umbrella, and all was right. Mr. Holmes, who is two years past 70, was asked the other day if he had this trouble about remembering. He replied, not at all, except possibly in the case of persons. This statement may readily be credited when it is remembered that he is active as a lecturer before the Massachusetts Medical College, and gives no less than 70 lectures in a season to his students.

The Nostrum Fallacy.

When a child complains of headache, lassitude, or want of appetite, the nurse concludes that he must "take something." If the complexion of a young lady grows every day paler and pastier, her mother will insist that she must "get something" to purify her blood. If the baby squeals day and night, a doctor is sent for, and is expected to "prescribe something." What that something should be, the parents would be unable to define, but they have a vague idea that it should come from the drug-store, and that it cannot be good for much unless it is bitter or nauseous. Traced to its principles their theory would be about this: "Sickness and depravity are the normal conditions of our nature; salvation can come only through abnormal agencies; and a remedy, in order to be effective, should be as anti-natural as possible."

Perfectly logical, from a Scriptural point of view. But nature still persists in following her own laws. Her physiological laws she announces by means of the instincts which man shares with the humblest of his fellow creatures, and health is her free gift to all who trust themselves to the guidance of those instincts. Health is not lost by accident, nor can it be repurchased at the drug-store. It is lost by physiological sins, and can be regained only by sinning no more. Disease is nature's protest against a gross violation of her laws. Suppressing the symptoms of a disease with drugs means to silence that protest instead of removing the cause. We might as well try to extinguish a fire by silencing the fire bells; the alarm will soon be sounded from another quarter, though the first bells may not ring again till the belfry breaks down in a general conflagration.

The laws of health, though liberal enough to be apparently plastic, are in reality as inexorable as time and gravitation. We cannot bully nature, we cannot defy her resentment by a fresh provocation. Drugs may change the form of the disease—*i. e.*, modify the terms of the protest—but the law cannot be baffled by complicating the offense; before the drugged patient can recover, he has to expiate a double sin—the medicine and the original cause of the disease. But shall parents look on and let a sick child ask in vain for help? By no means. Something is certainly wrong, and has to be righted. The disease itself is a cry for help. But not for drugs. Instead of "*taking* something," something ought to be *done*, and oftener something habitually done ought to be *omitted*. If the baby's stomach has been tormented with 10 nursings a day, omit six of them; omit tea and coffee from the young lady's *menu;* stop the dyspeptic's meat rations, and the youngster's grammar lessons after dinner. But open the bedroom windows, open the door and let your children take a romp in the garden, or on the street, even on a snow-covered street. Let them spend their Sundays with an uncle who has a good orchard; or, send for a barrel of apples. Send for the carpenter, and let him turn the nursery or the wood-shed into a gymnasium. In case you have nothing but your bedroom and kitchen, there will still be room for a grapple-swing; the Boston Hygienic Institute has patented a kind that can be fastened without visible damage to the ceiling.

If the baby won't stop crying, something ought to be done about it. Yes, and as soon as possible; remove the straight-jacket apparatus, swaddling-clothes, petticoat, and all; spread a couple of rugs in a comfortable corner, and give the poor little martyr a chance to move his cramped limbs; let him roll, tumble and kick to his heart's content, and complete his happiness by throwing the paregoric bottle out of the window.—*Dr. Felix L. Oswald, in Popular Science Monthly.*

The Perfume of Metals.—Recent experiments of M. H. Pellat, communicated to the French Academy of Sciences, tend to show that when two metal surfaces are brought very close together (say within a few tenths of a millimeter) a slight change takes place in the properties of the surfaces. The change requires a few minutes for its completion, and gradually disappears again when the disturbing metal is withdrawn. The phenomenon is detected by measuring the differences of potential between the electric strata covering the surfaces of the two metals in contact. The strongest effect of the kind is produced by lead and iron placed near another metal. Copper, gold and platinum give a distinct effect, but zinc does not appear to possess the power. It would seem from these experiments as if metal gave off at common temperatures a volatile substance, which, when deposited on the surface of objects, modifies their chemical nature. The opinion of Mr. Pellat is supported in his view by what we know of the smell of metals, a subject investigated by the late Professor Rankine.

Something About Summer Dinners.—Summer dinners should never have anything on the table when the guests sit down but the flowers and the desert, the ice pitcher or carafes and bowls of ice, the glass, China and silver, and these should all be simple and not profuse. It is better for almost everybody to eat a hot dinner, even in hot weather. An egg salad is an excellent cold dish for lunch or a picnic dinner. Boil your eggs hard, slice them, cover with a mayonnaise dressing, and put a few lettuce leaves about the plate. Cold custards, Charlotte Russe and cream stiffened with gelatine and delicately flavored are very nice at a summer dinner, with home-made cake.

SAN FRANCISCO:

Saturday Morning, July 29, 1882

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Mine Ventilation, The Denver Mining Exposition, 65. Mining Share Market; An Old Mine, 68 Passing Events; Miners' Convention; Chlorination, 72.

ILLUSTRATIONS.—Air Current from Falling Water, 65. The Grebe and its Floating Nests, 73.

MISCELLANEOUS.—Forest Trees of California; Prospectors that Hinder; Go Slow, 66. The California Iron and Steel Company; Kinkead's New Mill; Tributing; One Million in Dividend; The Georgetown Divide, 70.

MECHANICAL PROGRESS.—True Value of Mechanical Skill; A New Locomotive; Wood Carving; Tempering; Work; Metal Alloys; A New Alloy, 67.

SCIENTIFIC PROGRESS.—The Rate at Which Thought Travels; Kabath's Accumulators; The Effects of Terror; Astronomical Telescope Work; A Discovery of a Grand Hall, near the Pantheon, at Rome; Modern Mastodons, 67.

THE ENGINEER.—Bold Way to Cross the English Channel; A New Propellor; Fast Time; Engines to run by Sun Light, 71.

USEFUL INFORMATION.—Photography at the Bottom of the Sea; Electric Lights in Sea Fishing; Why a Lamp Wick Does not Burn; To Collect the Odor of Flowers; Painting Zinc; To Make Artificial Shagreen; To Build a Chimney that Will not Smoke; "Spinning" Metals, 71.

GOOD HEALTH.—Something New in Consumption; Loss of Memory by the Aged; The Nostrum Fallacy; The Perfume of Metals; Something about Summer Dinners, 71.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends, 68.

MINING SUMMARY from the various counties of California, Nevada, Montana, Arizona, Idaho, Utah, Oregon, Colorado and New Mexico, 68-69.

Business Announcements.

Machinery and Shafting Lubricants, Edward B. Read, S. F.
Delinquent Sale—Seaton G. M. Co.
Dividend Notice—Bulwer Con. M Co.

Passing Events.

The principal event of the week from a miner's point of view, is the Debrie Convention, which we have pretty fully reported in another column. The resolutions and the plan of incorporation of the association are each worthy of careful reading by all interested in the question.

Aside from this, events in connection with mining matters, are somewhat scarce.

The Denver Exposition opens next week, and efforts are being made now to have California properly represented by a large collection.

SMALL MINES.—A good deal of mining is being done down about Silver City by private parties. There are many small veins in that section that will pay from the surface. No very big yield is looked for from these ledges, but when a man has got out 5, 10 or 20 tons of ore it does not take him long to get coin for it. At and near the surface the pay is nearly all gold. Occasionally some rich pockets are found.—*Virginia Enterprise.*

ALMOST READY TO START.—The busy work of preparation in erecting the new smelter at Soda Springs is drawing to a close. It was learned a few days ago that a start would be made on Friday or early next week. William Stansfield has taken the contract to haul the ore, and was to have commenced on Tuesday last. Before long the vicinity of the smelter will be a busy scene, and one more commendable enterprise added to the increasing list in Esmeralda county.—*Candelaria True Fissure.*

E. E. CURREN was in Bakersfield lately and created excitement about a mining discovery near Pleasant Springs, on Breckenbridge mountain, between Walker's Basin and Havilah. He described his find to be a vein of gold-bearing quartz. Its average thickness is from four to eight feet. Assays from the claim he located upon it ranged from $2 to $200 per ton.

Miners' Convention.

On Saturday last the hydraulic miners of the Yuba river water sheds met in convention, at Nevada City, to make arrangements for the building of a dam to impound the cobbles, heavier debris, etc., from the mines. The resolutions adopted at the meeting we give in another column. Hon. Niles Searls was selected as chairman. On taking the chair Judge Searls set forth the advantages which have resulted from the mining industry in peopling our State and building happy homes, and said that that industry is now imperiled. He hoped something might be done to avert the threatening danger. The following gentlemen were selected as Vice-Presidents: J. S. McBride, C. W. Cross, Henry Everett, John Morton, S. Mobley, William Hearne, C. L. Brown and H. W. Wallis.

The following were chosen as Secretaries: E. M. Sunderland, J. D. White, David Morgan and E. J. Le Breton.

Hamilton Smith, Jr., moved that the chair appoint a committee of five to draft resolutions expressive of the sense of the convention. The chair appointed as such committee Messrs. J. C. Coleman, H. Smith, Jr., R. C. Walrath, J. E. Brown and H. W. Wallis.

The representatives attending the meeting included most of the leading hydraulic mining superintendents and those whose property interests will be largely affected by the outcome of this most important question.

The Secretary then read articles providing for the organization of the miners dumping their debris into the Yuba river and others, for the purpose of uniting in building one or more dams to prevent the flow of debris in said rivers.

The articles of incorporation of the Yuba River Dam Association recite that it is deemed best to put into execution the preventive and protective course indicated in Judge Temple's decision, by building dams in the valley or canyon of the Yuba river; but that the miners do not thereby waive any legal rights or claims in the premises, but assert a legal right to discharge water and tailings from their mines into the Yuba or any of its tributaries. Therefore, for the purposes of mining and selling water, and to avoid litigation, the signers of the articles form the "Yuba River Dam Association."

1. To construct the dams referred to.

2. To aid in the construction of any dams and reservoirs the State or national government may undertake to prevent debris now in the river bed, and to be discharged by future mining operations, from passing below the dams contemplated.

3. To acquire lands necessary for the dam sites, etc.

4. To acquire all water rights and water privileges that may or can be located, purchased or appropriated on the Yuba or any of its tributaries, and to construct dams and canals for the diversion and use of the same.

5. To acquire lands in Nevada, Yuba and Sutter on which to discharge and deposit, if necessary, the detritus and muddy water, and to improve the lands by irrigation and cultivation.

6. To take contracts from the government, State or national, for constructing dams or reservoirs.

To these ends the signers form the Association, and are bound by these terms:

1. The association to exist five years.

2. To have a board of managers members of the association and miners, or an officer of a mining company. Ditch and canal companies and owners may become members. The managers to have power to do all things necessary to the accomplishment of the purposes of the association, and to borrow, not exceeding $20,000, in the name of the association and to give its note therefor. A majority of the managers to constitute a business quorum.

3. The managers to receive no compensation, except actual traveling expenses when on business of the association, and $5 to each member for each meeting.

4. There is to be an engineer and a superintendent to the association, but the two offices may be merged into one.

5. The officers to be a President, Vice-President and Treasurer, chosen by the board; the first two to be members of the board.

6. Egbert Judson, David Cahn, L. L. Robinson, J. H. Bolles, Thomas Price, Alvinza Hayward, suggested as six of the nine managers for the first year.

7. The board to name an Executive Committee of three and determine its powers, and may appoint an Auditing Committee.

8. Election of managers to be in July of each year. Every member to have one vote for each $5,000 of valuation of his property as represented by him, and one vote for each fraction of $5,000. The valuation to be based on State and county assessment of the preceding year.

9. Managers may levy assessments, based on assessed valuation of members' property, and each member authorizes the levy of the same to the extent hereinafter named, assessments to be paid in 30 days, and if not, may be sued for.

10. No member to be interested in contract or furnishing work for the association unless first fully made known to the managers. Work to be let to lowest bidder.

11. Where money is needed before the regular assessments can be levied such members as contribute to an advance are to be allowed 8 per cent. interest.

12. On dissolution the members to share in the property according to the amount of assessments contributed.

13. The amount of money to be raised by assessment in no event to exceed $500,000. Nor shall over $300,000 be raised without consent of at least two-thirds of all the members of the association, given at a meeting for the purpose.

14. No member to be liable for more than his proportion of the debts, as measured by the number of votes to which he is entitled.

15. Provides for amendment of the rule.

16. As it may become necessary to organize the association anew and perpetuate it, and to procure proper legislation to enforce payment of money by Yuba miners and ditch owners who will not voluntarily contribute to the resources of the association for the construction of restraining works, the managers are to take such steps as wisdom dictates to secure the passage of proper laws, and to reorganize the association on such a basis as experience shall indicate as best, to the carrying out of the objects of the association.

Chlorination.

[Written for the PRESS by P. C. DU BOIS.]

The Process for Working Sulphurets.

It has been found by experience, after many exhaustive attempts in various parts of the world to work them otherwise, that the easiest, cleanest and most complete method of getting the gold out of "sulphurets," as pyrites and galena in quartz is commonly called, is by using chlorine and moisture.

So true is this, and so universally known is it, that I take it for granted no one at all conversant with metallurgical processes will for a moment gainsay it. Chlorine seems to be the one element known to us that will at once dissolve and disassociate quickly and cheaply fine particles of gold out of their mixture with oxides of the metals commonly found in sulphurets, namely: iron, lead, copper, antimony, zinc and aluminum.

To utilize this property of chlorine was the aim of Plattner, the grand success of Deetkin, and the final improvement of Mears.

Plattner first successfully applied chlorine to extract gold from arsenide waste in Reichenstein, Silesia, in 1851.

His discovery was speedily sought to be modified or improved by Calvert, who used "nascent chlorine;" Kiss, with another modification; Patera, using a solution of salt saturated with chlorine; Rosner, who roasted with salt, and used a hot solution of salt for dissolving; and several other men, other modifications.

As all these departed from the simple, direct application of the gas to the roasted and moistened pulp-mass, they seem to have departed from a practical success, and but little is now heard of them.

Deetkins' great success was in so coating wooden vessels that they resisted the dissolving action of chlorine. He thus rendered it feasible to establish complete plants for carrying out the reactions at a moderate outlay of money, by furnishing cheap containers and conduits, dispensing with the porcelain and glass jars, vats and tubes of the German works.

Mears' improvement consists chiefly in condensing the gas and forcing it into the pulp while it is in a state of great agitation or commotion, whereby the time required to carry out the phenomenon of dissolving gold is reduced from one twenty-fourth or one forty-eighth.

The Plattner process, as improved by Deetkin, described in general terms, is performed as follows:

(1.) The auriferous concentrates having been perfectly oxidized, are moistened with water, and put lightly, by means of a sieve, into a wooden vat, coated with tar and rosin, and having a perforated false bottom upon which a filter is made, for which there are numerous ways. When filled, a close-fitting cover is placed on top, and (2) chlorine gas, produced by decomposing salt, and per oxide of manganese with sulphuric acid is introduced between the false and true bottoms, and made to permeate upwards through the ore mass. After the expiration of from 15 to 48 hours, the gas is found to appear abundantly on top of the ore mass, and is then shut off, and the vat allowed to remain a few hours under the influence of the gas. The cover being removed, pure water is added to fill the vat, even with the top surface of the ore, the fine particles of gold, under the action of chlorine, have changed from metal to a soluble ter-chloride, and in this condition it is drawn off or leached out with water, fresh being added until a test shows no trace of gold. A prepared solution of sulphate of iron—the usual precipitant—is carefully added to this drawn-off solution, and the gold thrown down as a black or brownish precipitate; this is then gathered, washed and melted into ingots of nearly pure gold.

Such is the general outline of the Plattner process. Of course the capacity of a vat is limited, much water used, and the working of each charge consumes from 20 to 72 hours. Hence, in case of large operations—many tons daily—the number of vats needed, the amount of water to be handled, would demand an immense space and a prodigiously cumbersome establishment.

These considerations, in addition to the dependence upon an expensive roast, have restricted the use of an agent for the extraction of gold, in all other respects unrivaled.

J. Howell Mears, M. D., of Philadelphia, experimenting, some four years ago, upon roasted pyrites, with small apparatus in his laboratory at home, had an accident happen, by one of the outlet pipes from the vessel in which he was exposing some ore to the action of chlorine, getting stopped, or clogged, which stoppage caused a pressure of gas in the vessel, and an explosion, whereby the whole thing was shattered.

As the exposure of pulp to gas had been for a few minutes only, he thought to try the thing over again, having for that purpose gathered up the sand, broken glass and debris; but, as it was inconvenient, from lack of apparatus, to expose the pulp again immediately, he tested the pulp to ascertain if any solution had taken place, and to his astonishment, found that the action had been about as thorough and complete as he was in the habit of finding it after hours of simply passing the gas into and through the moistened pulp.

Here was a discovery and on it is based the now perfect process, called after the distinguished discoverer; a process, however, which like the Plattner, has been perfected and made practical by the ingenuity and thought of many minds besides that of the original discoverer.

In the Meare process the roasted ore is moistened with a small amount of water (about two-thirds of what is required in the other process), then charged into an iron lead-lined barrel which revolves, and into which gas is forced, and thus constantly stirs and tumbles the ore. Several advantages are gained by this mechanical attrition. (1.) The ore is kept lively and every particle of it exposed to the action of the chlorine. (2.) If there be any large, coarse grains of gold present, instead of a coating of chloride of gold forming around them, and thereby preventing further action of the gas upon the gold grain, as is inevitably the case where the pulp lies still in a vat, the chloride of gold, as soon and as constantly as it is formed, is removed, thus keeping up a continuous action of the gas upon the gold, and consequently rendering the dissolving of a grain of gold as certain, and within reasonable limit, as speedily as if all the gold were of the finest powder.

This is a very important consideration, for I am convinced that in many cases, where sulphurets are treated by the Plattner process, and poor results or high tailing assays obtained, it is because the gold particles were so coarse as not to be entirely dissolved during the time allowed for chlorination, *i. e.*, that the solution was hindered by the protecting coat of terchloride of gold enclosing the gold particles and stopping further solution.

(3.) In California, a good deal of the gold in sulphurets, or rather, many kinds of sulphurets carrying gold and silver, have the gold so highly alloyed with silver that it is not easily dissolved by chlorine. I have found that it is almost impossible to dissolve this alloy of gold and silver contained in some of our sulphurets—in even nitro-muriatic acid—unless the coating formed on the gold particles is constantly removed by rubbing. I am of the opinion at present, that part of the silver becomes converted into a chloride, coats the particles of gold, and retards further action of the chlorine. This phenomenon occurs only in an alloy presenting a certain proportion of silver to gold. It is not universal, but it is common.

Roasted sulphurets carrying this kind of gold alloy, in a revolving barrel, treated with chlorine, present no difficulties, because by the mechanical attrition, this coating is scoured off by the sharp grains of sand as fast as it is formed, in a similar manner to the ter-chloride of gold previously spoken of.

The above advantages are undoubtedly accomplished by attrition, and are easily and speedily effected in this revolving barrel.

The pressure of gas which is applied while the barrel is revolving is gained by pumping the gas, by means of a peculiarly constructed and very simple pump, directly in through one trunnion of the barrel. The effect of pressure is also to hasten the action.

When the charge has been revolved long enough, the barrel is filled with water, thus liquefying the pulp, the bung is taken off, and the contents discharged into a filtering vat, through which the solution runs into precipitating tubs, where the gold is thrown down in the same manner as in the Plattner process. Or else, the solution is run through tanks packed with pulverized charcoal, which, of itself, precipitates and catches all the gold from the solution, and, after a time, the charcoal is burned and the gold collected. I prefer a precipitation by a freshly prepared solution of sulphate of iron, or ferrous sulphate.

Several plants embodying the Mears' process are in successful operation throughout the country, notably at the Bunker Hill mine in Amador county, Cal.

If there is any one thing new in the metallurgy of the future in California, it is, that more attention will be given to the concentration and chlorination of the gold-bearing sulphurets which are scattered in such profusion throughout our gold belts, for undoubtedly these sulphurets are the immense reservoirs of gold, and are so even in their quality and richness as to invite treatment at the hands of capital, when sure methods are discovered and perfected. It is, therefore, well, and in the interests of this State, that methods should be improved, and, when improved, described and made known through all medium at command, particularly through the way of such a publication as the PRESS, and I have, therefore, taken some pains to discuss what I know to be a perfect method of extracting gold from auriferous pyrites, or sulphurets, as they are commonly known here.

Debris Dams.

Resolutions Adopted by Miners in Convention.

The following resolutions were adopted at the Miners' Convention at Nevada City last Saturday:

WHEREAS, The mining industry in the State of California, but more particularly in the counties of El Dorado, Sacramento, Placer, Nevada, Yuba, Plumas, Sierra and Butte has been attacked by a limited portion of the agricultural districts in the Sacramento valley; and whereas, this mining industry, in which has been invested $150,000,000, and on which a population of over 125,000 people chiefly depend for subsistence, is harassed and attacked by litigation, which has continued for nearly four years with a persistence and animosity not often before exhibited; and whereas, if these continued attacks be ultimately successful, they will result in the almost entire destruction and depopulation of the mining counties; therefore, be it

Resolved, That we advise all the residents of the mining counties to act thoroughly in concert, and by all proper and lawful acts to defend and protect the mining interest, which is the paramount industry in these counties, and that while we deprecate all attempts of interested parties and local valley politicians to make the subject of our differences with the agriculturists a political issue, still, if such a fight should be forced upon us, we recommend such concert of action on the part of the miners as will frustrate the selfish objects of our enemies.

Resolved, That there is no confidence to be placed in the specious declarations lately made by the anti-miners to the effect that hydraulic mining is the only branch of that industry which they wish to cripple or destroy, for we believe that, should they be successful in stopping hydraulic mining, then both drift and quartz mines would be attacked, or, in any event, would be placed in great jeopardy, and could only continue their business upon such terms as the anti-miners might dictate. Therefore, we advise miners of all kinds to stand together, shoulder to shoulder, for mutual protection, and not to allow the misleading promises of our adversaries to divide our strength, that they may attack and destroy each interest in detail.

Resolved, That this meeting, which is composed of all classes in this community, embracing not only miners of all kinds, but also merchants, mechanics, agriculturists and laborers, fully realizes the fact that, if mining be stopped or seriously injured, it will result in destroying the value of all sorts of property in those now prosperous counties of Nevada, Sierra, Plumas, and the mining portion of Yuba county; we, therefore, acting in the defense of all classes, pledge ourselves to resist, in all proper ways, the attacks made upon us by the anti-miners.

Resolved, That while we admit that a certain amount of damage has been committed, consequent upon mining operations, yet this damage has been grossly exaggerated, and represents but a small percentage in value of the vast mining industry and the interests which directly and indirectly depend upon mining.

Resolved, That the miners are now, as they have always been, willing to do anything within their power, short of absolute confiscation of their property, to aid in any practicable way in preventing or diminishing such damage as their mining operations may cause upon the valleys below.

Resolved, That with the help of the aid proposed to be given by the general Government, it is now within the power of the miners, and particularly of the miners of the Yuba watershed, to prevent further damage by the construction of one or more dams across the Yuba river, for the purpose of impounding such debris as may hereafter find its way into that river, and also for the purpose of retaining the vast quantities of debris now in that stream and its tributaries from passing down into the plains; and while we waive no right of any kind, yet we advise all persons mining or interested in any way in mining upon the Yuba watershed, to join an association to be organized for the purpose of building or maintaining dams. We herewith submit articles of association for such an organization, which have been carefully prepared, and which we advise should be adopted either in their present shape, or as may hereafter, upon fuller discussion, be amended or changed.

Resolved, That so far as the filling of San Pablo and San Francisco bays is concerned, this filling results largely from agricultural and natural causes, and it is unjust to place any such damage solely upon mining.

Resolved, That as the rights and privileges of the miners have been recognized since the existence of the State, in all ways, by the executive, legislative and judicial departments of the general Government, and of the State, under which we have, in good faith, invested our means and established our homes, it is but just that the nation at large and our State, both of which have reaped such incalculable advantages from the product of our mines, should aid us in some substantial way, in bringing about a result which will permit mining to be continued without the vexatious litigation which has harrassed us for the past four years; and in the appropriation of $250,000 by the general Government for the protection of the Sacramento river, we gratefully appreciate this recognition of our just claim.

Resolved, That in consequence of the late opinion of Judge Temple, in whom we recognize an upright and non-partisan judge, we advise the miners upon the water-shed of each river flowing from the Sierra Nevada into the Sacramento or San Joaquin valley, to follow out the mode judicially set forth in that opinion, and to organize upon each water-shed, where mining is carried on, an association similar to that proposed for the Yuba river, and for the same purposes.

Resolved, That we do not acknowledge any irrepressible conflict between mining and agriculture, but we believe that both are mutually dependent one upon another, and we wish to emphasize the fact that while the agricultural lands damaged by mining operations represent only an infinitesimal part of the farming lands of the State, the product of our California gold mines of about $20,000,000 per annum represents over one-fifth of the entire gold product of the world. The stoppage of this product would inflict disaster, not only upon California, but upon every other State in our Union. We also wish to point out that our mining is not a decaying industry, as has been falsely stated, but is now thriving and full of promise, and we point with pride to the present prosperous condition of our mining counties, which compare most favorably in wealth, intelligence and prosperity with the other counties of the State. In no part of the world is labor better paid than in the mines of California. The miners have invested their earnings in making comfortable and beautiful homes for their families, and they live in greater comfort than does any other laboring class in our whole country. We respectfully suggest to the residents of the State at large that they cannot afford to see these prosperous mountain counties ruined because a few farmers have been injured.

Resolved, That action such as is proposed to be taken by the Yuba river miners in building dams will fully protect the valleys, and if accepted in good faith, will finally settle the existing differences between the mountain and the valley, and while assuming the expense of building these costly engineering works, we think we deserve the cordial co-operation and moral aid of persons in all parts of our State. We regret that the overtures made by the miners several years since to the people of Marysville and vicinity were not then accepted. Had we then joined together in building works of relief, the condition of affairs in the valley would be vastly better than they now are. We respectfully suggest to these gentlemen that it is even now more advantageous to them to do what they can in assisting us to relieve them from danger, instead of stubbornly endeavoring to thwart us in our proposed work for their benefit.

Resolved, That the Senators and Assemblymen of the whole State be respectfully requested to unite in the passage of such a law, or laws, as may be necessary to vest in us the authority to carry out our plans of impounding mining debris.

A Curious Aquatic Bird.

Our engraving gives a view of a curious aquatic bird, which launches its nest upon the water, and, it is said, practices the navigator's art, propelling its nest when danger threatens. It is such a performance which the artist has portrayed, the bird pushing off its nest preparing to alight upon it, very much as a man would shove off a boat and jump into it. Whether the artist has drawn upon his observation or imagination in putting the bird into just the position it occupies, we are not sure, but it is a fact that there are birds with floating nests, and we shall draw from good authorities in giving a brief account of them.

Dr. Coes, in his "Birds of the Northwest," describes the American eared grebe (*Podiceps Californicus*). He says:

I first saw the species alive in southern Cali-

THE GREBE AND ITS FLOATING NESTS.

fornia, where I found it to be very common, both on the waters of the bay of San Pedro and in the sloughs back of the coast. They were, of course, in immature dress, the season being November. During the past year I was pleased to find the birds breeding, in pools about Turtle mountain, with various other water-fowl. This is apparently the northeasternmost point at which the species has been observed. Visiting this locality in July, I was too late for eggs, for the young were already swimming, and, in most cases, fledged. The birds were very common, rather more so than the horned grebe, with which they were associated. Many specimens were secured in their full nuptial dress. The change begins in August, but it is not completed until well into the following month, as traces of the breeding plumage persist several weeks after it has grown faded and obscure. On the breeding grounds, as just said, the eared grebes were more plentiful than the horned, since a majority of the latter breed farther north; but upon the migration, when these come south, the proportion is reversed. Both species were to be seen together upon all the water courses of northern Dakota when I left the country in the middle of October. I saw nothing notably different in their general habits.

Other observers have found the eared grebe in full dress, and nesting, in various of our Western Territories, demonstrating a very general breeding range. Mr. Henshaw has lately taken the eggs in southern Colorado. He informs us that he found them, in the absence of parents, completely covered over and concealed by reedy material, so that they were discovered by mere accident. The following is his article in the "American Naturalist:"

"In a series of alkali lakes about 30 miles northwest of Fort Garland, southern Colorado, I found this species common and breeding. A colony of perhaps a dozen pairs had established themselves in a small pond four or five acres in extent. In the middle of this, in a bed of reeds, were found upward of a dozen nests. These, in each case, merely consisted of a slightly hollowed pile of decaying weeds and rushes, four or five inches in diameter, and scarcely raised above the surface of the water upon which they floated. In a number of instances, they were but a few feet distant from the nests of the coot (*Fulica americana*), which abounded. Every grebe's nest discovered contained three eggs, which, in most instances, were fresh, but in some nests were considerably advanced. These vary but little in shape, are considerably elongated, one end being slightly more pointed than the other. The color is a faint yellowish white, usually much stained from contact with the nest. The texture is generally quite smooth; in some instances, roughened by a chalky deposit. The eggs were wholly concealed from view by a pile of weeds and other vegetable material laid across. That they were thus carefully covered merely for concealment I cannot think, since, in the isolated position in which these nests are usually found, the bird has no enemy against which such precaution would avail. On first approaching the locality, the grebes all congregated at the farther end of the pond, and shortly betook themselves through an opening to the neighboring slough; nor, so far as I could ascertain, did they again approach the nests during my stay of three days. Is it not, then, possible that they are more or less dependent for the hatching of their eggs upon the artificial heat induced by the decaying vegetable substances of which the nests are wholly composed?"

An Old Mine.

We have been handed a copy of the 52d annual report of the St. John del Rey Mining Co., Brazil, and also the report of a mining engineer of this city to that company, which any of our subscribers who feel interested can see on calling at this office. The St. John del Rey company has the best record of any gold mine that we ever heard of, having been worked profitably and on an extensive scale for upwards of a half a century, and during the whole of that time under the management of German and English metallurgists and miners, noted for their scientific and practical knowledge. They have tried every new process that apparently had any merit in it. The roasting of the ore was experimented on years ago, and abandoned in consequence of the great cost and large loss of gold; besides, much better results were obtained by amalgamation of the raw ore.

The ore when delivered to the stamps contains about 60% of sulphurets. Very few of the mines in this State yield ore that has more than 3% in it. The arsenical pyrites in the St. John del Rey ore is the richest in gold. The ore, however, is too poor for amalgamation without concentration, and their principal loss is, therefore, in that process.

The report was published June 28, 1882, from which it appears that from April 12, 1881 to April 11, 1882 they stamped 63,939 tons of ore, yielding 34,443 ounces Troy. The gold contents per ton by assay showed gold 6.592 ounces per ton (say $13), out of which 4.722 ounces per ton was the amount obtained in milling, leaving 1.870 ounces in the tailings for each ton stamped, or a loss of 27 45%, nearly the whole of which is lost in the process of concentration. The net profit on the working for the year was about $153 000.

The width, character and general appearance of the lode in the sump section has been fully maintained, being 40 ft. wide, with from 30 to 35 ft. of mineral free from killas, and layers of arsenical pyrites having been occasionally met with.

In the report of the reduction works (page 44) it says: Three thousand three hundred and seventy-two tons of sand or concentrations were amalgamated in barrels with a loss of 1,671 lbs. of quicksilver, or about 8 ozs. to the ton of sulphurets amalgamated.

It was mentioned in last year's report that possibly grinding pans might be made to take the place of arastras. With this view, careful experiments have been tried with the pan as a simple triturator, but without success. The amount of grinding effected by this machine, or the sand operated upon, was so small that no head sand worth amalgamating was ever obtained. The use of the machine has therefore been discontinued.

In speaking of what are called revolving stamps on the California plan, the report says: This mill, consisting of 30 heads driven by a turbine, has been erected with gearing passes, tram roads, etc., complete, with the exception of some of the revolving strokes. This mill is an important and substantial piece of work, and its success is certain.

For the most of the year this has consisted of the machinery in the amalgamation house, and the California pan and settler; the latter have, however, been condemned, and, as before mentioned, this machinery will be replaced by a five-head revolving stamp. As the barrel accommodation is, however, small, it has been decided to take away the amalgamation arastras and erect six barrels and gear in their place.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncta for the proper working of Oold, Silver and Copper Ores, complete in every detail.

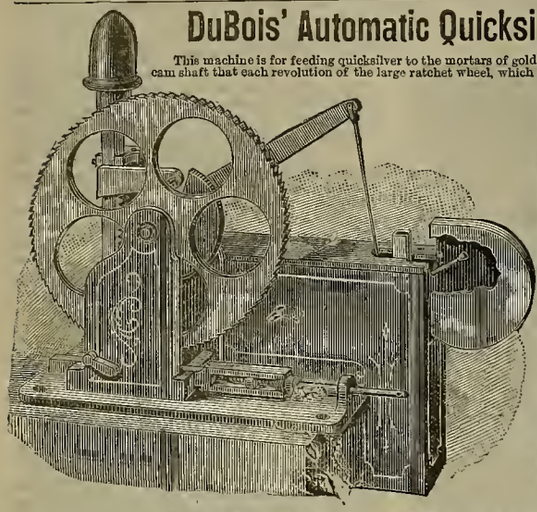
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pinc Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can he regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip nf the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven hy the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery nf ore to the mortar. As it is to he desired tn have the ore gn in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

A chief point nf excellence nf this machine is, that it allows the quantity of mercury which would he ntherwise fed in mass, in one hour, to he subdivided into a number nf small portions, and fed almost continuously, i. e., from every nne to four minutes.

Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents

22 & 24 Fremont St., San Francisco.

Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derivea its name from HERCULES, the most famous hern of Greek Mythology, whn was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those nf any manufactory in the West, our works having heen recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverheratory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupella tion Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.

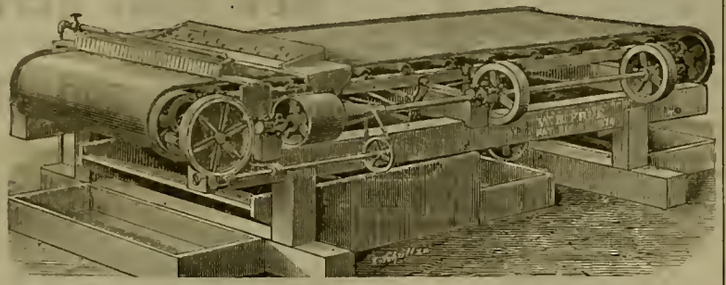
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.
☞ A machine with all improvements can be seen in working order and ready to make tests, at the office of Hickley, Spiers & Hayes, 220 Fremont street.
ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞ Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

THE CONSUMERS' COMPANY.

VULCAN B B,
The Best Low Grade Explosive in the market. Superior to Black or Judson Powder.
VULCAN NOS. 1, 2 AND 3,
The best Nitro-Glycerine Powders manufactured. Having secured large lots of the best imported Glycerine at low prices, we are prepared to offer the mining public the very strongest, most uniform and best Nitro-Glycerine Powder at the very Lowest Rates.
SPECIAL INDUCEMENTS IN PRICES.
Vulcan B B Powder (in Kegs or Cases) is Unequaled
for Bank Blasting and Railroad Work.
Caps and Fuse of all Grades at Bottom Rates.
The Central and Southern Pacific Railroads Use Vulcan Powder and no Other.

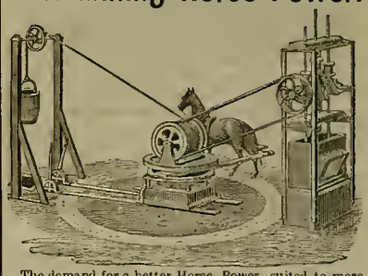
New Mining Horse Power.



The demand for a better Horse Power, suited to more general use, has resulted after much experience in the above machine, which we can recommend as a First-class Hoisting Power, under complete control of man tending bucket, through levers connecting with brake and clutch.
This power is light and strong, so that two or more horses can be used for crushing ore or other work.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR THE WEEK ENDING JULY 18 1882.

261,426.—BRAKE AND STARTER FOR STREET CARS—R. F. Bridwell, S. F.

201,206.—BALANCE SLIDE VALVES—John B. Conrad, Portland, Oregon.

261,434.—DEVICE FOR REMOVING SNOW AS IT FALLS UPON AND CONTINUOUS TO RAILWAY TRACKS—L. D. Craig, S. F.

261,332.—CHAIR BRACE—John A. Gallagher, Chinese Camp, Cal.

261,340.—WATCH OILER AND HOLDER—F. Gundorph, Portland, Oregon.

261,156.—SOAP TABLET—W. J. Houston, S. F.

261,439.—SHOE—Loo Chu Fan, S. F.

10,191.—REFRIGERATING BY MEANS OF AMMONIA—R. H. Lucas, S. F. (re-issue).

261 360.—SOLDERING MACHINE—A. Lusk, S. F.

261 372.—TWO-WHEELED VEHICLE—D. R. McLennan, St. Helena, Cal.

261,248.—CARPET SEWING MACHINE—A. Neustadt, S. F.

261,255.—VEHICLE BRAKE—R. M. Quackenbush, Santa Rosa, Cal.

261,386.—SULKY HARNESS—John W. Rush, Stockton, Cal.

261,405.—PRESERVING PILES—William Taggart, S. F.

261,182.—GANG PLOW—Edward Topham, Milpitas, Cal.

261,370.—RAILWAY TRAIN TELEGRAPH—Charles F. McGlashan, Santa Barbara, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

PRESERVING PILES.—Wm. Taggart, S. F. No. 260,405. Dated July 18, 1882. This process of preserving timber is more particularly intended to prevent the action of the teredo and other destructive marine insects. A hole is bored through the pile longitudinally, extending to the mud line. A steam pipe is first introduced to the hole, and steam, under pressure, is injected into the pile until the sap is expelled and the pile is entirely steamed through. Then a peculiar preservative solution is poured in, and is forced through the pores by hydraulic or steam pressure. The hole is then filled with solution, and plugged up. This treatment, it is claimed, will prevent the entrance of the teredo into new timber, and will drive the worm out of piles where it is already at work. The treatment may be repeated from time to time.

CHAIR BRACE.—John A. Gallagher, Chinese Camp, Tuolumne county. No. 261,332. Dated July 18, 1882. This covers improvements on a previous patent by the same inventor. It consists in the combination of centrally converging leg brace rods or wires and the tightening plates and screw described in the former patent, with brace rods for the back and arms, whereby by the operation of the tightening plates and screw—not only the legs but the back and arms—are affected. The object is to provide a simple and complete brace for a chair, which, by the movement of a single screw, will tighten up all its parts, rendering it as firm and secure as at first.

SOLDERING MACHINE.—Albert Lusk, S. F. No. 261,366. Dated July 18, 1882. This apparatus for soldering cans is intended for use in large canneries. By means of it any size or form of float may be used, either square, oblong or round, and in size from a large coal-oil can down to a half-pound round can. The exactness of the peripheral guides and stops enables the inventor to solder large cans with great accuracy and rapidity.

TWO-WHEELED VEHICLE.—Daniel R. McLenan, St. Helena, Napa Co. No. 261,372. Dated July 18, 1882. This invention consists in placing ordinary elliptical springs upon the sides of the vehicle, in securing side-supporting bars upon said springs, and in sustaining the body upon transverse body loops extending between the ends of the supporting bars. This is done so as to overcome the "jogging motion."

SULKY HARNESS.—Jno. W. Rush, Stockton, Cal. This invention covers certain improvements, consisting in certain details of construction in the arrangement of the teeth, etc.

HIGHLAND SPRINGS.—This old and popular resort in Lake county, has been largely patronized this season, under the new and skillful management of Dr. C. M. Bates, of San Francisco. Its guests have included an unusual number of leading and well-known citizens. All seem well pleased with their sojourn at the springs, beautifully located, as they are, in a remarkably healthy climate. Those intending to go into the country, for health or pleasure, will find some facts and information worth noting, concerning these springs, in our advertising columns.

THE Marysvile *Appeal* says that $80,000 is needed for levee work in that vicinity.

THE Nevada City *Transcript* says: Seeing that the hydraulic miners are willing and anxious to comply with Judge Temple's decision, and thereby put an end to the existing trouble, and on the other hand, the enemy are doing everything to prevent a settlement, the quartz and drift miners have become alarmed at the situation, and will, in the future, stand in firmly with the hydranlicers. Now they will work in harmony for the mutual benefit of our people. The new Yuba county suits have done the business, and the anti-miners have no one to blame but themselves, let the outcome of this trouble be what it may.

THE HARMON SEMINARY.—The buildings of the Harmon Seminary for Young Ladies at Berkeley are now complete and are highly praised by all who visit them. There will be pleasant rooms, for about 50 girls and is not expected to increase the school beyond that number, as the principals believe that better justice can be done to a small group than to a large number of pupils. The school will open on Thursday of next week, Aug. 3.

STANDARD LUBRICANTS.—E. B. Read, of 419 California street, is sole agent for the New York Refining Co.'s standard lubricants, cylinder and machine oils; also for the Standard axle grease and carriage lubricant for light axles, harness or any leather. The Standard lubricant is put up in 5-lb., 10-lb., 30 lb. and 50-lb. tin cans. Mr. Read has in stock a full supply of sheet cast bars and sheet zinc cups.

For Sale.

A twenty-stamp steam mill, complete and almost new. Also, air compressors, drills and mining machinery. Anyone having a gold or silver mine warranting the investment, may buy this material on time by making monthly or quarterly payments. Address, CHARLES F. SHERMAN, Havilah, Kern County, Cal.

Back Numbers Wanted.

We will pay 10 cents a copy for the following numbers of the MINING AND SCIENTIFIC PRESS: Volume, 13; year, 1866; number, 1. Volume, 18; year, 1869; number, 5. Volume, 20; year, 1870; numbers, 1 and 26. Volume, 22; year, 1871; number, 1. Volume, 30; year, 1875; numbers, 2, 3, 4, 7, 10, 11, 12, 13 and 15.

DEWEY & CO.,
252 Market St., S. F.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

A TORNED LEAF will point out the article supposed to be of special interest to persons receiving sample copies of this paper.

ANNUAL STATISTICIAN of 1882.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 502 Taylor st. Price, $4.

Mining and Other Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

Seaton Gold Mining Company.—Location

of principal place of business, San Francisco, California. Location of works, Drytown, Amador Co., California.

NOTICE.—There are delinquent upon the following described stock, on account of Assessment No. 1, levied June 6, 1882, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No of Certificate.	No. of Shares.	Amount
Martin, A. (Trustee).....	8	5000	balance, $200.00
Martin, A, (Trustee).....	9	5000	750 00
Martin, A, (Trustee).....	20	500	75.00
Martin, A. (Trustee).....	21	500	75.00

And in accordance with law, and an order of the Board of Directors, made on the 6th day of June, 1882, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at 528 California St., Room 6, San Francisco, Cal., on Wednesday, August 16th, 1882, at the hour of 4 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expense of sale. A. MARTIN, Sec'y.

OFFICE—Room 6, 528 California St., San Francisco, California.

IMPORTANT SEMI-TROPIC COLONY ENTERPRISE.

The Fairest and Best of Colonies.

THE REDLANDS,

In San Bernardino County, California.

Superior Soil, Climate and Irrigating Improvements.

The following information concerning one of the best-reputed and promising colony enterprises in southern California, is from the Riverside *Press*, of San Bernardino county, April 1, 1882:

A Model Settlement.

No place in California has sprung into public notice so rapidly and gained so deserved a reputation in so short a time as has the new tract of Redlands.

This tract is located between Old San Bernardino and Crafton on the south side of Mill Creek ditch and comprises 2,500 acres of as choice fruit lands as can be found in the State. The land is of a reddish clayey loam, not clayey enough to work hard, having sufficient admixture of sand to hold moisture and give the best results when planted to orchard or vineyard. The red lands of the State are everywhere celebrated as being superior for tree and vine.

The tract slopes to the northwest and commands one of the grandest views to be found in the State. To the north and northwest lies stretched out, several hundred feet below, the San Bernardino valley, with the towns of San Bernardino and Colton plainly in view, while, looking to the westward at night, the headlights of the Eastern-bound trains can be distinctly seen for 40 miles. Beyond the San Bernardino valley to the northwest, and stretching around to the northeast, the chain of mountains tower 9,000 ft. above the sea level, culminating in Mount San Bernardino, 11,000 ft. high, and Grayback, 11,550 ft. high, both of which stand up boldly from the Redlands point of view, and whose tops are covered with snow more than half of each year. Around to the left of the picture are the Cucamonga peaks, 40 miles distant, which complete the semi-circular mountain chain that makes such a beautiful background to the landscape. For mountain and valley scenery no more beautiful location can be found in the State than Redlands, outside of Yosemite valley.

Redlands is located 10 miles from the county seat, the same distance from Colton, and 15 miles from Riverside. The track of the Southern Pacific railroad runs one and a half miles from the center of the Redlands tract, and a depot will be established at once for the accommodation of Redlands, Lugonia, Crafton and Old San Bernardino.

The Redlands tract is laid off by running avenues from northeast to southwest, one-quarter of a mile apart and cross streets at right angles to those avenues every half mile, thus cutting the tract into blocks, each of which contains 80 acres. The avenues are each 100 ft. wide. The cross streets are 60 ft. wide.

Although the first work done on the tract by settlers could not be commenced till about the 1st of January, 1882, there are at the present time some 10 or 12 houses erected and in process of erection, with several to commence work soon. A number of tracts, in addition to those on which houses are being built, are being plowed up and planted to orchard and vineyard.

The lateness in the season when the land was bought by purchasers, prevented many from getting their land set out to trees or vines this year, but all who have purchased are making arrangements to plant extensively next winter and spring.

Town Plat.

Near the center of the tract is a town plat, consisting of 140 acres, cut up into lots ranging from an ordinary business lot to two and a half and five acre residence lots. Within this town plat, at the crossing of Palm and Center avenues, is a circular public park, with a fountain in the center. This park will be improved by the proprietors of the tract. Above the town plat will be constructed a small reservoir, from which iron pipes will be laid to supply the town with water under pressure.

The Water System.

Is one of the most perfect in the State. The water supply comes partially from the South Fork ditch of the Santa Ana river and partially from private water developments in the Santa Ana canyon and other localities. The waters are to be conducted to a large reservoir, located in a canyon adjoining the tract, and distributed from this reservoir by means of cement pipes. These pipes will be so laid as to carry the water without loss to the highest point on each ten-acre lot. The basis of water supply is one inch of water, statute measurement, to each eight acres of land. This is ample, and up to the best irrigated tracts in the State.

Work on the water system is being pushed as rapidly as men and money can do the work. The dam to the reservoir, which is ultimately to be 60 and perhaps 80 ft. high, is now about half done; the iron discharge pipes and watergates are in position, and nearly four miles of the largest distributing pipes are already manufactured, and most of this is laid. This portion of the work embraces the 8, 10, 12, and 14-inch pipes—the heaviest portion of the work. The smaller pipes, none of which will be less than four inches, will be made and laid as soon as the larger pipes are completed.

The orange, lemon, apricot, peach and raisin grape, will grow here to perfection.

Following is a list of the property owners at the present time. Those who have moved upon the tract are credited to Redlands, and the others to localities where they now reside:

Total sold	1,004

Judson & Brown (San Bernardino, P. O.), owners of the tract, are energetic men, who leave no stone unturned to make their enterprise a success. They do not try to figure how little they can do and sell their land, but where they can put another thousand dollars and make the tract more desirable to first-class settlers. There is nothing shoddy about their operations. Redlands will stand in a few years as one of the finest settlements on the Pacific coast.

NATIONAL COMPRESSORS and ROCK DRILLS.

REYNOLDS & RIX, Agents,

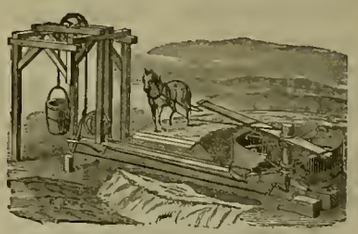
No. 49 Fremont Street, San Francisco, Cal.,

MANUFACTURERS OF AND DEALERS IN

Mining Machinery.

We manufacture the BEST **Air Compressors** Ever driven by belt from Water Power.

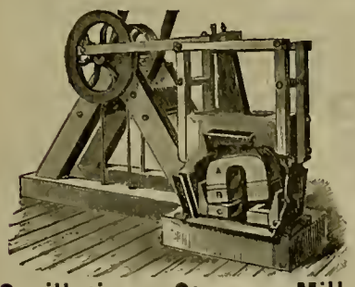
Hoisting Rigs, **DONKEY ENGINES** For Pile Driving. **MINING CARS,** Ore and Water **BUCKETS.**



MINERS' HORSE-WHIM.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all frame work. When required these whims are made in sections to pack on mules.

MILL AND MINING MACHINERY.



Oscillating Stamp Mill.

Is has no Stems, Cams, or Tappets, and adjusts itself to the wear of the Shoes and Dies.

For simplicity, economy, durability and effective working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power. Awarded First Premium and Medal at Mechanics' Fair, S. F., 1880.

Manufactured by

F. A. HUNTINGTON, 220 Fremont St., S. F., Cal. | FRASER & CHALMERS, 145 Fulton St., Chicago, Ill.

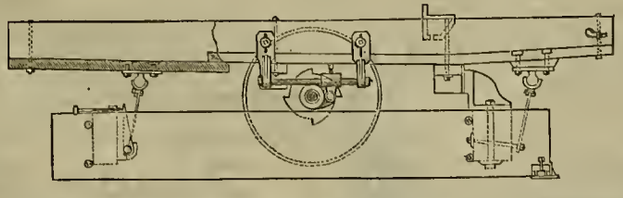
Improved Patent Grinding and Amalgamating Pans, Concentrators and Gold Amalgamators; also, Steam Engines and Mining Machinery of all kinds. Send for circulars.

F. A. HUNTINGTON,

220 Fremont Street, San Francisco, Cal.

F. A. HUNTINGTON,

No. 220 Fremont Street, - - San Francisco, Cal.

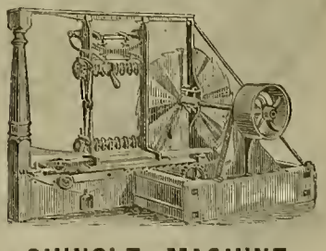


PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in very short time. One machine will concentrate the tailings from a five-stamp battery.

☞ Send for Circulars. ☜



SHINGLE MACHINE.

For simplicity, durability and rapidity of action, these Machines have no equal, cutting from 3,000 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

SAWMILL MACHINERY,

Of all descriptions made to order.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressnre. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are teeted for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocke to which Powder ie liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS.
☞ Send for Pamphlet showing methods of testing the different qualities of all Powders.
The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT, No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." t is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can he used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

VOLUME XLV Number 6

Lead Poisoning.

Few people, with the exceptioa of those who are brought into immediate contact with the metal, hy reasoa of their employmeat in haso mstal miaes, smelting faraaces or painters' materials, have aay idea of the horrors or results of lead poisoaing. It is aot aloae the immediate danger to life, nor the pain and debility produced hy this diseaso which are its most unpleasaat featares. Prohahly the most awful result to ho coatemplated hy those uafortuaatos whose hlood hss heea impregaated with this poison is, that the disease is iaherited by their ohildrea, ia the ssme manner as some others of the most terrihlo diseases kaown to the human race. It is still a mooted questioa whether the poison remaias in the system of ohildren so inheritiag; bnt the fact remains, that the ohildren horn of parents who are so poisoned, come iato the world covered with hoils and nloers, aad in maay cases die immediately after hirth; and tho burden of proof goes to show that the poison remsins in the hlood indefiaitely, appearing on the surface in the form of eruptioas, periodioally.

Ths first symptom of lead poisoaing is a severe colic, followed hy debility, aad a whitening of the skin. Other symptoms of the presence of lead poison in the hlood are dizziness in the morniag, with failiag sight, and an increasing deafaess, very mach the same symptoms as appear when the liver is oat of order. Persons snfferiag from this poison are very liahle to have the slightest cold turn into paeamoaia, as it weakens the laags, and loaves them an easy prey to thst terrihle disease.

Whea persons are attsoked very severely hy lead poisoning they of conrse take it in hand, and hy the use of a milk diet, and hathing in and drinking mineral water whioh is strongly impregnated with sulphur aad carholic acid gas, and hy a geaeral toaic treatmeat, they eliminate the poison from the system; hut where the attack is slight, ia many cases, very little attention is paid to it, and, in time, it becomes chroaic, and resalts in years of misery, whioh is attrihuted to aay other than the right canso. Of course, the poisoaiag very often proves fatal, hut we are merely dealing now with the ills that accrue to the liviag. It is mnch easier than is popalarly supposed to he placed in danger of lead poisoning. It is not necessry to work in lead mines, over smelting furnaces, or in mixing the paint known as white lead, to contract this disease. The fumes comiag from the chimneys of smelting farnaces, hreathed hy persoas on the street, are liahle to cause lead poisoning; the drinking of water which hae lain in lead pipe for a short time, salts of lead produced from the lead lining of tea chests, where moisture reachee the tea; and, in fact, in every article of consumption which is hrought into contact with lead, in any way, where there is the least fermentation or moistnre, there is great danger of lead poisoning.

In Germany a movement is on foot looking to the passing of a law prohihiting the importation of tea in lead-lined hoxes, and thie hrings us to a danger which is little appreciated—the danger of lead-poisoniag from drinking tea which has heen imported in lead-lined hoxes. The lead is nsed to preserve the flavor and aroma of the tea, which would he lost were the air allowed to reach it, hut while it has the desired effect of preserving the flavor and aroma, it createe a danger of lead-poisoning; and it is a thing to be noticed, in this connection, that women, who are the principal tea drinkers, suffer very much from symptoms such as would he produced hy lead poison, ench as colic, dehility, swimming in the head and a whitening of the skin.

Many merchante in America, heiag aware of the danger of so lining tea hoxee have suhstitnted tin for the lead, and where these tea cans can he put together without the use of eolder, they wonld have the effect of holdiag the flavor and aroma of the tea, without the danger which oomes from the use of lead.

This matter of lead poisoning has not received snfficient attention from either the people or the law-makers in this country, and some psople even consider it is time a law was passed prohihiting the nse of solder in pntting np canned goods,

Suspended Gold.

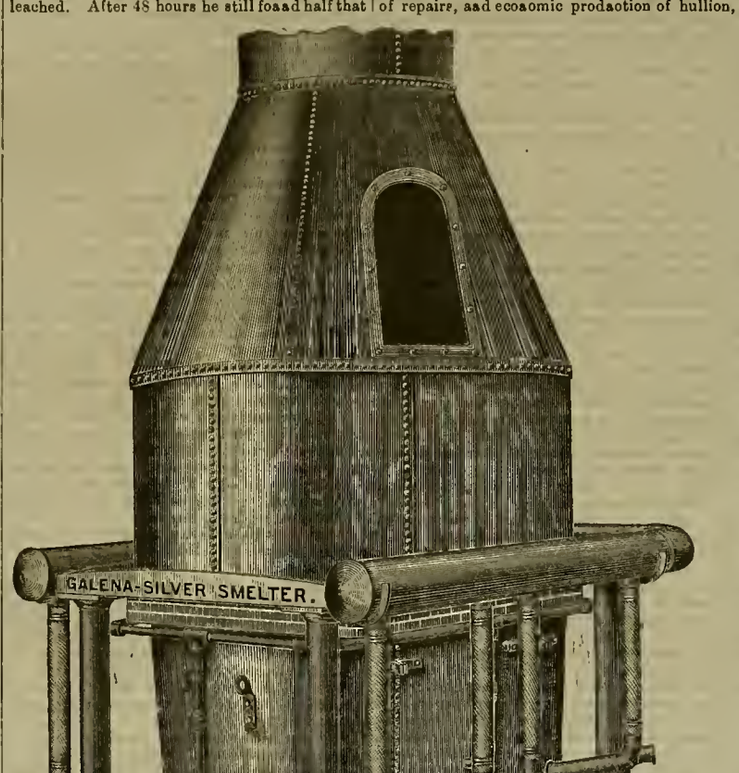
By takiag some of the waste liquor from the gold tah, filteriag twice throagh Sweedish paper, aad then smeltiag the paper with litharge, Mr. C. H. 'Asron found that after 24 hours' settliag there remaiaed gold in suspensioa, equal to $1 in value for each toa of ore leached. After 48 hours he still foaad half that quantity. The filtrates from these tests were hoiled with zinc until all precipitahle metals were thrown down. The precipitate contained no gold, which shows that iron perchloride does not dissolve gold in presence of the iron protosalts, thus setting at rest a douht which had arisen, as to whether or not the precipitated gold might he, to some extent, re-dissolved hy remaining for many hours in contaot with the eolution of iron persalts, which is produced when gold terchloride is decomposed hy iron photo-snlphate.

THE hed of the Klamath river is heing mined more extensively than ever this season, and heaps of gold-dnst will he taken out. A company composed of Kanakas own one of the hest claims.

E. T. GEORGE ie Commissioner from the State of Nevada to the Denver Exposition.

The Pacific Galena-Silver Smelter.

This smelter as aow construoted, embodies the resalts of more than twenty years' experience, observation aad stady as to the reqairements of this method of treatiag ores. The remarkahle results ohtained from it regarding capacity for oontinnous work, minimnm cost of repairs, aad ecoaomic prodaction of hullion, fairly entitle it to he considered as the most improved type of smelter now made.



THE PACIFIC GALENA-SILVER SMELTER.

The special advantages claimed for this smelter may he enumerated as follows: The water jacket is made in sections—two or four according to size—so that any of them can he removed without disturhance to the rest of the furnace, making all parts accessihle for cleaning out, and repairs when necessary. With a large plant, extra sections may he provided which can he quickly put in place in case of leakage or accident to one of them, thus securing against any loss of time in rnnning.

The jacket is made of wrought iron, and can he easily repaired in case of leakage. Cast-iron jackete are heavy for freighting, liahle to crack, and are then worthless. The whole structnre is made complete at the shop, constructed mostly of wrought iron, to insnre strength and lightness, and in sections, to facilitate transportation and setting up, no brickwork heing reqnired, exoept for oraoihle and two courses on top of jaokct, making the cost of erection less than half that of aay other style of smelter.

Pateat circalation plates are pnt iato each sectioa of jaoket ia suoh a way as to secnre a rapid circulation of water. This preveats any scale from forming on the inner surfaces of the plates from the action of mineralized water, reduces the temperature, and prevents the overheating and hurning ont so common in all other jackets.

Experience has shown this to he the most valnahle improvement ever made in water-jacket smelters, adding at least two or three times to the effective wear and service of the jacket, besides saving in loss of time and cost of repair. The use of these plates also saves at least one-half the water reqaired in other jackets—a poiat of such importaace in localities where water is scarce.

A hoiler-iron foundation aad curh are provided, inside of which the whole structare is huilt. This is to prevent any escape of hullion in case of leakage from the orucihle, which ofta occurs, involving serious loss without aay meaas of detecting it. Instances have come to our knowledge where large sums have heen saved in this way.

The lead-well is located ontside the Jacket, into which the metal is run and kept hot hy a small fire, while the dross snd other impurities can he skimmed off hefore heiag ladeled into moulds. The tuyeres are made in the jacket, and, heiag surrouaded with water in active circulatioa, never hurn out. The jackets are rectangular in form with ronad eads, giviag no corners for the accumulation of slag, which toads to hridge the ore and preveat it from coming in contact with the hlast.

The arraagement of the tuyeres and the distrihution of the hlast are such as to avoid dead centers, secare perfeot combustion and the most economical results from fuel. In the larger sizes both ends are provided with chargiag doors aud slag discharges.

These smelters are made of 10, 20, 30 aad 40 tons capacity, the larger sizes heiag recommended as the most desirahle where the ore development will warreat it, as they oan he run more economically, hoth as regards fuel and attendance than the smaller.

When larger capscity is wanted, the manufacturers recommend dnplicating the 40-ton stack rather thaa makiag them larger, though they make them of 50 and 60-ton capacity when desired. They are adapted to any class of galena ores, whether free or hase, the successful working of which heing merely a matter of fluxing.

With single stacks, separate engines are provided for hlower and crusher, to insure a steady hlast. In larger plants, a Wheelock automatic cutoff eagine is recommended, with power of all requirements. Downcasts made with steam or water jets, to condense the vapors and save the fine dust, furnished when desired. The great drawhack to the successful treatment of ores hy the smelting process, it is well known, has heen the want of a smelter that could he run continuously without stopping frequently for repairs, two stacks heing ordinarily reqnired to keep one in constant hlast. This difficulty has been overcome in the smelter herewith presented, which, with the care ordidarily given a steam hoiler, can he run as long, and with as little lose of time or expense for repairs.

The reoord shown hy this furnace is suoh as to satisfy any one interested of tho claim of superiority here made. The success of these smeltere has led to imitations, but tho most valuahle improvements are secured hy patents, which cannot he infringed without liahility. Rankin, Brayton & Co., of the Pacific Iron Works of this city, who are making a specialty of furnace work, are the manufacturers.

THE new 10-etamp farnace mill of the Columhia & Beaver Co., at Sawtooth, Idaho, will etart up hy the 10th of August. This company has invested nearly $150,000 in the vicinity of Sawtooth.

THE Supervisore, sittiag as a Board of Equalization, are reducing the Assessor's valuatione of hydranlio mining properties of Nevada county. The reductions made are at leaet one-half.

Forest Trees of California.*

Western Juniper.

(Juniperus Occidentalis.)

"And as Elijah lay and slept under a juniper tree, behold, then an angel touched him."—*Ancient Book of Kings*, Vol. I: xix, 5.

The Western juniper is one of the most vsnsrable and pictnrsqne trses ot all the higher regione of California—venerable as to appearancs, and for the vast antiqnity of the larger trsss, which date far back, nearly to the great *Sequoian* age; and picturesque, for oftsn hundreds, nay, thousands of miles may hs travcrsed without meeting a single psrfect tree. All seem mors or less dismantled, or the top altogsthsr carried away hy storms or the sverrecurring snow-slides. When viewiug these vetsrans, let us hear in mind they have hraved the sventful cycles of time, that are measured hy many thousande of years, with a vitality almost equal to the olivs tres. If killed hy any causs on ons side, ths othsr still goes on its life-long journey, eccentrically developing, until the invsstigator finds it convsnient to take bearings in order to determins the original center. This hroad hase of accslerated expansion is always more or less unsymmetrical hy thoee hig hars of ewelled or anguloid eccsntricity so sminsntly characteristic. Ahove, it rapidly tapsrs to an attenuated top. Whole grovss of the typical tree may he sometimss sesn 40 to 50 ft. high, from a hody 8 to 10 ft. in diameter of the most perfectly fres and unmolestsd dsvelopment in relatively rich soil at the head of Carson river, or in a few of the moet favorahle cold alpine valleys.

The hark is of light cinnamon color; fihers somewhat ehrsddy, which hsantifully interlace, and are nicely nettsd. The finely, as it wsre, hraided cord-like twiglsts ars rsmarkahly condensed, or mattsd, thickening the final spray. Thus it wsll maintains ths expression of rigorous vitality, altogether suited to the psrilous regions it inhahits—that is, along rocky mountain sides, mostly in closs cont'guity to the line of psrpstual snows; or for the California Sierras, say up to about 10,000 ft. altitude. It has also a very sxtensivs range of country from Pitt rivsr to sast of ths Cascades, in Orsgon, and throughout our high Sisrras, and toward the Rocky monntains, until it meets the Red Pencil csdar, or Eastern jnnipsr (*J. Virginiana*), in the Znni mountains ot Mexico, and even into Texas. The wood of this, however, is not so red insids, nor so fragrant, but lighter and yellowish; is equally durahle and of like value. The tiny lsaf-scales ars fringsd on ths margins (the Eastsrn lsaf msrgins are smooth), and hranchlets four-angled; leaf-scales mostly in thress, often in pairs, blunt tipped or ecarcsly a little eharp, mors resinous and silvsry shsened. In the young state the glands are obscurs; manifsst enough in age. Ths hlus-bloomed herriee are rather largs, over a third of an inch in diametsr, spheroidal, ons or more seeded, the color heneath the hloom hrownieh and sweeter tasted, when hsated or hurned exhales a dslightfnl, aromatic inosnse, hoth exhilarating and highly salubrioue. They also furnish boughs and twigs for a durahle esculapian hed for ths feebls pilgrim who is wise enough to spend a season of rejuvenation in the mountains and spread his primitive couch of them hesids their all-glorious camp-fires. As these ecstatic aromas excite the affections and promots gratsful psrcsptions, whence is all trus adoration and hlessedness, it is no wonder the prophet felt the angel touch him—an angsl of health, if no other—nor that our ssge ancestors hurnt the juniper around their dwellings to ksep away svil spirits, or exorcise the demons of infection and every sort of plague, and held that an espscially fortunate family, which was willing and well to do, witbal so scrupulously neat as to strsw faithfully their floore every Friday with some of these hranchss. We dars say, along their dsvout footpaths arose soms hallowed incense from the family altar.

Finally, if we view this tree securely sheltered from its manifold misfortunes that overtake it in ite more exposed haunts, say in high mountain vales, or along the hanke of those streams, it hecomee a very handsome tree. One can scarcely realize the great contrast of elegance and heauty. Perhape, among a thousand expressions, the moet general and striking is that stuhhorn air of death-grapple, and evermore irrepressible conflict of these veterans of a thousand ware against all the combined elements of earth and heaven. Offset to this conic top of well-defined, softly green, and graceful houghs and body, you still hehold maintained the perfect symmetry of strength helow. Or, yonder stands the usual type, a tree well-nigh in ruins, perchance bygone greatness half in ruine, with modern repairs; or, it may he only a relic of passed glory, now lonely and neglected, here and there venerahle and grave, anon grotesque, always in a high degree picturesque. But, really, who may tell all the varied expressions of this marvelous great Far Western juniper?

To dwell upon its durahle timher qualities would he to repeat the lore of cedar and juniper renown—as live fences, rock and wall screens, naval knees, hoats, common carpenter and cahinet work, and all uses where light, close-grained, eoft, smooth and compact wood is wanted.

*From "The Forest Trees of California," by A. Kellogg; published by the State Mining Bureau. State Printing Office, Sacramento, 1882.

A GRAIN of iron may he divided into 4,000,000 parts. Gold may he hammered so fine that it will take 1,360,000 leaves to make an inch in thickness.

Water Rights in California.

Now that the resources of the State are heing so rapidly devsloped hy the aid of irrigation enterprisss, all intelligent contrihutions to the litsratnre of watsr rights shonld hs pnt on record for the consideration of those interestsd. In this matter, as in most othsr matters of industrial importance, there are conflicting interests and claims, and it is essential that there should he a clsar and gensral understanding of existing lsws affecting ths points in question. Hon. J. W. Shanklin, Surveyor-General of the State, has prepared a rsviaw of California irrigation laws, which was puhlishsd in the *Record-Union*, of Sacramento. That his understanding of ths stsnding of rights before the law may he gsnerally considersd and discussed, we reprodnce his statement, as follows:

The Legislature of California has lsgislated on four different methods of irrigation.

First, for tbe control of the water courses, ths hnilding of canals or ditches, and the distrihution of the watsr for the psopls in the counties where irrigation was considersd nécssary. This law was passed May 15, 1854, and csn hs found on page 76 of the statutes of that year, and was applisd to the counties of San Disgo, San Bernardino, Santa Barhara, Napa, Loe Angeles, Solano, Contra Coeta, Colusa and Tulare, the prssent county of Kern heing then included in Los Angsles and Tulars, and governed as to irrigation hy the same law.

This law, as to Los Angeles county, was never modified or repealed nntil March 10, 1874 (Stat., p. 312); and as to Tulare county, for ono lins of canal, a spscial hoard of commissionsrs was crsatsd March 15, 1864 (Stat., p. 167), indepsndent of the hosrd created by the Act of 1854, hut for the county gensrally on April 4, 1864 (Stat., p. 375), a law modslsd after the law of 1854, though modifying it somswhat, was passsd. Again, on ths 20th of March, 1866 (Stat., p. 313), ths law of April 4, 1864, was amsndsd. Thus ths law of April 4, 1864, as amended, applying to Tulare county, and the law of May 15, 1854, applying to Los Angelss county, 'pointsd out the only mode of irrigation applicahle to the territory out of which Kern county was creatsd on the 2d of April, 1866 (Stat., p. 777).

So carsful was the Legislaturs, or rather the Rsprssentativss of Tulare county, to guard against the introduction or rscognition of any othsr mode of irrigation in ths county, that Section 12 of the Act of April 4, 1864, provided that "all acts of a general character conflicting with the provisions of this, so far as applicahle to ths county of Tulare, are hsrehy repsalsd," thus guarding effactually against allowing corporations to opsrats in the county undsr the assumption that they had authority given them under the Act of May 14, 1862 (Stat., p. 540), which was the second law providing for irrigation.

Again, so careful wers ths Representatives of Kern that when the law of April 1, 1872 (Stat., p. 945)—the third law providing for irrigation—was psssed, allowing districts snsceptihle of ons mode of irrigation to he crsatsd, Kern, as well as Fresno, Tulare and Yolo counties, were excepted from its opsration. (Sse Section 20, Stat., p. 948.)

Again, when the fourth mode providing for irrigation was created hy the adoption of ths codes (ses Civil Code, Sections 1410 to 1422), Section 19 of the Political Code exprssly said that "nothing in either of the four codes affects any of ths provisions of the following statutes," viz. (subdivision 6): "All scts creating or regulating hoards of water commissionsrs and oversssrs in ths sevsral townships or counties of the State."

This hrings us up to the last law psssed on ths subject of irrigation for Kern conty, viz.: the Act of March 29, 1876 (Stat., p. 547), which does not differ materially from the previous acts, except that it changes the organization controling the water coursee from a hoard specially elected for that purpose to the Board of Snpsrvisors, who have general charge of all county mattsre. This shows that the county did not intend to lose control of its water rights, the prevention of waste and the economical and equitable distrihution of the water for the general good of its people.

Following this, the next Lsgislature memorialized Congress hy joint resolution, passed March 6, 1878 (Stat., p. 1,070), "to reeerve from sale, or grant no exclusive ownership," all streams of sufficient magnitude to eupply more than one family, so that the water might he free, and "for the common use of all the inhahitants, for the natural purpoees of drinking and washing, for man and domestic heasts, for irrigating the soil, and for mining purposes."

Of what use would a memorial like thie have heen if the State had already allowed private appropriation to seize or absorh under corporate control the watere of thie State capahle of heing utilized for irrigation? It clearly shows that the people of the State, expressing their will through the Legislature, did not consider that they had granted away their right to control the waters of the State for the general good, and that corporate interests had become paramount in controlling the water courses. Following up this line of action, the Constitutional Convention, hy Art. 14, Sec. 1, declared "the use of all water now appropriatsd or that may hereafter he appropriated, for sale, rental or distrihution, is hereby declared to he a puhlic nee and subject to the regulation and control of the State in the manner to he prescribed hy law." This emphatic declaration, that the use of all the water of the State is a public nse, was ratifisd hy the people; and the manner of its nss ie not left to laws of ths past, bnt in the language of ths Constitutiou, is to bs prescrihed hy law. Where, then, are vested rights over the control of watsr and rights hy presumption so loudly asssrted hy corporations? And as though either principle could prsvail against the sovsreign (the Stats) when the vsry Act granting them an existence (stat. 1850, p. 350, sec. 30) declares that "the Lsgislatnre may, at any time, amend or appesl this Act and dissolve all corporations crsated under it." The creation is not ahove the creator, and the commonly expressed fear of corporations or othsr organizations in controlling ths waters of the State to the dstriment of the peopls, only argues the imhecility of the psopls in not rsgulating the mattsr through the Lsgislature to suit themselves, or in not forcing the Snpsrvisors, or Boards of Water Commissioners in countiss where such organizstions are provided for rsgulating the distrihution of watere, to discharge thsir dnties according to the present laws.

But not to speculate upon what Legislatures may or can do in the future, so that ths greatest henefit from the use of water may he extended to the greatest number, the question naturally arises, how many of the present organizations in Kern county, or in the other counties in which similar laws exist, havs heen formed under sither or any of the laws rsferred to for the distrilution of watsr in such conntiss, or are opsrating in accordance with the provisions of thess laws? If thsy are not so organizsd, by what right do they claim the uss of watsr as against other users? For this is not a cass in which ths principle of "first in time first in right" prsvails, hnt whsre first in time, in compliancs with ths law provided for the subjsct matter in that county prevails.

The confusion and misunderstanding of the prinoiples which, in my opinion, govsrn the distrihution of waters for irrigating purposes in those countiss named in the Act of May 15, 1854, and kindrsd laws, arises from the supposition that any man could take watsr, whsrsvsr he might find it, for any purposs, provided he did not intsrfere with his nsighhor. This was ths common rnls in the mines, and whsn ths miners left the mountains to make homes for thsmselves and families in the vallsys, they naturally adopted ths sams rules thsy had learned in the mines, not knowing that diffsrent laws had bssn provided for rsgulating the uee of water in the valleys, where irrigation was and will heoome mors and more ssscntial as onr population increases. The two modes of regulating ths use of watsr ars necesssrily different, and Msxico, from whom we secured this tsrritory, has long been using hoth modes, ons for the mines and the othsr for agriculture, but never allowed the law for regulating watsr in ths mines, to opsrats where its uss was necessary for farming. Hsnce, ws notics that our lsgislators, as early as 1854, hy adopting the Mexican rules for irrigation, prohihited ths customs of the mines, in using the water courses, from gaining any foothold in the agricultural counties.

Bnt, as the principal husiness in early days in this Stats was mining, all the decisions of our courts relatsd to the nss of water in the mines, and not one can hs found which takss up and discusses the use and regulation of watsr for irrigation purposes in the agricultural counties under the Act of 1854, and kindred laws specially provided therefor in the counties namsd.

Prscedent is so powsrful a principle with our courts, that instead of recognizing the fact that it is as impossihls for ths cnstoms and lsws of minere, concerning the uss of water, to operats harmoniously with the irrigation law of 1854, in the same county, as it is for oil and water to unite; they are constantly trying to find eome analogoue principle in them governed hy these old decisions that will permit corporations or individuale, as firet appropriators, to control the water courses of the State, without recognizing the fact that this ie a growing State, and that the laws and the decisions mnst keep pace, to some extent, with the increasing wants of the people.

The sooner this water question is eettled hy legislation and legal construction on hroad and liheral principlee, which will keep the control of the water where it properly helongs, viz.: with the people, so that it can he distrihuted anywhere and at any time in proportion to the wants of the people, when they have provided the necessary ditches, canals and reservoirs to ntilize it economically, the hetter it will he for all. The laws on this suhject must be sufficiently elastic to meet the increasing wants of the people; and there wonld he no more sense in restricting the distrihution of water to the present usere than there would to pass a law that no one ehould he allowed to raise wheat in California except these at present, engaged in that business.

OPHIR CANYON.—A gentleman just in from Smoky valley informs the Eureka *Sentinel* that work has heen resumed on several old mining claims in the Toiyahe range, which were worked snccessfully eome ysars ago, hut had heen abandoned for a long time. The Ophir Canyon claim, recently hought for $20,000 hy an Eastern company, is heing worked by Lew. Hencherd with qnite a nnmher of men. He is also repairing the mill. The prospects in the works are good.

Economizing Labor in Mills.

Ths Grass Valley *Tidings* says: The Charonnat mine, at Canada Hill, is running steadily, and the ownere are eatisfied with the resnlt of their lahors. On this mine is one of the most complete mills of ths State, containing nearly all ths modern improvemsute and hnilt with a view to economizs in ths matter of lahor, and it is a success. The mill contains 10 stampe, which run day and night, 90 drops per minute, and thess etamps are fed hy automatic feeders that are simple and cheap in their construction, and do the work to psrfection. The ore hine will hold 60 or 70 tons and keep the feeders and batteriee constantly and evenly supplied. In the mill two men are employed. Ons of these breaks a sufficient quantity of rock by day to run the mill for 24 hours, and ths other attsnds to the four Frus concentrators and, at the same time, to amalgamation. They amalgamate in the hatteries and havs silver plates on the Frue concentrators which catch the gold that may sscape from the batteries. Ths mill is run hy steam, and is certainly a modsl in the way of cheapness and thoroughness of work. At the hoisting works the same amount of economy ie displayed as in the othsr portions of ths works. The hoisting works give employment to two men, ons hlacksmith, hy day only, and one engineer, who doss the hoisting, firing and attends to dumping the waste and qusrtz rock. The hlacksmith shop is in close proximity to the shaft. A patent hlower is ussd at the forge. Thus the hlacksmith doss all the drill-sharpening (ths drills are mads from three-fourth-inch steel), and he attends to the repairs of all othsr tools. The company, for all this work, only needs hie services during the day tims. At night one engineer is employed in the hoisting works, and one man to look aftsr the hatteries and concsntrators in the mill. These men constitute all the lahor required around the mill and hoisting works during the night. It is simply this manner of work which kesps the mine going and snahles it to yield monthly dividsnds to its owners. Ths supsrintendent informed us that wsrs it otbsrwise, the mine would havs to csase operations. The incline shaft is now down 660 ft., the hottom hsing vsry flat. Very good ore is heing hoisted from the lower crosscuts, and the prospects are that ths Charonnat mins will hs running and paying for years yet. It is estimated that milling the ore at this mine costs only $1.43 per ton. The total cost of raising, crushing, fuel, quicksilvsr and all sxpsnses psrtaining to sxtracting ths quartz is less than $8 psr ton. If there ie another 10 stamp mill in the State that can heat this for economy, we would like to hear of it.

Very Discouraging.

Ths hydraulic minsrs of ths Yuha river water-sheds gave pnhlic notice ahout two weeks ago that they would hold a convention in Nevada City on Saturday last, to make arrangemsnts for the huilding of a dam that would impound ths flow of howldere, dehris, stc., from the minee. Ths meeting was held and was vsry largsly attsnded, the deepest interest being taken in it hy all classes of people. Everything connected with it passed off in the most satisfactory manner, and prsliminary arrangemente were made to ths huilding of a dam on the Yuba river. Our peopls felt satisfisd that the trouble with the farmsrs would he of short duration, and peace would ones more he rsstored to them. Whsn the mail arrived on Saturday evening thsy were grsatly surprised to resd in the newspapers that the hoard of supervisors of Yuha county had, on ths day previous, held a meeting and passed resolutione instructing ths District Attornsy of that county to commence suits immsdiatsly against all companies who are smptying their dehris into ths Yuha river or any of its trihntaries. They also appropriated $3,000 to smploy assistant counsel, and have secured the eervices of Senator Davis, of Ynha, and James Bayne, of Colusa. A general gloom was cast over the community, and great indignation was manifested hy all classes of people who were in Nevada City from varions parts of this and adjoining cout'ee. The miners of Nevada conuty ehow a disposition to do all in their power to avert further damage to the lower country, and on the other hand, the grangers do everything that within them lies to thwart and annoy them. The conduct of the eupervisors is diegraceful, and we believe that when the people of the State come to know the full facts of the case, they will concnr with ns and say that such ungrateful men are nnworthy of any assistance or sympathy. If the miners continued to work their claime without taking any steps to stop the flow of dehris to the lower country, then there might he some excuse for the grangers to rush pell-mell into the courts and ask for a restraining order; hut when the minere are making arrangements as fast as possihle to comply with Jndge Temple'e decision, it is a moet outrageone act to commence new suits against them. If the grangere will allow the minere to build the dams, the trouhle will soon he at an end; hut we are afraid that so long as the farmere are led on hy senseleee men there will he no end to it.—*Nevada Transcript.*

ANOTHER MILL.—There is a strong prohability that a quartz mill will he erected eight miles from Bridgeport within the next 90 days. The *Union*, which gives this newe, fails to indicate the precise location of this mill.

MECHANICAL PROGRESS.

Wrought Iron Philosophically Considered.

Dr. Anderson, in his lecture on "Tools," lately delivered in Manchester, England, said: When we think of any sort of material, beyond the working treatment of their mechanical properties, we seem to be in another world. Take, for example, a piece of common wrought iron. It seems to us as of the earth earthy; but, if we are closely questioned in regard to the reason for its various properties, we find that we scarcely know anything. Tracing it from the ore through its various stages until it is in the hands of the smith, is comparatively easy. We know the natural law that governs its elasticity, the limit of its elasticity, its ultimate strength; that it can be welded; that it is ductile, and can be drawn out into a fine wire, that it is malleable, and can be spread out into a sheet, or worked round from the sheet into a goblet, and may be gathered back again, if by so doing it served any useful purpose; but when we think of the marvelous changes which have taken place amongst its molecules during the operation, we are lost in wonderland. To many minds, the piece of cold iron seems to be a solid; under the pressure of the testing machine, it is shown to be an unstable fluid. When the smith has the misfortune to leave a piece too long in the fire, it vanishes; it has found evil companions, and gone off under an assumed name and a new character. When a piece of iron is broken and carefully examined under a microscope, we can see that it is composed of fine crystals; but these crystals, we are told, are composed of innumerable molecules, which are not to be seen by the microscope, being smaller than the human mind can imagine; still, the smith feels himself under their influence. In homely words, he speaks of the iron being "red-short" or "cold-short," without thinking that he is on the threshold of some of the impenetrable secrets of nature. The steel-maker can take advantage of the molecular properties. With heat he can push them asunder and infuse amongst them the subtle vapor of carbon, and the iron becomes steel, highly improved in most of its mechanical properties, and with an increase of strength and elasticity. It may be inferred that each iron molecule is a little world in itself, surrounded with a thin wrapping of infinite space, no single molecule being in actual contact with any other molecule. We have reached the limit of sub-division, so far as the engineer dare venture. The investigating philosopher, however, ventures much further with his speculations; he tries vainly to penetrate into the supposed ultimate atoms of matter of which the molecules are composed, but further we need not follow. Suffice to say, that a piece of common wrought iron is altogether a mystery, and teaches man the lesson of humility.

Mechanics.

If young mechanics, as a rule, would fully realize their own usefulness, and assert their own individuality, others would feel the benefit of their awakening as well as themselves. There is no class of the community upon whom the welfare of the country more essentially depends than upon the rising generation of young mechanics. If they are intelligent, sober, industrious, and consequently independent, able and accustomed to judge for themselves, and governed in their conduct by an enlightened view of their own best interests; if they are men of this sort, the mechanics, and especially the young mechanics, will form, in conjunction with the young farmers of the country, a bulwark against monopolies and corrupt politicians, and save the republic. If, on the other hand, they are ignorant, idle, dissolute and, consequently, poor and dependent upon those who are willing to trust them—if our mechanics should unhappily become such a class—they would soon be converted into the mere tools of a few rich and artful men, who, having first stripped them of every sense of self-respect and every feeling proper to virtuous citizens, would use them as passive instruments for promoting their own ambitious objects, and for the enactment of laws which are beneficial to nobody but the few artful and base demagogues with whom they originate. It is as true of the mechanical arts as of any other profession, that "knowledge is power."

BAND SAWS VS. CIRCULAR SAWS.—The German industrial papers are discussing the question of the disadvantages of circular saws as compared with band saws: 1st. Circular saws are very dangerous to the workmen. 2d. They require a much greater power to drive them than any other kind. 3d. They make a much wider cut, producing more waste, and thus fewer products from a given amount of material. The only advantage is that the cost of procuring a circular saw is less than that of a hand saw; but, notwithstanding, the Mechanics' Association (*Gewerbverein*), of Muehlhausen, have already published in their yearly report the advice to abolish their use wherever it is practically possible to do so; and this is of course the case in the great majority of circumstances.

THE friction of a belt is claimed to be double as much on wood as it is on iron.

Facts in Mechanical Construction.

You rise in the morning and, while dressing, take up a phial containing a tonic, of which a little has been prescribed for you; but, after the first few drops have been counted, succeeding drops run down the side of the phial—all because the lip is shaped without regard to the requirement. Yet millions of such phials are annually made by glass-makers, and sent out by thousands of druggists; so small being the amount of sense brought to bear on business. Now, turning to the looking-glass, you find that, if not of the best make, it fails to preserve the attitude in which you put it; or, if what is called a "box" looking-glass, you see that the maintenance of its position is insured by an expensive appliance that would have been superfluous had a little reason been used. Were the adjustment such that the center of gravity of the glass came in the line joining the points of support (which would be quite as easy an adjustment), the glass would remain steady in whatever attitude you gave it. Yet, year after year, tens of thousands of looking-glasses are made without regard to so simple a need. Presently you go down to breakfast, and taking some Harvey or other sauce with your fish, find the bottle has a defect like that which you found in the phial; it is sticky from the drops which trickle down and occasionally stain the table-cloth. Here are other groups of traders, similarly so economical of thought that they do nothing to rectify this obvious inconvenience. Having breakfasted, you take up the paper and, before sitting down, wish to put some coal on the fire. But the lump you seize with the tongs slips out of them, and if large, you make several attempts before you succeed in lifting it—all because the ends of the tongs are smooth. Makers and venders of fire-irons go on, generation after generation, without meeting this evil by the simple remedy of giving to these smooth ends some projecting points, or even roughening them by a few hurrs with a chisel. Having at length grasped the lump and put it on the fire, you begin to read; but before you have got through the first column, you are reminded, by the changes of position which your sensations prompt, that men still fail to make easy chairs. —*Popular Science Monthly.*

UNIFORM MOTION.—It is always desirable that the motion of a machine should be regular. Even supposing that the first mover is perfectly constant and equable in its action, the machine may not be regular in its movements, from the irregularity of the resistance to be overcome. But still, if both the power and the resistance were perfectly regular, the machine would not be perfectly uniform in its motion, for there are particular positions in which the moving parts of a machine are more efficacious than others, as in the crank, for instance; hence the energy of the first mover will be unequally transmitted, and irregularity in the motion of the machine will consequently follow. The motion of some machines bears a constant tendency to accelerate, others to retard; and, perhaps, in no case whatever can the motion of a machine be said to be perfectly uniform, but common sense will point out the necessity of having the motion as uniform as it can be made, else it will increase in proportion as it is multiplied through the machinery.

NEW STYLES FOR FINISHING.—The fact is observed by hard-wood manufacturers that new styles are being adopted in the direction of fine finishing, the most of which are somewhat antique. In fact, while they mark a new departure as compared with the recent types of finishing, they still partake of the characteristics of the styles of years ago; that is, while they are new, they are at the same time more or less old-fashioned. Perhaps it is with architecture as it is with fashions, for with the advent of knee-breeches and the prospective recurrence of the balloon style of ladies' dresses, we may soon find ourselves back to the good old times when our forefathers first ascertained that America was a great timber country, and wore powdered wigs.

IMPROVEMENTS IN WATCH MAKING.—Some 40 years ago the majority of watch carriers (and they were few then compared to the present time) were well satisfied with their timepieces if they did not vary over five minutes a day, and one that would time closer than that was considered a valuable piece of property; but since then the demand for a better grade has increased, and American enterprise and genius have gone to work and are now producing time-keepers, both watches and clocks, that are but little outside of perfection.

A SEAMLESS SHIP.—Some time since it was proposed by a mechanic in Philadelphia to build steamships of one solid piece of iron or steel, without seam or joint. This he was to accomplish by welding the plates and frame, instead of using bolts or rivets. He claims that he has invented machinery by which the thing can be done, at a great saving of cost, of weight and of time, and with a great gain of strength and durability.

IRIDIUM is many times harder than the hardest steel, and will not rust or corrode in any atmosphere or fluid. The only means of cutting iridium is by friction with a soft metal wheel, charged with diamond dust or fine corundum.

GALVANIZED IRON will corrode after six or seven years' exposure to moisture.

SCIENTIFIC PROGRESS.

How Fish Find Their Own Rivers.

The long-held and only recently-rejected theory, that the shoals of fishes move in a vast mass along the coast, sending off detachments into each river as they passed its mouth, is to be attributed to John Gilpin and some other authors, who have written flowingly on the subject. The recent careful investigations of naturalists, indicate that the fishes, entering the rivers and bodies of fresh water from the sea, do not have an extended range in the ocean, and that each river's colony remains, after returning, in the deep waters opposite their river.

The motive for the movement of these shoals of such fishes, or rather how it is incited, has scarcely been explained. The life of the fishes has always been a mystery. It is not a search for food, as they do not eat while in fresh water; the opening of hundreds of stomachs will fail to find food present. It is an easy disposal of the question as to how each colony recognizes its native river, to say that "it is instinctive." So it is, also, when the butcher's horse recognizes the familiar gates; but we have some evidence as to what senses he uses. The fishes, probably, prompted by functional disturbance, from the tumid ovaries and spermaries, are incited to movement.

The courses of the sea, unmarked as they are, are within each colony's limit, their habitual pathways. An unerring capacity in the fish for finding its own river may be more than that which guides the hermit-crab to the shell of the *nautica*. The latter goes to hide its sensitive body, with an apparent nervous trepidation at its unprotected condition. The former, with an uneasiness of body from the functional changes it is undergoing, is impelled to activity. The transmitted habit of ascending the stream is, as it were, blended and alloyed with the substance of the nerves, and aroused by its condition, carries it, without conscious purpose, into the river of its progenitors and its own. The impulses of the fish are only in a slightly more complicated series than those of the crab. That it should be the instinct for a specific stream, established through inheritance of many generations, is easier to understand than that it is a sort of memory of the place of its immature life, as the theory of fish culture makes it, and as observation seems to sustain.

In the waters of the Delaware, where there were no salmon originally, the young salmon placed in Bushkill creek returned after five years, and were taken, not only in the Delaware river, but the larger number in the neighborhood of Bushkill creek. It is not essential that all the fishes should have this impelling influence, whatever it may be, as like gregarious mammals and birds they flock together, following the leadership of whichever for the time takes it. The idea is suggested that the senses may be the guiding agent, that a fish goes nosing along the coast, or tasting the streams, until it recognizes its own. The convexity of the cornea must afford the fishes a very limited range of vision. The supposed dullness of the sense of smell and of taste in fishes might alone dispose of the suggestion that these are employed.

The following occurrence, however, would seem to decide to the contrary. The Russian river, emptying into the Pacific, north of San Francisco, had its mouth entirely closed by the waves during a storm. The colony of salmon made their yearly migration from the deep waters toward the mouth of the river, and many of them raced through the surf, and landed high and dry on the sand that walled them out from their native river.

The migration of the salmon into some of the Pacific rivers is a frenzied advance over shoals, rapids and cascades, far into thin streams and brooks, where they arrive battered and weary, to accomplish their exhaustive reproductive labors, and drop back, the sport of the currant, dead and dying, toward the sea.—*Harper's Magazine.*

SILICATED CARBON FILTERS.—Professor Wanklyn has, it would appear, been conducting a series of exhaustive experiments, which have, off and on, extended over some years, with the object of ascertaining the peculiar action of "silicated carbon" as a filtering medium. The results of his investigations we find detailed in a paper on filtration, lately read by him at the Sheffield meeting of the British Medical Association. The one broad fact arrived at is that silicated carbon possesses, in a high degree, the property of decomposing nitrogenous and organic matters, and this, though they be contained in very dilute or comparatively strong solutions. Water containing nitrogenous matter, animal secretions and excreta, as milk and urine, greatly diluted, with solutions of quinine, morphia and strychnine, were, among other liquids, made to pass through the filtering material and with striking results. In the case of the quinine and strychnine experiments, 8¼ and 8⅜ grains respectively of these intensely bitter alkaloids were dissolved, each in one gallon of water, and after filtration of the solution they were found to be devoid of bitterness, a striking proof of the thorough decomposing or eliminating action of the material. The careful investigations of Prof. Wanklyn establish the reputation of the silicated carbon filters on a yet surer basis, and point to their complete trustworthiness among much that is untrustworthy in the way of filters.

ARCHITECTURE OF ANIMAL LIFE.—The architecture of animal life is infinitely more marvelous, and oftentimes more beautiful, than the most gorgeous edifices reared by the hand of man. We look with astonishment—if we think while we look—on the temples and palaces and gigantic constructions of every kind, which his skill, his intelligence and his industry have raised; on the wide-swelling dome, be it of stone or glass; on the graceful, tapering spire, boldly shooting upwards into the sky; on clustering columns; on ponderous arches, whose shoulders might sustain a mountain. We see stone compactly and symmetrically fitted to stone, each of its appointed size and in its appointed place, while the chisel of the sculptor enriches them with cunning workmanship, and transforms the shapeless blocks into elegant proportions, and puts on them the undying impress of beauty; weaving out of stone and marble garlands of flowers and types of all things lovely, such as those with which the Deity himself has adorned the great temple of nature—the visible world of His own creation. All these are the works of reasoning, educated man, who builds according to rules and laws which science teaches. But if we pass from them to the structures of the lower creation—the "homes" made "without hands"—we see far more reason for wonder in what instinct alone has taught the bee and the ant, the reptile and the bird, to form, each for its own purposes of safety and domestic comfort.—*Art Journal.*

SCIENTIFIC PARADOXES.—The water which drowns us can be walked upon as ice. The bullet which, fired from a musket, carries death will be harmless if ground to dust before being fired. A crystallized part of the oil of roses, so graceful in its fragrance, a solid at ordinary temperatures, though readily volatile, is a compound substance, containing exactly the same elements, and exactly the same proportions, as the gas with which we light our streets. The tea which we daily drink, with benefit and pleasure, produces palpitations, nervous tremblings, and even paralysis, if taken in excess; yet the peculiar organic agent called "theine," to which tea owes its qualities, may be taken by itself (as theine, not tea) without any appreciable effect. The water which will allay our burning thirst augments it when congealed into snow, so that Captain Ross declares the natives of the Arctic regions "prefer enduring the utmost extremity of thirst rather than attempt to remove it by eating snow." Yet if the snow be melted, it becomes drinkable water. Nevertheless, although if melted before entering the mouth it assuages thirst like other water; when melted in the mouth it has the opposite effect. To render this paradox more striking, we have only to remember that ice, which melts more slowly in the mouth, is very efficient in allaying thirst.

HOW THE DIAMOND CUTS GLASS.—Dr. Wallaston ascertained that the parts of the glass to which the diamond is applied are forced asunder, as by a wedge, to a most minute distance, without being removed; so that a superficial continuous crack is made from one end of the intended cut to the other. After this, any small force applied to one extremity is sufficient to extend this crack through all the whole substance and across the glass; for, since the strain at each instant in the progress of the cruck is confined nearly to a mathematical point at the bottom of the fissure, the effort necessary for carrying it through is proportionally small. Dr. Wallaston found by trial that the cut caused by the mere passage of the diamond need not penetrate so much as the two-hundredth part of an inch. He found, also, that other mineral bodies, recently ground into the same form, are capable of cutting glass; but they cannot long retain that power, from want of the requisite hardness.

SOUNDS PRODUCED BY THE EFFECTS OF JETS ON DIAPHRAGMS.—It was discovered in 1826 by a French engineer, that when a plate was held normal to the axis of a jet issuing from an orifice under pressure, and at a certain hight above the jet, it was repelled, whereas if held lower, it was attracted. It was also found that there was a neutral point at which the plate was supported on the jet, and emitted an audible note as it oscillated about this position of equilibrium. It may not be without interest in this connection, to state that M. Th. Vautier has recently succeeded in evoking very high sounds in this manner, and registering them. With a jet of steam having a pressure in the boiler of 4½ atmospheres, and issuing from an orifice about 1 inch in diameter, against a plate ¼ inch in diameter and .06 inch thick, held .007 inch from the orifice, a sharp note was obtained, the number of vibrations per second being about 7,250.

THE range of the human eye may be judged of from a consideration which gives us at the same time a good idea of the scope of animal structure. Supposing that an individual of every known species were to take its stand between the two species that were respectively the next larger and the next smaller than itself, the smallest known animal at one extremity of the line, and the largest standing at the other; and then supposing we were to ask which creature occupied the middle place, having as many degrees of size below it as above, that place would be found to be occupied by the common housefly. What stupendous optical instrument must that he which, assisted with a few brass tubes and some disks of glass, shall discern a creature as much smaller than a fly as a fly is smaller than an elephant?

The Mining Share Market

Although there has been no special movement in the share market, which may be considered lively, the Virginia *Enterprise* thinks there is, here as well as in the Comstock, a growing feeling that a fertile and productive zone is about to be entered at the north end of the Comstock in the Mexican, Union Con. and Sierra Nevada mines. All the recent workings at and below the 2700 level are so showing as to sustain this view. Not only does the quartz at every point show metal, but it is also seen that the proportion of quartz is steadily increasing. Thus it is found that there is a great deal more quartz on the 2900 than there was on the 2700 level, though but small sections of the 2900 level have been explored. During the past week much quartz, all carrying metal, has made its appearance in the south drift of the Union on the 2900 level, and it is now looking even better than the joint Union and Sierra Nevada west crosscut, in which many streaks of low-grade ore have been cut during the past three weeks.

An excellent indication is seen in winze No. 1, on the 2700 level of the Mexican, where it is found that the dip usually seen in nearly all ore deposits on the Comstock has changed, and instead of being strongly to the east, has now become vertical. This change has long been desired in the north end mines, where, for the last 400 to 500 ft., there has been a great expansion in the vein, which had a tendency to scatter the mineral through a great area of vein material. The straightening up of the east wall will tend to compress the vein. That there is such a straightening up is seen not only in No. 1 winze, on the 2700 level of the Mexican, but also at several other points on the lower levels in going ont toward the east side of the vein. The east wall itself has not yet been reached, but the stratification of the material filling the channel of the vein gives notice of its position, and shows that it is changing toward the vertical.

At the Union, a drift that is being run south from the 2600 stopes, has out and is still cutting through bunches of good ore. These are not a part of the ore deposit of the stopes, but seem to be the continuation of a southeast deposit that was cut some months ago on the 2500 level, and very little explored. At this point a valuable deposit of ore may yet be found. The raise from the 2700 level is still cutting bunches and stringers of ore, though it is going up to the west of the main deposit, as supposed.

At the Best and Belcher they will soon be again engaged in active prospecting, and in very promising ground.

At the middle mines they are awaiting the work that is in progress at the Chollar-Norcross-Savage shaft.

The Yellow Jacket folks are beginning to get some ore from their old upper levels, and at the Crown Point and Belcher they are taking out about 200 tons per day of good milling ore.

The Alta folks expect to be in a position to resume pumping in about two weeks.

Work has been commenced on the mammoth lead works, to be erected at Germania, Utah. The Germania lead works will be ready for manufacturing white lead within the next 60 or 70 days. As soon as the company get their works in operation, they will also enter into the manufactnre of sheet lead, lead pipe, and in time, will come the shot-tower.

Copper Smelting.

Superintendent's Office,
Old Globe Copper Co.,
Globe, Arizona, July 26, 1882.

Editors Press:—In your issue of July 15th, you give an account of the run of our furnace for the week ending July 6th, stating that the furnace was made by Rankin, Brayton & Co., of the Pacific Iron Works. Permit me to add that the water-jacket furnace here was constructed, and is operated, under my own personal supervision, and the run for the campaign ending July 8th, when the furnace was closed down for lack of coke, is as follows:

Date.	Lbs. ore smelted.	Lbs. Bullion produced.
June 22	71,750	14,693
June 23	91,500	17,613
June 24	87,000	17,996
June 25	96 300	17,279
June 26	97,800	20,927
June 27	91,200	18 320
June 28	88,500	19,800
June 29	90,600	17,254
June 30	100,500	20 373
July 1	90,300	21,098
July 2	82,800	16,378
July 3	81,000	13,877
July 4	85,200	16,747
July 5	90,000	15,557
July 6	76,500	15,619
July 7	83,700	13,848
July 8	82,500	16,253
Totals	1,487,150	203 532
Average per day	87,479	17,266

The furnace was again fired up on the 19th inst., the resnlt for the week ending at 7 o'clock this morning being as follows:

Date.	Lbs. ore smelted.	Lbs. Bullion produced.
July 19	85,350	12,030
July 20	75,500	13,430
July 21	99,300	17,850
July 22	75,300	16,240
July 23	75,550	19,255
July 24	82 225	18,275
July 25	83,200	17,575
Totals	567,425	114,655
Average per day	81,060	16,379

These figures, I think, eclipse anything in the shape of a single furnace's prodnct on this coast. The ore used is entirely from the Old Globe mine, and is self-fluxing. Respectfully,

J. J. Williams, of Bisbee, Williams & Co.

Harmon Seminary.—On Thursday evening a reception announcing the completion of the Harmon Seminary was held in the new Seminary building in Berkeley. The beautiful rooms were thronged with the friends of education and lovers of good music. The Orchestral Union of San Francisco rendered several fine selections. Addresses, expressive of good will to the new institntion for the edocation of young ladies, were delivered by President Reid and Prof. Kellogg, of the State University, Rev. Dr. Brook, Rev. Mr. Pond and others. The school opens this week, and many girls are arriving from the interior of the State and from beyond, and others will be received later and assigned to the classes for which they are prepared. The school will be an excellent place to give girls and young ladies the best there is in boarding school life and studies.

The Empire mine, Tombstone, is turning into a veritable honanza, and from present appearances is second to none in the district. The stope in the 450 level has turned into a huge body of horn silver bearing mineral, and the 400 level is ahont in the same condition. More than 5,000 tons of extremely high grade ore is said to be now in sight, assaying from a general sample $211 in gold and $373.31 in silver,

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

BUTTE.

Kentuck Mine.—Croville *Mercury*, July 27: The Kentuck mine, owned by Billingsly & Halsey, situated upon French creek, below the mouth of Peavine, has been, and at the present time, is yielding well. It is a portion of a large flat some 3 miles long and from 100 yards to a quarter of a mile wide—the Kentuck being the upper claim, comprising 100 acres, with two companies below. An insufficiency of grade prevents fast working of this flat, and it is, therefore, one of the most lasting of mining properties. From 10 to 15 ft of red earth overlies the gravel, which is sluiced off in the winter to the gravel stratum, which is from 3 to 4 ft deep. Necessarily, the latter has to be shoveled into sluices with light grade, and consequently, all of the coarser gravel and small cobbles have to be forked out. In consequence of this Billingsly & Halsey do their own work, and their wages rate at $5 to $6 each a day for the entire year. Connected with the Kentuck is a ditch about three-fourths of mile long, bringing the water from French creek to the mine, of a capacity of about 300 inches, delivered at a bight of perhaps 40 ft above the bedrock. The gold is fine, in both character and quality, and upon the bedrock prospects of 50 cents and $1 to the pan are not uncommon. This entire flat seems to be nearly uniform in depth and yield, and were the ownership combined, so as to enable work to be commenced at the lower end, could be washed much faster than by the present method of working. But, even as it is, its great extent would consume many years in working. It is one of the certain and lasting pieces of mining ground of Butte county.

CALAVERAS.

Will Soon be Put Up.—Calaveras *Chronicle*, July 20: The company owning the Chicago & Rock Island quartz mine, at Independence, near Railroad Flat, has let the contract for furnishing and putting up a mill on their mine to W. V. Clark, Esq., of Railroad Flat. We are informed that Mr. Clark has purchased all the machinery complete for a mill, and that all of it will be on the ground ready to be put up by the latter part of next week. The timbers and other lumber will soon be supplied and the work of construction commenced and rapidly pushed to completion. We have the information from a competent judge of such things, that the mill, when put up, will be first-class in every respect.

Water Out.—By the fore part of this week all the water in the Coral Flat mine had been pumped out and the mine entered. The works were found to be in good condition. There is very little mud in it, and, consequently, it will take but little work to put things in order for taking out gravel. The water was pumped out in a comparatively short time, in a much less time, in fact, than it was anticipated it would take. Work in the mine has not yet commenced. Some repairs in the hoisting works are to be made before operations are begun.

EL DORADO.

Rich.—Georgetown *Gazette*, July 27: The Rich Gulch seam mine, near town, owned by T. Z. Armstrong & Baldwin, from which they took out about $24,000 last May, has been yielding an average of $20 per day ever since, for two mens' work. Mr. Baldwin retired to his Calistoga home about the 1st of June, leasing his one-half interest to Mr. S. C. Adams, whom we are pleased to see is doing so well.

The mining outlook in the vicinity of Garden Valley is very promising. The Rosecrans, which has been idle for some months, has just been pumped out, and we expect to see the mill running soon. This is generally considered a good paying mine, but we have never been able to learn what the rock is yielding. The old Taylor mine is receiving the attention of parties from San Francisco this week, as are also the Esperanza and Bell mines. Garden Valley is destined to enjoy quite an increase in business before long.

MARIPOSA.

Dilz Mine.—Mariposa *Gazette*, July 29: In the event the present negotiations of sale fall through after November 4th the captain will commence work upon the tunnel already begun, which, when completed, will be 1,500 ft in length and give a lift or backing of 445 ft. upon the vein. A 10-stamp mill is first contemplated to be built at the mouth of the new tunnel, which faces the road. This mill will be supplied with ore as the tunnel progresses upon the vein, which is in line with the tunnel. Also, according to plan, another 10-stamp mill, to be run by water power, is to be built at the falls of Sherlock's creek, a short distance from the mine, which will afford water power for six months of the year or thereabouts.

New Discovery.—*Herald*, July 28: Mr. Wm. Conneff, of Sherlocks, is reported to have discovered what promises to be a bonanza, on the head of what is known as the McCann gulch. It was always supposed that there was a rich vein in that vicinity, and a great deal of prospecting has been done in search of it.

NEVADA.

Good Diggings.—Grass Valley *Union*, July 27: Messrs. Bagley & Huntress have struck good pay gravel in the diggings in the bed of Deer creek. Six Chinamen are employed in the diggings, and are kept constantly at work wheeling and shoveling the rich gravel into sluice boxes. A 17-ft overshot water wheel is used in pumping water from the claim, and the gravel is hoisted by a derrick. In washing a pan of gravel from this claim, it is said the bottom of the pan is left covered with gold.

PLACER.

Quartz.—Placer *Argus*, July 27: The Daniel Webster quartz mine, 1½ miles from Michigan Bluff, is being prospected. The ledge at the surface is about 18 inches thick. One shaft has been sunk 50 ft, and another is being commenced. The rock worked has paid well.....At the Weeks Con. drifting mine, about 75 men are said to be employed, and the mine is paying well.....At Baker's Divide a lower tunnel is being run.....From Iowa Hill we learn that prospecting on ledges in Snail canyon bids fair to develop some rich quartz mines. It is very possible that before long that district will prove to be as rich in its quartz mines as it has been in its gravel mines..... Peisten's mill, on North Ravine, has been running during the past month on custom rock from several mines in that vicinity.....A rich strike is reported in the Athens mine, near town. A chuts of excellent milling rock is being opened up.....At the Mina-Rika quartz mine the pay chutes still hold out. Their workings are getting below the water-level, and first-class hoisting and pumping machinery will soon be put up.....Some rich rock has lately been taken out of the Rocky Ridge quartz mine, on North Ravine, and we understand it is the intention of the owners to prospect and open up their property thoroughly in the near future.....The Gold Blossom has been running this week, and the result has been satisfactory. Rotary screens will be placed in position next week, to better facilitate the saving of fine sulphurets. .....The Pioneer mill is running on Belvoir rock. The mine is still holding its own in ore production, although work in the drift has been temporarily suspended, while hoisting works on the new main shaft are being built.

Strike.—We have to record another rich strike in the Shurtleff mine. During the past week, candle boxes of rock that will contain from $1,500 to $2,000 each have been taken out. The main ore chute, for which Mr. Shurtleff has been running a 700-ft tunnel, has been struck, and the result is such as to justify him in his faith in the mine.....The Morning Star is running a north and south drift from the 260-ft level. The ore body is fine and full of free gold, with very little sulphurets. They will start up their mill in a few days, as 80 tons of fine ore are now on the dump waiting to be put through. .....Frank Pollow made a clean up of 80 tons of ore this

week, from a ledge he has been prospecting, with gratifying success. They will now sink a large working shaft.

PLUMAS.

COPPER MINE.—Greenville *Bulletin*, July 27: On last Thursday, in company with Mr. Williams, a visit was made to the copper mines in Light's canyon. At the Bullion mine a good deal of work has been done since it was last visited; the ledge has been uncovered for a long distance on the surface; a tunnel has been run across the ledge 32 ft without yet reaching the hanging wall; the ore gets richer as the tunnel penetrates the vein. During our stay two blasts were exploded, and, with each, very handsome ore was thrown out; the various shades of color in the ore are really beautiful, specimens from this mine are eagerly sought after for cabinets. The extent of this ore body is immense, and the evidence of silver being present in paying quantity continually improves.

SOUTHERN EUREKA MINE.—A fresh complication has arisen in connection with this mine. Last year a new ledge was found, on which considerable work has been done by other parties, who are still at work upon it. Mr. Leavitt, who lately came here from New York, as the representative of a company who have leased the mine, claims that this ledge is on the ground belonging to the Southern Eureka Co., and is included in the property leased by them to his company. On Monday morning he gave verbal notice to the parties at work on the ledge to stop all further operations, otherwise action would be taken against them as trespassers. This notice they have refused to obey, alleging that Mr. Scott, on the part of the Southern Eureka Co., refused to accept or locate the ledge, and that then the location was made by the present holders. Proceedings will at once be begun to determine the ownership of the claim.

MONITOR MINE. Some rich developments have been made at the Monitor during the past few weeks; a body of ore is now opened that assays into the hundreds; the ore is very spongy and rusty looking, taking a piece of it in one's hand gold can be shaken out of the pores. The rock is very rich in sulphurets, and by the ordinary milling process much of the gold will be lost, concentrators would be of essential service in working this ore; in fact, it is a well-established opinion that all the ore in the Greenville district ought to be worked by concentrators.

SHASTA.

EXAMINING.—Shasta *Courier*, July 29: George Heart and Archie Borland went below last Saturday morning after making a 2 weeks' examination of the Camden, Magee & Co. mines on Iron mountain. Their reappearance here will mean business. They are well pleased with the mine.

SIERRA.

SINKING.—*Mountain Messenger*, July 27: Haskel Peak Co., above Sierra City, is now sinking a shaft in its tunnel, and is down 40 ft in fine looking washed gravel. Three hundred ft back they found bedrock, and a prospect at a depth of 60 ft.

SOME RICH QUARTZ.—Sierra *Tribune*, July 21: A reporter of the *Tribune* visited the quartz ledges recently discovered by Messrs. Way & Bonham, and which are situated 1¼ miles southeast of the Keystone mine, and 12 miles from Forest City. These ledges seem to be true fissure veins, and are encompassed by well-defined hanging and footwalls in porphyry and slate. Ons of the ledges has been sunk to the depth of 20 ft, and the other to the depth of some 15 ft, each carrying free gold so far as developed. The latter ledge has been cut in several places and gold found to exist, which would indicate that they were well defined and profitable veins. Water can be procured at little expense, and the owners propose to put up a mill on their property as soon as possible.

TRINITY.

WORK DONE.—Trinity *Journal*, July 29: Miners in Weaver basin, and some at outside points, have completed their season's labors and are now enjoying a loafing spell. Although the mining season has been a very poor one, owing to lack of water, it has resulted in the payment of all expenses, and, in some instances, leaving a fair margin for profit. If the prayers of the wicked availed, or there was reasonable promise that they might, we should commence at once to pray for more rain next winter.

NUGGETS.—In passing by the Gregon Gulch Mountain mine the other day Supt. Loveridge permitted us to feast our eyes upon some of the coarse gold they are now taking out of the mine in the process of cleaning up. Several pieces we noticed would weigh over an ounce each, and the largest probably not less than $40. Hope they may get many more of the same kind. The claim is now in splendid shape for working, and another season, with a good supply of water, bids fair to make a big showing.

THE BRUNSWICK MINE.—Mr. Luke McDonald, superintendent of the Brunswick M. & M. Co., was in town this week, and tells us that work is progressing very favorably, the tunnel now being in a distance of 95 ft, and in very soft rock. It is expected that the lode will be tapped in running a little more than 100 ft further, and, should it develop as favorably as at the depth of the shaft—65 ft—it will take rank as the best mine in the district.

MORE RICH QUARTZ.—The mountains in the vicinity of Deadwood are said to be full of prospectors, and new ledges are being found which promise well. Mr. R. R. Shiplar recently discovered one from which he obtained rock going as high as $1 per lb. The seams are narrow, but give promise of uniting and forming an extensive as well as rich lode. We also learn that recent discoveries on Eastman's gulch, in the vicinity of Baker & Hickey's ledge, prospect remarkably well. Quartz interests in Trinity county are looking very bright at present.

TUOLUMNE.

PATTERSON MINE.—Tuolumne *Independent*, July 29: The Patterson mine, at Tuttletown, is working most vigorously. The main shaft, or No. 2, is being sunk by contract. The dimensions are 10 ft long and 6 ft wide, outside measurement; all most securely timbered, and hoisting is operated by powerful double-action, compound hydraulic engines—motive power being one of Knight's high-pressure wheels 4 ft 6 inches, water being conducted through 11-inch pipes from a large reservoir on the surface of the mine that has a containing capacity of 300,000 gallons, at an altitude of 120 ft. The shaft is now down about 200 ft, and sinking will be continued for several hundred ft deeper. The stations will be cut and opened up every 100 ft, and driven north and south to tap the ore bodies in cbutes that exist on each side of the main shaft. Winzes are also being sunk to connect with the next lowest level, to meet the drifts that will be run from No. 2 station. The main shaft and hoisting works are situated in a lofty chamber cut out of the solid rock in the adit level, some 400 ft from mouth of tunnel and some 100 ft from the surface. Gold is showing quite freely from winze on No. 1 level, or the 130 ft south. The ore house is being rapidly filled, and a good deal of quartz is accumulating in some of the levels. The company is putting up a first-class mill, which, when fully completed, will be 40 stamps. When 10 are erected, it is proposed to start up, and gradually increase till the full complement is reached, if the supply of ore demends such. The power is given by a 6-ft Knigbt's wheel. Water is conducted through 11-inch pipes from the same reservoir as hoisting works, having an altitude of 180 ft. Concentrators and pans will be added to make this mill the most efficient gold-saver in the State. The mill and surroundings are being constructed by Mr. Murray, the engineer, from Sutter Creek—a most skillful and competent gentleman. It is expected that a mill of 10 stamps will be ready to start up in 3 weeks, and will be kept continuously running on good payable rock. The present outlook for this enterprising company is second to none. There is no doubt but that it is a most valuable property, and by systematical and economical management, success is foreshedowed. The whole of the works are under the menagement of the company's superintendent.

[In addition to the above we are informed by a correspondent that the gold ore struck in the main sbaft (No. 2) is worth $10 to $12 per ton. The "gouge" prospects from $7 per ton, all free gold. The shaft is nearly 200 ft deep. The edge of the ore chute having been touched, the prospects are most flattering.—EDS. PRESS.]

NEVADA.

WASHOE DISTRICT.

COM. VIRGINIA.—*Enterprise*, July 23: South drift No. 2, on the 2500 level, has been advanced 21 ft. Are still cutting out a drain and retimbering in the joint California east drift on the 2700 level.

CALIFORNIA.—Are still engaged in cutting out a drain and retimbering the joint Con. Virginia east drift on the 2700 level. Ore is still being extracted from the old croppings.

SIERRA NEVADA.—On the 2700 level are cutting out a station in No. 2 winze. North lateral drift on the 2700 level has been extended 20 ft. On the 2900 level the joint Union Con. west crosscut has been extended 20 ft.

OPHIR.—On the 2700 level are enlarging the station in the joint Mexican winze to make room for blowers and fans. Are extracting ore from the croppings.

MEXICAN.—Crosscut No. 2, on the 2700 level has been extended 33 ft. Winze No. 1 has been sunk 6 ft, the bottom showing some fair milling ore. Are enlarging the station in the joint Ophir winze to make room for fans and blowers. On the 2900 level the joint Ophir winze has been sunk 10 ft, and the northeast drift extended 30 ft.

UNION CON.—On the 2600 level are stoping out ore. The southeast drift has been extended 23 ft. During the week 423 tons of ore have been extracted, and 334 tons and 1856 lbs. sent to the mills.

YELLOW JACKET.—There has been no change in the state of the water in the mine; it is still stationary at a point 443 ft above the 2100 level station. At the Winters shaft the west cross-drift on sagebrush level has been run 135 ft, at which point it was stopped, and the work of extending the north lateral drift resumed. On the second or 360 level, we are drifting south in the quartz body that the Kentuck company are working in. We are 150 ft from our south line, and finding bowlders of good ore in the same. From the old stopes on the third and fifth levels we are extracting about 15 tons of ore per day.

BALD MOUNTAIN DISTRICT.

GOOD REPORTS.—Eureka *Sentinel*, July 27: Messrs. Kaye and O'Laughlin, who returned yesterday from Bald Moutain, confirm the flattering reports that we have been hearing from that district. There is ore in profusion that crops out everywhere above the surface in bold ledges, auriferous, argentiferous and cupriferous. If it only holds good down below, Bald Mountain will be, within a year, one of the biggest camps in the country. Whether it will g. d., however, is as yet a *quien sabe* case.

BELMONT DISTRICT.

EMERSON.—*Courier*, July 27: They are now down over 40 ft in the Emerson mine, and the ledge at this point looks splendid. They are extracting ore that assays and works well. Mr. Emerson has made another rich strike on the east side of the hill. The shaft is now down about 20 ft, and chlorids ore that assays from $80 to $425 to the ton is exposed all the way. The ledge at the bottom is 7 ft in thickness, and is widening as work progresses. The mill is running nicely, and another fine bar of bullion will be shipped shortly.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, July 27: The formation in the main drift from the 8th shaft level continues very hard, and but 9 ft have been added to its length during the week. Crosscut No. 1, on this level, has advanced 11 ft into ground which shows very little change. The work to the west in the main drift on the 3d level is being pushed, and fair progress is being made in favorable ground. On the intermediate, between the 2d and 3d levels, the work of sinking on ore still continues. The ore is of good grade, but only 1 ft in width. Crosscutting is now progressing from the 10th level, to test the ground and ascertain if the ore body extends to that level, and to make connection with the winze just mentioned. The daily output of ore is about 04 tons. Mill No. 2 is running steadily and doing the usual good work. The bullion shipments amounted to $19 752.24 for the week ending July 27th, and foot up $64,333.06 on July account to the same date.

MOUNT DIABLO.—The north crosscut from winze No. 1 has reached a length of 54 ft, and that to the south is in 25 ft, and shows more favorable ground in the face. Winze No. 2 is down 50 ft. The north crosscut from winze No. 4 is in 87 ft, and the drift which was being run to the north from this crosscut has been stopped for the present, the work being transferred to raising on a 6-inch ledge of $50-ore found nearer the commencement of the drift. The face of the west drift from the Callison winze shows a 3-ft ledge of low-grade ore, containing streeks that will assay $70 per ton.

DOWNEYVILLE DISTRIOT.

STRIKE.—Cor. Grantsville *Bonanza:* Another strike of rich ore was made several days ago, evidently part of the same big silver chamber discovered some weeks ago, but higher up, and yesterday they opened another chamber, richer and grander than the silver cave found in June. One of the men said to me yesterday: "The silver cave found in June was but a baby as compared with the one found to-day." And all the indications go to show that immense chambers of ore are all around us. The intense heat of the ground in the mine in the different levels, drifts, etc., proves that theory. All who visited the mine the past month declared the mine was one of the grandest in the State. Could they come and see it now they would acknowledge there was nothing like it on the coast. People passing casually through town, seeing the few idle men round, and town quiet and orderly, think that it is strange, with such a mine, that there is not more life and bustle, and speak about how few men are employed. There are several reasons for that. When the furnace is running, there are about 50 men employed between the mine and furnace, besides the woodchoppers, coal burners and teamsters. Just now the furnace is not running, but a full force is at work preparing for the new furnace. When that is completed and gets to running, we will see livelier times; more men will be put on in the mine, and bullion shipments will be regular. "Slow, but sure," is a good motto; at least, for those employed. Pay-days come regularly every month and are always met promptly.

EUREKA DISTRICT.

LOCAL NOTES.—Eureka *Sentinel*, July 28: A great deal of ore is being shipped to Eureka from mines that are not called big claims and are not much spoken of except among miners. There are at least 25 of these within a radius of 5 miles, with Eureka as a center. Strikes and favorable prospects are reported almost daily. The consequence is that those who are watching the mining outlook are greatly encouraged, and more hopeful of the general prosperity of the camp than they have been at any time since the decline in the Richmond and Eureka Con. Besides the mines near by that have been referred to, valuable ore shipments are constantly coming in from the Silverado mines, which are about 14 miles from Eureka. Regular shipments are being made from the Jackson, Phenix, Oriental and Belmont, Members, Williamsburg (temporarily stopped by the fire), Bullwhacker, Idaho, Paul Pry, Silver Lick, Lone Pine, Macon City, Matamoras, Banner, Excelsior, Fourth of July, Dead Broke, Dugout, Bald Eagle, Industry, Bowman, New York, and numerous other so-called small properties, any of which are likely to develop into first-class mines.....In the El Dorado No. 2, the shaft is down within a few feet of the Eureka Tunnel level in a body of ore, samples of which were brought down yesterday for test.....The outlook in the Eureka Tunnel is flattering, and is reported to be improving daily, as developments are pushed. The ore body struck in the drift from the bottom of the shaft, 100 ft from the bottom of the winze, holds out rich, and is widening as the upraise progresses.....In the Albion, which still looks well, two finds were made yesterday, in new ground, where they were not expected. Supt. Robinson is greatly elated over the discoveries, the situation and extent of which we are not to give definitely, as we have not yet had an opportunity to see them, or talk to him about them. An average of 23 tons of pay ore is being shipped from the Albion daily.....There are 8 tributers working in the Phœnix, who have rich "pitches." There are 6 in the Jackson, who are also making big wages. These tributers are working under lease, with a contract for 60 days' notice to quit.....The Dugout is, as usual, yielding considerable rich ore.....We understand that arrangements have been completed by the Eastern company that purchased the Reeves & Berry, to put up a 20-stamp mill at the mine without delay. The machinery has been ordered.....The Geddes & Bertrand mill is working smoothly, reducing about 60 tons daily. The crushers are working to perfection, having been repaired. The silver solution in the settlers has been accumulating until a large amount is on hand ready to be converted into bullion as soon as the retort rooms are finished, which will be shortly. The mine still shows undiminished quantities of ore.....D. J. J. McLaughlin, proprietor of the Irish Embassador, is taking out ore from that mine continuously. The ore is high grade.....An important strike is reported to have been made in the Richmond between the third and fourth levels.....The Moosac, recently purchased by the Richmond company, is taking out considerable ore that is good.....There is a Swede working down the gulch below the Lenoon mill, washing out the tailings there for what was lost in the year's unsuccessful run of that mill, in quicksilver chiefly. He is reported to be making $3 a day.

LEWIS DISTRICT.

BETTY O'NEAL.—Lewis *Herald*, July 27: The shaft on the Betty O'Neal mine has been sunk 12½ ft, and is now down 92½ ft from the first station. The ore in the shaft is improving in quality. The width of the ledge is not known yet, but it is a large one. A station will be cut out at a depth of 115 ft, and levels started on the course of the ledge. The crosscut in ledge matter and the ore streak liable to be encountered any day. The stopes are looking well and the force at the mine will be increased. The ore will be extracted right away, and the new Highland Chief mill will run 10 stamps on Betty O'Neal ore.

MORNING STAR.—Upon the arrival of Mr. T. G. Morgan from New York, operations will be resumed on the Morning Star mine. A full force of miners will be placed at work grading for a mill at the forks of Lewis canyon, the company having determined to erect a 10-stamp crushing mill right away.

NOTES.—M. B. Record has discovered a galena ledge on the west side of Whisky canyon. Samples of the ore have been shown us, some of solid galena, others carrying yellow carbonates of lead, with cubes of mineral in places. The ore is found in white spar. The extent of the ledge is not fully known.....A ledge of good-looking quartz has been cut while grading for the wagon road to the Morning Star mine, and is supposed to be the continuation of Ed. Hanna's location.

PARADISE DISTRICT.

CREDIT MOBILIER MINE.—*Silver State*, July 27: A small quartz mill consigned to J. P. Cope, at Golconda, arrived here yesterday. It is intended for the Credit Mobilier mine in Paradise district, 22 miles northeast from town. This mine is owned by Cope & Sadorus. It has been prospected to a depth of 70 ft, and it produces some very rich gold-bearing quartz.

SILVERADO DISTRICT.

MARYLAND MINE.—Eureka *Sentinel*, July 27: This mine on Silverado mountain, Silverado district, White Pine county, 14 miles southeast of Eureka, is again coming into prominence. It was worked from 1869 until 1873—at first, as a mere prospect, but afterwerds being developed by Major McCoy and Paxton & Co., who obtained very handsome dividends therefrom. While the mine was yet looking well, it was sold to an English company for a large sum, said to have been $250,000. The purchasers, known as the Pinto mining company, went into liquidation as the ore gave out, and the property was bought up by the British mill and mining company. The mine has been leased from time to time since 1873 without any noteworthy result. Lately, however, Dick Berryman, a thorough-going miner, being convinced that the Maryland contained pay ore in quantity, obtained a lease of it. He went to work with four others about a month ago, commencing at the old workings and following a stringer of "mineral ash" in a northerly direction. Ten hours after work was begun ore was struck, which gradually widened out to 5 ft in thickness. They upraised on this; and, at last accounts, it was in ore one place 10 ft thick. The ore is a high-grade yellow carbonate, carrying a heavy per cent. of lead and considerable black metal. We are not informed as to how long the lease is for, but it is a long one. The mine is still owned by the British mill and mining company.

WILLOW CREEK DISTRICT.

A FIVE-STAMP MILL.—*Silver State*, July 26: The Willow Creek mines are coming to the front, and it is confidently predicted that the district will soon be counted among the leading mining camps in the State. The Ohio mine, the first discovered in the district, has produced ore that worked as high as $1,000 per ton, and is considered one of the best mines in the whole country. The Emma is represented as being also large, rich and well-defined, and there are numerous other leads in the district on which more or less work has been done, and in nearly all of which good ore is found. H. H. McColley and Judge T. J. Harlan have purchased the mill owned by the late M. H. Besley, in Relief district, and intend to remove it to Willow Creek forthwith. Judge Harlan leaves to-day for Relief, with a force of men, to get the machinery ready for shipment, and they expect to have it running in two months from date.

ARIZONA.

A HUACHUCA BONANZA.—Tombstone *Epitaph*, July 27: The Dunton mine, in Ramsey's canyon, is beginning to attract considerable attention, owing to the richness of the ore extracted at the surface. The ledge was found only a short time ago, although some $2,000 have been expended in work on the claim. The vein carries virgin silver, rich chlorides and galena. A 12-ft shaft has been sunk, and on the dump are 15 tons of first-class ore and 20 tons of second-class, all taken out by 2 men in 15 days. The ledge is 6 ft wide, carrying a 2-ft streak of ore impregnated with native and horn silver and black sulphuret, the balance containing galena ore, running high in silver. A lot of first-class ore will be shipped to a smelter and given a thorough working test. The mine is very available, being in a heavily-wooded country, within 1,000 yards of an abundance of water, and 8 or 9 miles from the railroad. A mile away a saw-mill will shortly be constructed. The fortunate owners of this remarkable prospect are G. W. McCullough and R. V. Dunton.

TOMBSTONE.—*Epitaph*, July 27: The prospects of the mining industry in this district were never so cheerful as at present. Never did those interested entertain such unbounded faith in the mineral wealth of Tombstone district, and never, since the first pick was stuck in the ground, has there been such zeal in development. There is no doubt but the quality of the mineral extracted is an improvement on that heretofore brought to the surface, and the supply seems inexhaustible. The Empire and Tranquility, in ighbors on Contention hill, are now yielding ore of a very high grade, and, from general appearances, promise to remain veritable bonanzas. The great producing mines are shipping the usual amount to the mills, and the Ingersoll, Stonewall and Randolph maintain the reputation of the western end of the district.

MONTANA.

RED MOUNTAIN DISTRICT.—Helena *Independent*, July 23: The district is situated 16 miles in a southwesterly direction from Helena, on the highest mountain in this vicinity, and is the largest mineral-bearing mountain in the Territory. There are about 25 good mines located in this district. J. H. Russell, who is the principal owner in the district, drove his first stake in 1867, and has located about 15 of the best mines in the camp.....The North Pacific was worked several years ago and 300 tons of ore shipped East for reduction, yielding from 130 to 614 ounces of silver to the ton. There are now about 4,000 tons on the dump, containing from 65 to 60 ounces per ton.....The Thomas is an extension of the South Pacific, and shows well for the slight amount of development made. This makes 4,500 ft on the same vein.....The Morrison is a spur of the South Pacific, and has been traced on the surface by prospect holes to the length of 600 ft, showing a vein of over 15 inches wide, and assaying 200 ounces.....The Flag mine has one shaft 54 ft deep and another 52 ft deep, situated 100 ft east. They are connected by a level, showing a body of good milling ore from 3 to 5 ft in width. The mine has been explored to a length of 400 ft.....The Bassett mine joins the South Pacific on the west and runs east and west. It has been traced 1,300 ft on the surface by 6 different shafts from 10 to 15 ft deep, showing an average of 3½ ft of good ore. Two tunnels, one 90 ft and the other 50 ft long, all the way on the vein, show very rich ore, assaying from 388 to 900 ounces in silver and $30 in gold.....The South Pacific is worked from the same tunnel. It is the same vein as that described above, and runs west. It is explored to a length of 600 ft and shows a continuous vein, 3 feet in width, of the same character of ore contained in the North Pacific.....The Silver Cord lays almost one-half mile south of the South Pacific. Its general course east and west. It has been traced about 600 ft on the surface by numerous prospect holes.....There is absolutely no question but that this is the best and richest cluster of mines in the Territory. But it lacks capital to develop the mines already discovered. There is but little ore in the district that is not milling ore, and it is not as base as the Butte ores.

THE MORNING STAR MINE.—Butte *Miner*, July 20: Developments advance in this property. There is on the dump about 325 tons of ore, 250 of which runs 87 ounces in silver and $22 gold per ton. The remaining 75 tons carries 60 ounces in silver and $14 in gold per ton. This ore is being reduced at the Silver Bow mill. There are 34 men at work in the Morning Star, and it seems that the greator this developments the richer the property. It will be remembered a half interest in this mine was bonded some months since for $60,000.

NEW MEXICO.

COPPER.—*New Mexican Mining News*, July 23: The smelters in the Burros are turning out large quantities of copper. One recently produced 4,000 lbs. of copper in 2 runs of 4 hours each.....Ore from the Copper King mine, Clifton, recently assayed in this city, ran 70% in copper, $50 in silver and $1,200 in gold.....Work has been started upon many of the mines in this vicinity. The mines are almost all looking well, and the surrounding districts are being rapidly improved.....Some very rich galena ore has recently been found in the King mine, near Eureka. Several pieces were assayed in this city that ran from $365 to $961 per ton in silver, averaging $632 per ton. Specimens of this ore will be sent to Denver with the Grant county cabinet.....Captain H. McHenry, one of the Chicago capitalists, who recently bought the Patton mines in the Mogollons, is making arrangements to have a mill erected on his property.

KELLEY.—Socorro *Sun*, July 23: The Kelley, the big mine of Middle Camp, has been running with about 40 men, and is taking out some beautiful ore. Under the able management of Mr. Charles E. Kingsbury, the Kelley will show up among the "big diggings" of the Territory. It is manned by Socorro men, and they are placing it in tip-top condition. For a week past negotiations have been pending for a sale of the Kelley to a company of Eastern capitalists. The figures named are large, and if the purchase is made, it is said that the parties purchasing intend to put on a big force and to push things lively.

GILA.—The new camp on the Gila, discovered by Dorsey, is one of the most promising camps in all that section. The mine, recently purchased by a Leadville company for $125,000, is showing a 20-ft breast of ore running rich in silver.....A rich strike is reported to have been made on Perche, near Hillsboro. The ore is native and born silver.

SHIPPING GOLD BULLION.—*New Mexico News-Press*, July 27: The Cimarron mining company is working its properties on Ute creek day and night, and is shipping bullion. Indications tend to show that the 2 principal leads, the Rebel Chief and Virginia, are likely to come together, forming one large vein, Virginia ore already having been found in the Rebel Chief tunnel. Considerable prospecting has been done, and as a result of tunneling and stoping in the hill between the 2 main leads several rich veins and stringers have been discovered. This week a rich strike was made, a 14-inch vein of iron sulphides being discovered which assay high in gold. Assays of $320 of gold per ton were turned, the lowest return ranging from $120 to $150 per ton. The properties never looked as well as at present, and Manager Fuller is encouraged to believe that at no great depth a large vein will be cut, which will yield rich ore. Good ore is being taken out, which is easily worked by the Hewland pulverizer and Scoville's patent pans, which process has proved to be a success. It is understood that the company will increase its force on the properties now that indications point to deposits of rich mineral in large bodies.

OREGON.

NOTES.—Jacksonville *Times*, July 28: Mining is almost entirely suspended.....It will take the Sterling mining company 2 months to clean up.....Mr. Derickson and J. B. Egen have relocated the Poorman's Creek ledge.....Derickson & Co. have some men engaged in cleaning out the Horsehead ledge, on Williams creek, preparatory to prospecting it.....Work is steadily progressing on Kreter & Miller's ditch, running from Cantrell gulch to Farmer's flat, several hands being employed.....The report that the copper mines near Waldo have been bonded to Boston capitalists or any one else, is emphatically denied from headquarters. Prospecting continues, but further than that nothing has been done with these mines.....Frank Rodgers, who has been mining on Silver creek with his father and brother, informs us that their claim has been worked out with good results and abandoned. He showed us several fine nuggets of gold, the heaviest of which is worth $21.75.....There are half a dozen miners on Silver creek, Josephine county yet, some of whom are doing fairly. McMullen & Johnson seem to have the best claim. As most of the diggings are very deep in that section, it will take capital to work them advantegeously.....John Miller, who is now in San Francisco, will also purchase a "little giant," hydraulic pipe and everything necessary to fit up in first-class style the mines he is interested in with Chris. Kretzer on Jackson creek. They propose operating on an extensive scale next season.....Ankeny & Co. are taking out rock from a ledge near Woodville, with the intention of having it fairly tested. The ledge has long been known about here as "the copper ledge," but it is said to assay well in gold and silver, also. Mr. Hansen, superintendent of the Blue Gravel mines at Galice creek, has charge of the work.....Geo. Brockendorf, an experienced prospector, is sinking on another ledge, on the mountain side, near Woodville.....Thomas Coker is also running in on an old ledge on Sciz creek, about 10 miles from here and near Mr. Hillis' place.....Other old prospectors are busy through the mountains, and Woodville post-office is doing a land-office business in the way of sending off rock for the assayer in Portland, Philadelphia, etc.....About all the Chinamen on Pleasant creek and Murphy gulch have finished cleaning up, and have gone below to work on the railroad.

UTAH.

STORMONT.—Silver Reef *Miner*, July 22: Working and developments going ahead about the same as at last report. The mill lost one day's run by another freshet, but is going ahead steadily now.

BARNES & WALKER.—The mine continues to look well; the usual quantity of good ore is being taken out. Two shifts are now being worked in the mine

CHRISTY.—The Hartman shaft is progressing at the rate of 20 ft a week. At the depth of 250 ft it is expected to cut the body of ore which the company now have in the west winze of the Tecumseh. Output of ore last week, 339 tons and 710 lbs.

Notes on Taxation.

How many people know that the money collected by the United States as taxes amounts to $150,000,000 each year in excese of all necessary demands for Government purposes? that is, thare is that much money brought annnally into the Treasnry of the United Ststes over and above all that is required for governmental expenses, for interest on the public debt, for pensions, and all other ontlay.

This somewhat startling fact is made the theme of an article on "Taxation Reform" in the last issue of the *International Review*, by W. C. Ford. He ehows forcibly that this excess of money drawn from the wealtb of the people is a severe burden upon industry and enterpriss. It amounts, on the average, to a tax on each individual of about three dollars per year in excess of what is required for good government. The effect of such a drain npon the productive etrength of the country, and the true principls which should hold in fixing taxes, are well portrayed by Mr. Ford as follows:

The question arises, what is done with tbis vast sum of $150,000,000 per year which is not needed for carrying on the Government, paying the debt and rewarding the soldiars? It ie in part allowed to accummulate in the U. S. Treasury and ths remainder is appropriated by the Government for various pnblic improvemente. Many of thess are no douht of public benefit, but it can not be donbted that this vast eum of money coming to Congress sacb year for disposition makes them freer with appropriations than ths public interest reqnires, and prompts a host of cormorants to hesiege the Capitol in the bope of profiting by assisting Congrese to spend its immense pile. The tendency toward extravagance, when one has a pocket full of money is generally recognized among individuals. It is not otherwise with legislative bodies.

Whence comes this vast excess of money into the National Treasury. Let Mr. Ford answer.

So far from recognizing tbe principle that national revenue sbould he governed by expenditure, until very recently an exactly opposite principle has been adopted that expenditure should be governed by revenue. Raise all the revenue that can be raised with the present taxes, and Congress will see that there is no difficulty in spending it. Is this just to the taxpayer? Is it defensible on any grounds whatever, whether of a political or economic nature? One million, fifty millions, or one hundred million dollars of revenue may he raised in excess of all that the Government can, under any possible contingency require, yet no serious attempt is made to reduce the revenue. Tbe taxes under whicb this revenue is raised may he opposed to all the principls of economics, yet no attempt is made to reform them. They may he unequal in their incidence, and weigh more heavily upon particular classes or interests, yet no change is proposed by which they may be made more equal. Tbeir effect may be to favor certain interests at the expense of others, yet no outcry against such legalized robbery is raised. These circumstances may point to two conclusions. First, that, heavy as the load of taxation is, it has not as yet acted injuriously upon the general welfare of tbe country, a striking illustration of the wonderful resources and productive power of the nation; and, secondly, tbat the people are, on the whole, indifferent to the subject of tax reform, and either from ignoraace or from inclination are content to leave well alone.

It must strike ths thoughtful as a peculiar circumstance that in many of the States the annual taxes are made to meet certain well-known and recognized expenditures, while in the United States the taxes go on without any refsrence at all to the neede of the Government at the time, and that Congress does its best to spend the money in some way. Mr. Ford, in his article, makes good uss of Great Britain as an illustration of a better system. There the budget is prepared by the Minister of the Exchequer to cover specified expenditures, and the rate of taxation is varied according to the neede of the country at the time. In this country the tax goes on year aftar year, except as Congress occasionally tinkere the tariff, no matter whether the immense revenue is needed or not.

The time now seems ripe for revenue reform in this country, and it ehould receive general attention from the tboughtful. It is certainly not wise to keep heaping up surplne revennes—ratber should the money be left with the people to whom it. belongs, increasing their comforts, developing their industries, eo that if the times should sver come for extraordinary expenditure, the people will be so strong and able that tbe added burden will not be oppressive.

THE AFRICAN GOLD FIELDS.—Ths indications are that ths promoters of the Africsn gold mining scheme are not going to make a success of it. It seems to have been designed to firs the English mining heart. There is an old mining proverb that no msn can tell what is nnderground, but ths weight of evidencs seeme to be against any development in Africa whicb will maintain the gold production at anything like tbe amount it has avsraged in tbe last 30 years. Ths gold fielde of the Tranevaal have bsen worked 10 or 12 yeare hy white men. Ths total production ie eetimated at $2,500,000, and the cost of mining it at not less than $40,000,000. The fabuloue talee recently set afloat regarding new discoveriee on the Guinea coast are now declared to bs mere inventione. The nativeehave known the value of tbe precioue metal from time immemorial, and, thongh crude miners, they are very keen in the eearcb, and little ie expected from the Gold Coast that has not long been known. Althongh there are etoriee of gold being washsd ont of tbe dirt daubed upon the wattles of ths native hute, ths amount doee not eeem to be more than could be washed out of any of tbe dirt in tbe streets of this city.

Artesian Wells on the Great Plains.

The interest in artesian wells in California is continnally on the increase. Botb for city water supply and tbe irrigation of farming lands, new wells are continually being bored, and gratifying successes are being secured. We have a country peculiarly adapted to the flow of artesian water, the geological formation presnting water-bearing strata at a comparatively little depth. Just now, the greateet activity in well-boring is in Tnlare county, and most gratifying results are being attained. The welle will soon change the face of the country from the yellow of dry plains to the perpetual green of a well-watersd land.

We have allnded several timee to the Government snterprise in boring experimental wells on the great plains on the eastern slope of ths Rocky mountains. One of the Government Commissioners, Prof. C. A. White, has just given an account in tbe *North American Review*, which furnishee the best review we have eeen of the conditions affecting the flow of arteeian water on these plains. We propose to outlins Prof. White'e conclusions, for, asids from their local hearings in relation to the districts described, they contain certain general deductions concerning artesian wells which will be of intsrest to many of our readers wbo are considering ths subject.

Prof. White confines bis statements to the rsgion whicb he has personally sxamined as a member of the Government Commission, namely, to that part of Colorado which liee eaet of the eastern hase of the Rocky mountains, and to adjoining portions of Kansas, Nebraska and Wyoming:

The geological structure of this portion of the great plains and of the adjacent mountains ie very simple, and it may he rsadily understood by those who are not geologists. The mountains are almost entirely composed of archæan nnstratifiad rocks, which are mostly of coarse, irregular texture, and eimilar to ths granitee in composition. The plains are underlaid by eix or ssven separate formatione of stratified rocks, which lie in snccessivs order upon each other, and extend like broad sheets beneath the whols district, the whole being covered as with a mantle hy ths eupsrficial deposits of the plains. These formations rangs in geological age from the Tertiary to ths Triassic, inclusive. They have an aggregate thicknsss near the mountains of about 8,000 ft.; but they evidently thin out rapidly to the eastward, so that borings would pierce them at a less depth in the eastern part of the district than in the western. The whole series of these strata is flexed np abrnptly against the mountains, and their upturned edges enter largely into the etructure of the foothills there. The lowermost formation of the series is there seen to rsst directly upon the archæan rocks; but, whether beneath the plains other formations intervene betwesn the archæan rocke and ths lowest group of the seriee of stratified rocks just mentioned, ie not known. Thie, bowever, has little practical hearing upon the question of artesian watsr snpply, because it is believed that, if water ehould not be obtained in the Triassic formation, the probabilities for euccess hy deeper boring are not enconraging.

The three uppermost of these formations, or groups of strata, which are known as the Laramis, Fox Hills and Colorado groups, respectively (the two latter being of Cretaceoue age, and the former occupying an intermediate position between the Cretaceous and Tertiary), are such in composition and character that they may hs regarded as practically impervious to water. The fourth formation in the descending ordsr is the Dakota gronp, of the Cretaceous eeries. This is composed of coarse, rough sandstone, and being hut slightly compacted, it is doubtless as pervions to watsr as any of the ordinary stratified rocks. The fifth formation, tbe Jurassic, is of an impervious cbaracter; and the sixtb, tbe Triassic, is, in part at least, a pervions one. In view of the facte which are yet to be stated, it may be reasonably presumed that both these pervious formations are really water-hearing. In the valley of the South Platte river the first of thess formatione hae been removed by erosion, exposing the second. In that of the Arkansss, the first and eecond bave bsen thus removed, and in a part of tbat valley the tbird formation bas also been rsmoved, exposing for a few miles the fourth, which bas just heen spoken of as a pervions one.

If borings wsre to be made upon the plains betwsen the Arkansas and South Platts rivers in the neighborhood of the mountains, it is estimated that the first of the presumably water-bearing formatione that have been mentionsd may he reached at a depth of not lese than 2,000 ft., and the second at from 600 to 800 ft. deeper. In the eastern portion of the dietrict these two formatione may probahly be reached by boring at a mucb lese depth, reepectively, than in the weetsrn; becauss, as before remarked, the formatione become thinner in that direction. Near the mountains, there are in thie district eome isolated Tertiary depoeite not referred to in the eeriee just described. Theee are of limited extent, and riee from 100 to 200 ft. or more above the general level of the plaine, Thay are nearly level, composed of coarse, psrvious material, and are drier, if poesible, than the plaine around them.

We have eeen that the tbree uppermoet of tbe formatione whicb underlie the plains, having an aggregate thickness of probably not lese tban 2,000 ft., are practically impervious to water. Because of tbie, and of the excessive dryness of the atmospbere dnring a large part of the year, which causss tbe evaporation of ths soanty rainfall almost as eoon as it ie precipitated, none of that water can be expected to accumulate in the strata beneath. Beside rainfall, thers is no other primary eonrce of water supply in all that great, elevated region. Therefore, any supply of water that may exist in the strata hsneath ths district I am here conaidering must be derived from the rainfall that is precipitated, not upon the district itself, but upon the adjoining mountain district—tbat is, that supply mnet coms from the watsr that falle upon the npturned edges of the formations at the foothills, and from that whicb constantly flows across them in ths mountain streams that reach tbe plains. While, as ie evident, the greater part of that water will flow off to the rivers, a part of it will eoak down through the two pervious formations that have already been mentioned. The dip of all the strata hsing continnous to the eastward, it is plain that this water will, by gravitation, become widely distributed in the two pervions formations, and he held thers hy the impervious ones which overlie them respectively. If the latter are piercad by horings from the surface of the plains, the water which hae thus been confined there will, as is wall known, rise by hydrostatic pressure.

Now, let ns consider the views that have heeu expressed by various persons, both pnblicly snd privately, upon the snbject of artesian wells upon the great plains. Some have expressed ths opinion that those plains may be everywhere irrigated for cultivation by means of artesian walls; but they are niostly of the clase who believe that "water may be obtsined anywhere, if yon only go deep enough." If such a resnlt were poesible, even in the most favored districts, the absurdity of the idea as applied to the district in question is apparent whsn it ie remembered that the annual mean of the rainfall of this district, together with that of ths adjoining mountain district which is drained upon it, ie much lese than the minimum amount that is necessary to raise a farm crop. Beside this, much the greater part of the annual rainfall referrad to runs off by the rivers where, however available it may be for purposes of irrigation, it is not to be considered in connection with artesian wells. It is plain, therefore, that if all ths welle that might be successfully bored in this district wers in operation, it would not be practicable to irrigate more than a small portion of the land by that means.

But is it practicable to irrigate lande for successful farming by means of artesian welle? Perhaps ths beet accessible information upon that snbject ie contained in the rsport of the State Engineer of California for 1880, from which the following data are taken. Up to that time about 1,000 wells had bsen bored in Los Angeles and San Bernardino counties, and too small a number seem to have been bored in other parts of ths State to receivs especial discussion in that report. The deeper wells are 500 ft., but the average depth is from 150 to 200 ft; average cost, $400 each; averags discharge of water per wall, 0.1 cubic foot per second. Experience there shows that it takee a flow of one cubic foot per second to irrigate ons hundred acree of land. The average well will therefore irrigate 10 acres, and the average cost of such a wsll will add $40 per acre to the original cost of the land. The greatest flow from any of these California wells is that of the Burlingame well near Compton, which amonnts to 1.7 cubic ft. per eecond; enough to irrigate 170 acres. The water of those wells has been found suitable for agricultural pnrposes, but all artesian water is not eo.

Let us apply the data furnished by the California welle to the subject of similar wells npon the great plains within the district under discussion. The cbaracter of the euperficial and Tertiary deposite within this district is such that it does not seem probable that any snccessful artesian wells may ever bs obtained in them. If this judgment is correct, no wells are likely to be obtained in this district of as little depth as the deeper of thoss California wells that have been rsferred to. It has been explained that tbe uppermost of the two presumably water-bearing formations whicb underlie the district cannot probably he reached between the valleys of the Arkansas and South Platte rivers at a less depth than from 1,200 to 2,000. ft. The cost of a well of ths lesser deptb in this district need not, even nnder favorable circumstances, be estimated at less than $6,000. If eucb a wsll should yield water at the rate of one cubic foot per second, an average result as favorable as can be reasonably expected, it would irrigate 100 acres of laud; but the cost of sucb a well wonld add $60 per acre to the original cost of the land. Theee facts are certainly very unfavorable to ths proposition to irrigate the eoil of the plains for cultivation by meane of arteeian walls; especially whsn we consider the greet risk of failure to get an adequate supply of water. if any at all, the risk of obstruction of the flow, and the probsbility that a greater depth than 1,200 ft. must be borad.

These facts, opposed ae they are to the bope of profitable irrigation of farming land npon the plains, do not necessarily prove that welle may not be profitably borsd at many placee there, to bs used for other than irrigating purpoeee. A well giving no more than one-quarter of a cubic foot per second would be eufficient to water large herds of cattle, beside eupplying the wants of a emall hamlet of peoplo. There are many portione of the plains bearing an abundant growth of grass, but distant from any constant eupply of water, whsre the value of such a well wonld bs many times greater than that of any well could be for purpoees of irrigation alone. That many wells of satisfactory capacity may be obtained npon tbs plains east of the Rocky mountains, there appears to be no good reason to doubt. Neither ie it improbable that in the vicinity of eome of the mountains there may be found districts where wells as numerous, copious and as shallow ae those of California may be obtained. But ths risk of failure has hitherto proved to be so great that no boring ought to be nndertaken upon any portion of the great plains, without the known results of a careful geological examination of the region by compstent persons.

Recent Contributions to the California State Mining Bureau.

Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

4045. Lignite—Icy cape, Arctic ocean. Charles A. Laws First Assistant Engineer, U. S. steamer *Corwin*.
4046. Egg of Empress Goose—St. Michaels, Alaska. Lieut. M. A. Healy, U. S. steamer *Corwin*.
4047. Egg of Sea Fowl—St. Michaels, Alaska. Lieut. M. A. Healy, U. S. steamer *Corwin*.
4048. Fossil Fern in Schist—River Ain, France.
4049. Heads of Baked Clay—Taken from the Aztec pyramid of "El Sol," near the town of San Juan, 40 miles from the city of Mexico. These faces have Egyptian and negro features. The pyramid of "El Sol" is 300 ft. high, and has a square base like those of Egypt. Each side faces one of the cardinal points of the compass. Jay C. Kelley.
4050. Chromate of Potash—To illustrate the economic uses of chromic iron.
4051. Bichromate of Potash—To illustrate the economic uses of chromic iron.
4052. Solar Salt—Virginia salt marsh, Esmeralda county, Nev. J. R. Scupham.
4053. Borax Crystals—Found in the mud at Virginia salt marsh, Esmeralda county, Nev. J. R. Scupham.
4054. Dechenite (Vanadate of Lead and Zinc)—Morning Star mine, Leadville, Col. Jay C. Kelley.
4055. Scheelite—From a quartz ledge on Howard hill, Grass Valley, Nevada county, Cal. Charles Mitchell.
4056. Phosphorescent Dolomite, "Hell Fire Rock" of the Miners—Shenandoah mine, Snake Creek district, Wahsatch county, Utah. D. B. Huntley. Another larger specimen from the Addie mine, same locality, A. B. Paul.
4057. Porphyry (Probably Diorite)—Placer county, Cal. Said to be found in large quantities. A very beautiful building and ornamental stone, equal to the finest porphyries of Egypt and Europe. A. S. Coburn.
4058. Iron Ore—Said to occur in large quantities one mile northeast of Sperry's hotel, Murphy's, Calaveras county, Cal. Lies between beds of limestone and slate. Plenty of wood and water. Dr. William Jones.
4059. Iron Ore—Skagett river, Washington Territory. Seems to be a mixture of limonite and hematite. It gives water in glass tube, and is strongly magnetic, only partly soluble in acids. It is said to occur in large quantities with limestone and coal. Henry Abbott.
4060. Ornamental Stone—Allied to agalmatolite, pagodite, etc. A hydrosilicate of alumina, magnesia, lime, iron, etc. San Luis Obispo county, Cal. W. H. Barton.
4061. Indian Pipe of Red Stone—Pima villages, Arizona. Dr. William Jones.
4062. Fossil Resin—Hydraulic mines at North Bloomfield, Nevada county, Cal., 280 ft. below the surface.
4063. Silver Ore—Walball mine, Calico mountain, San Bernardino county, Cal. T. N. Wand.
4064. Mica—Near Lang, Los Angeles county, Cal. J. R. Wolverton.
4065. Conglomerate Bowlder—Pescadero, San Mateo county, Cal. J. Z. Davis.
4066. Hydrous Silicate of Alumina, Probably "Variclte" (See No. 3374)—Columbus, Esmeralda county, Nev. Analysis by W. H. Souchley, M. E.: Water, 23.40; alumina, 30.15; insoluble, 0.51; phosphoric acid, 44.17; total, 98 21. Hardness, 5 to 5.5, specific gravity, 2.501 to 2.52; soluble in caustic potash. C. F. Allen.
4067. Terebratula (Undetermined Fossil)—Near Fort Apache, Arizona. Patrick Gannon.
4068. Fossils (Undetermined)—Near Fort Apache, Arizona. Patrick Gannon.
4069. Pink Calcite—Small Hill mine, Santa Catalina island, Cal. Stephen Boushey.
4070. Sphalerite (Zinc Blende), with Calcite—Small Hill mine, Santa Catalina island, Cal. Stephen Boushey.
4071. Galena—Small Hill mine, Santa Catalina island, Cal. Stephen Boushey.
4072. Silver Ore—Small Hill mine, Santa Catalina island, Cal. Stephen Boushey.
4073. Silver Ore—Silver King district, Calico mountain, San Bernardino county, Cal. H. G. Maynard.
4074. Silver Ore—Oriental mine, Calico mountain, San Bernardino county, Cal. Judge James Walsh.
4075. Silver Ore (Embolite)—Grapevine district, San Bernardino county, Cal. H. G. Maynard.
4076. King or Horseshoe Crab (Limulus, Sp.)—Coast of New Jersey. J. Z. Davis.
4077. Pisolite (Carbonate of Lime)—Each globule is a series of concentric shells, enclosing, frequently, a grain of sand as a nucleus. Humboldt county, Nev., near Derby's ranch, Hot Springs. John Flemming.
4078. Bog Iron Ore—Island in the Straits of Georgia, Washington Territory. Henry Abbott.
4079. Slate—Near Emigrant Gap, Placer county, Cal. W. H. Murray.

PRE-HISTORIC MINERS.—The copper mines now worked in Michigan, on the shores of Lake Superior, are sitnated on the workings of that interesting race, tbs copper miners of Lake Superior. Their excavations can be readily traced at a depth of from 10 to 20 feet in the solid rock. Their pits, on the Isle Royale alone, covering an area of more than a mile and a half in length. Their hammers are frequantly found in large heaps. Altbough they carried away an enormous quantity of copper, and must have worked through many yeare, yet thay seem never to have known that copper could bs smelted, for tbey left all fragments too small to use, and tbe masses too heavy to lift, and no traces of the action of fire have ever been discovered. Some Cornish miners working recently in ons of the mines cut down a dead cedar. Ae they were bewing it out a small, but perfectly-formed hammer dropped from the center of the log. Ths tree was fonnd to bs nearly 250 years old, and had been dead hundreds of years. How curious it seeme that the Cornieh miners bave come from the Eset to continue the work of a departed Asiatic race, who came from the West at a period far back in the ehadowy past.

THE last ehipment of ore from the Vekol mine of this county, consieted of 300 eacke, tbe net weigbt of which was 24,995 pounds. It was sold in open market in San Francisco to Helmrick & Haneen for $3,774 09. The aseay value per ton was $413.25, and the lot netted Meesrs. Brady & Walker $3,427.85. Professor Cburch will have charge of ths Vekol exbibit at Denver. He has taken a great intereet in the mine on account of its being considered a great geological wondsr. The ore will be displayed in a bandsome cabinet, made in Denver hy order of Meeere. Brady & Walker.—*Florence Enterprise.*

The Calaveras Dams.

The announcement that a suit was about to be instituted by the Board of Supervisors of San Joaquin county to restrain the further dumping of mining debris into the Calaveras or its tributaries brought Supt. O. T. Knight, of Salt Spring Valley Water, Irrigation and Mining Co., to the city with a proposal to compromise. Mr. Knight stated that the company he represented would forthwith commence the building of impounding dams at suitable places below their claims, which works would effectually abate the nuisance complained of. Of course, this was in avent of proceedings at law being stopped. The board seemed willing to give the proposed works a fair trial, and it is understood that the intended suit will be abandoned. Mr. Knight's proposition is identical with that laid before the representatives of the Anti-Debris Association of the Sacramento valley, at Marysville, last week, and was promptly rejected. The action of the local board, in agreeing to try every reasonable expedient before embarking in almost endless litigation, will commend itself to fair-minded citizens. Sacramento tried the fighting method, and after an expenditure of $20,000, succeeded in obtaining a qualified decree in a single case, which permits hydraulic mining under the conditions offered by the Calaveras Co., which could as well have been brought about without ever bringing the matter into court. Marysville refused an offer of $40,000 to stay the bringing of her injunction suits for only 60 days. Two years have now elapsed, however, and the mines are in operation as usual. It is doubtful if great economic questions of this kind are proper issues for judicial determination—*Stockton Independent.*

Silver Mining.

The silver mining interests in this country, says the Eureka (Nevada) *Leader*, have attained such vast proportions as to attract the attention of the world. It is manifest that these interests will more and more absorb home and foreign capital. Mining for the precious metals is, in the old countries, a business in which royalty and nobility engage, in the belief that they do not thereby detract from the dignity of their high station.

The silver mines of our greatest mountain chain are admitted in all countries to be superior to all others in the world. They, and they alone, have created out of vast tracts of wilderness and desert, populous, rich and thriving States and Territories—and all this within the space of a few years. Very many of the money princes of the world owe their great wealth to the mines of Colorada, Nevada, California and Arizona. They had faith in the inexhaustible mineral resources of the Rocky mountains, and the result has justified their faith. In these mountains silver mining has arrived at the stage of a regular and systematic industry, an industry of which the United States Commissioners of Mining Statistics say: "It is the safest and most profitable of all industries. It is never hurt or shaken by panics, which are becoming so frequent, and which so often retard or ruin every other industry.—*Prescott Courier.*

A Convenient Mine.—The Greenville *Bulletin* has the following in regard to a Plumas county mine, the Genesee, owned by Dr. Quinn: The method followed by Dr. Quinn in working his mill will doubtless excite a smile. We will give the facts in his own words as nearly as possible: "When I want a thousand dollars or so I have a few tons of ore taken out and then start up the mill; I drop the stamps at nine o'clock in the morning and let them run till seven in the evening and then stop; next morning I clean up from seven till nine; then start up as before. The mill is never run on Sundays. I am now so old that my energy and ambition are gone. I only care to live in ease and moderate comfort; my gold is safer in the mine than it would be in a bank, and when I want it it is always within easy reach. I only run the mill a month or so occasionally in the summer or fall; that gives me all I need." The worthy Doctor is a hale, hearty and jovial man of nearly seventy; has seen much of the world; is well read in various literatures, especially English and Spanish, and to share his hospitality and conversation is such a treat as one rarely enjoys.

Bald Mountain Copper.—Bald Mountain, besides showing excellent prospects in gold ore, promises to be an important district for the production of copper also. Messrs. Clark and Adams have some specimens of copper ore from that quarter which are regarded by experts as the richest ever found in the country. These specimens will be sent to San Francisco for thorough chemical analyses, after which they can be spoken of more definitely. There is a large belt of copper croppings extending over two miles, hence it is expected that the quantity of ore will be found large when developed. —*Eureka Sentinel.*

Standard Employes.—The number of employes in the Standard mine July 23d was as follows: Eighty-four miners, 16 carmen, two skipmen, four tramwaymen, three firemen, three blacksmith-helpers, four watchmen, seven laborers, three station-tenders, one time-keeper, three ore-sorters, two woodmen, eleven carpenters, two blacksmiths, seven engineers, three brakemen, one ropeman, two shift-bosses, one chief-engineer, one boss-blacksmith, one pumpman, one foreman and one clerk.

Useful Information.

Hints on Painting Old Woodwork.

As soon as there have been one or two hard frosts to kill most of the flies, it will be an excellent time to paint woodwork in the kitchen, or any other part of the house. Saying nothing of the economy of painting, it is an excellent practice to apply a thin coat of paint to all the woodwork of the kitchen, once in two or three years. Good paint always saves much hard labor in keeping such parts of a house clean. Some doors that are used often, need painting every year, to keep them at all decent. It is not best to put on thick, heavy coats, as these are needlessly expensive, and after a few years will look bad. The same amount of paints, applied often in thin coats, will look better and cost little more.

Where woodwork is much soiled, especially by hands not scrupulously clean, it is sometimes difficult to make even the best of paint hold well. It will dry soon enough, but will afterwards peel off, for paint will not adhere well to a dirty, greasy surface. This is particularly the case in rooms where washing and cooking are usually carried on.

In order to make paint stick and become about as firm as the wood itself, wash the surface thoroughly with moderately strong lye, using a short swab, then wipe it off with a cloth wrung out in fresh water. This will remove all grease and dirt that prevent the paint from taking a firm hold.

Paint for such places should be made of the best white lead, mixed to the consistence of thin cream, with two parts of the best boiled linseed oil, and one part of good lacquer, or "liquid drier." Such paint will dry in one day and become sufficiently hard to handle in a few days. A very small quantity of lamp-black will make a beautiful lead color. Yellow ochre may be added until the paint is of the desired shade for floors, mop-boards, or wainscoting. Pure white lead for the body will make a much more durable paint for floors than most other kinds. The use of zinc-white, which is much superior to white lead in some situations, as for instance in privies, is attended by a little difficulty, because it must be applied very thick to cover well when used alone; but a second coat, not so thick, may be put on over other paint, and it will add greater brilliancy and will not tarnish from sulphurous gases frequently rising from sink-drains, etc., nor from the exclusion of light, which causes white lead paint to turn yellow.—*Am. Agriculturist.*

How Mirrors May be Ruined.—It is a fact worth knowing, but which does not seem generally understood, that the amalgam of tin-foil with mercury, which is spread on glass plates to make looking-glasses, is very readily crystallized by actinic solar rays. A mirror hung where the sun can shine on it is usually spoiled; it takes a granulated appearance familiar to housekeepers, though they may not be acquainted with its cause. In such a state the article is nearly worthless; the continuity of its surface is destroyed, and it will not reflect outlines with any approach to precision. Care should therefore be exercised in hanging. If any of our readers have mirrors which appear to be spoiling, it would be well to ascertain whether the direct sunlight strikes them. If thus exposed, they can probably be saved from further injury by simply changing their position. The back, as well as the front, must be protected. A small glass hung in a window where the rays strike it behind is peculiarly exposed. The back should always be covered where the beams are likely to touch it. It is also well to avoid hanging a mirror near a stove or fire-place, where the heat radiated can reach it. If this precaution is neglected, granulation is likely to occur, even in a comparatively dark room, by the influence of warmth instead of light. A lamp or gas jet, if placed too close while burning, though it may not crack the glass, will often bring about the same injurious crystallization, and will even sometimes cause the amalgam to melt and run off.

To Restore Scratched Furniture.—Scrape one pound of beeswax into shavings in a pan; add half a gallon of spirits of turpentine and one pint of linseed oil. Let it remain 12 hours, then stir it well with a stick into a liquid; while stirring, add one quarter of a pound of shellac varnish and one ounce alkanet root. Put this mixture into a gallon jar, and stand it before the fire, or in an oven, for a week (to keep it just warm); shake it up three or four times a day. Then strain it through a hair seive and bottle it. Pour about a teaspoonful on a wad of haize; go lightly over the face and other parts of the furniture, then rub briskly with a similar dry wad, and in three minutes it will produce a dark, brilliant polish, unequaled. Another preparation may be made as follows: Make a mixture of three parts linseed oil and one part spirits of turpentine. It not only covers the disfigured surface, but restores wood to its original color, and leaves a luster upon the surface. Put on with a woolen cloth, and when dry, rub with wool.

When to Apply Paint.—Paint, to last long, should be put on early in winter or spring, when it is cold and no dust flying. Paint put on in cold weather forms a body or coat upon the surface of the wood that becomes hard and resists weather or an edge tool even, like slate.

Cloth of Tin.—A French chemist is said to have invented a process by which fabrics can be permeated by a solution of tin. The method is described as follows: He first makes a mixture of zinc powder and dissolved albumen, which he spreads over the fabric by means of a brush, leaving it to dry, when the stuff is passed first through superheated steam, and afterward through a solution of chloride of tin. By this means an exceedingly thin layer of tin is spread over the whole side of the fabric, which is thus rendered waterproof, and protected against ordinary rough usage. The utility of the invention is not quite apparent, for probably few people would care to don garments in which they would bear a very close resemblance to animated tin kettles and teapots, though, in the preparation of theatrical dresses, and even the bright "trimmings" in which the female heart delights, the invention might find a limited application.

Archimedes and the Lever.—The apothegm of Archimedes—"Give me a lever long enough and a prop strong enough, and I will move the world"—arose from his knowledge of the possible effects of machinery; and, however it might astonish a Greek of his day, would now be readily admitted to be as theoretically possible as it is practically impossible; for, in the words of Dr. Arnott, Archimedes "would have required to move with the velocity of a cannon-ball for millions of years to alter the position of the earth by a small part of an inch. This feat of Archimedes is, in mathematical truth, performed by every man who leaps from the ground, for he kicks the world away from him whenever he rises, and attracts it again when he falls."

Wagon Wheels.—To prevent the tire of a wagon wheel from coming loose and requiring to be refitted, a method highly recommended is to fill the felloes with linseed oil before the tire is put on. The timber thus treated is not liable to injury by water, and lasts much longer. The process followed is to hang the wheel in the oil, each felloe being immersed for one hour. The oil, which is contained in a cast-iron heater of suitable length, is brought to a boiling heat—a higher degree must be avoided, or the wood will be burned. The timber should be dry, as in a green state it will not take oil. The tire of a wheel thus treated, will, it is said, wear out before becoming loose.

Whitening Smoked Walls.—A method of cleaning and whitening smoked walls consists, in the first place, of rubbing all the black, loose dirt off them, by means of a broom, and then washing them down with a strong soda lye, which is to be afterwards removed by means of water to which a little hydrochloric acid has been added. When the walls are dry, a thin coating of lime, with the addition of a solution of alum, is to be applied. After this has become perfectly dry, the walls are to be calcimined, or coated with a solution of glue and chalk.

Good Health.

Bruises and Cuts.

At the present time, when accidents are so common, it is the duty of every one to learn how to take care of the sick or injured. If any serious or sudden injury happens to a member of a family and one knows what to do, it may be the means of saving a life. Young people in the shop, in mines, or on the farm, are liable to get hurt or injured in some way or other—either "cut" or bruised. The bruised limb should rest, be kept moderately warm, bathed frequently with tepid water and chafed gently with the naked hand.

In case of incised wounds (cuts), at first there is free bleeding from the many divided capillaries. If no large vein or artery is severed, the flow of blood will soon cease; press the lips of the wound together and trickle on cold water until the blood and all foreign matter is removed; then apply narrow strips of adhesive plaster. The union of the divided parts is effected by the action of the blood vessels, and not by healing salves. The one thing is to keep the parts together and protect the wound from the air; nature will do the rest.

In any deep wound, where a vein is severed, tie a handkerchief, or any band, *below* the wound. If an artery, tie it *above* the wound; sometimes in case of an artery, it is difficult to stop the flow of blood. If there is any trouble, place over the artery and under the bandage a cork, or else twist the handkerchief by placing a stick under it and keeping the knot over the artery as the artery can be felt by its pulsation. In binding up the wound, keep the limb so as to have as little strain as possible upon the wound. The care should be the same as any cut.

The Best Medicines.—*Hall's Journal of Health* says the best medicines in the world in the cure of disease are warmth, rest, cleanliness and pure air. Some persons make it a virtue to brave disease, "to keep up" as long as they can move a foot; and sometimes they succeed, but oftener the powers of life are hereby so completely exhausted that the system has lost all ability to recuperate. Whenever walking or work is an effort, a warm bed and a cool room are the first indispensable step to a sure and speedy recovery. Instinct leads all beasts and birds to quietude and rest the very moment disease or wounds assail the system.

The Heart and Its Diseases.

Death from heart disease is of alarming frequency. Almost daily we hear that friends or acquaintances, or public men have suddenly died, and on inquiry it is found that the heart was at fault. This fact has not unfrequently given rise to the remark that it is strange the heart should so often be the seat of mortal disease. But the truth is we attach far too little importance to this organ and its functions. It performs its great office so quietly and uninterruptedly that we even forget its existence. From a period anterior to birth until death, during sleeping as well as waking hours, ceaselessly and noiselessly, with steady and measured rhythm, it circulates the vital fluids through every tissue of the body. Seventy-five times it pulsates in a minute, 108,000 times in the day, without exhaustion or apparent need of repose.

The heart is a hollow muscular organ, weighing but 10 ounces, and is suspended in the cavity of the chest by delicate ligaments; and yet, it performs quietly and noiselessly, with but the slightest jar, an incredible amount of labor. In 24 hours it is estimated that the heart accomplishes more than three times as much work as a common laborer in 10 hours. "Three old women sitting by the fire," says a recent scientific writer, "alternately spinning and sleeping, do more work by the constant beating of their hearts than can be done in a day by the youngest and strongest laborer." He adds: "No labor that we can undertake is regarded as more severe than that of the muscle employed during a boat race; and yet this labor, severe as it is, is only three-fourths of that exerted day and night, during life, by each of our hearts."

If the entire force of the heart were expended in lifting its own weight vertically, it would be raised 19,754 ft. in one hour. Compare this with the exertions of an active pedestrian, who can raise his own weight but 1,000 ft. per hour, and we find the heart exerts itself about 20 times as much force; or with the best locomotive, which can raise its own weight 2,700 ft. in one hour, which is but one-eighth of the energy of the human heart. To a reflective mind, it cannot be a matter of surprise that this delicately-constructed organ, laboring so vigorously without a moment's rest day or night, should frequently and often suddenly, give over its labor and cease to act. On the contrary, it is rather a matter of astonishment that the heart should maintain its integrity, year after year, amid the scenes of excitements through which the individual passes for three score years and ten. In severest sickness, when other organs fail, the heart pursues the even tenor of its way, continuing its pulsation to the last moment of life. Like a strong warrior in a citadel, it yields only when every resource has been exhausted.

Curing Discharge of the Ears.—An exchange has the following on this subject: As the cause of such trouble is always constitutional, local applications are of no benefit, and besides may be dangerous for the delicate organs of hearing. Many a patient has become deaf by a treatment which was recommended with the best intentions. The causes may be manifold, a hereditary taint, want of exercise in the open, fresh air, sleeping in an ill-ventilated bedroom, improper food, injudicious diet, use of stimulants, indulgence in exhausting passions, vicious habits, etc. It must not be lost sight of that conditions differ, and that what will not harm one man except in later life, will at once affect others. The cure is evident; take out-of-door exercise, sleep with your windows open, only take care not to catch cold in a draft, watch your digestion and eat only what agrees with you, but indulge in a variety of food, use no tobacco or liquor of any kind, but if necessary some mild cathartic, and add to this the daily use of some blood-purifying decoction of sarsaparilla, sassafras, or its equivalent, and marry, if you have no wife. Remember that married men are in general healthier and live longer than bachelors. Life insurance companies understand this.

The Healthfulness of Lemons.—When people feel the need of an acid if they would let vinegar alone, and use lemons or apples, they would feel just as well satisfied and receive no injury. A suggestion may not come amiss as to a good plan when lemons are cheap in the market. A person should then purchase several dozen at once, and prepare them for use in the warm, weak days of the spring and summer when acids, especially citric and malic, or the acid of lemons, are so grateful and useful. Press your hand on the lemon and roll it back and forth briskly on the table to make it squeeze more easily; then press the juice into a bowl or tumbler—never into a tin; strain out all the seeds, as they give a bad taste. Remove all the pulp from the peels, and boil in water—a pint for a dozen pulps—to extract the acid. A few minutes' boiling is enough; then strain the water with the juice of the lemons; put a pound of white sugar to a pint of the juice; boil ten minutes, bottle it, and your lemonade is ready. Put a teaspoonful or two of this lemon syrup in a glass of water, and have a cooling healthful drink.

Remedy for Painful Wounds.—Take a pan or shovel with burning coals and sprinkle upon them common brown sugar, and hold the wounded part in the smoke. In a few minutes the pain will generally be allayed, and recovery proceeds rapidly.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Lead Poisoning; Suspended Gold; The Pacific Galena-Silver Smelter, 81. Passing Events; Denver Mining Exposition; Ors Concentration; Foundry Notes; Steel from Beach Sands; Mechanics' Institute Exhibition, 88. Recent Discoveries on the Planet Mars; Hints to Prospectors; Contributions to the Geology and Mineralogy of California—No. 6, 89. Patents and Inventions; Notices of Recent Patents, 92.

ILLUSTRATIONS.—The Pacific Galena-Silver Smelter. 81. Projection of the Surfaces of the Planet Mars. 89.

MECHANICAL PROGRESS.—Wrought Iron Philosophically Considered; Mechanics; Band Saws vs. Circular Saws; Facts in Mechanical Construction; Uniform Motion; New Styles for Finishing; Improvements in Watch Making; A Seamless Ship, 83.

SCIENTIFIC PROGRESS.—How Fish Find their Own Rivers; Silicated Carbon Filters; Architecture of Animal Life; Scientific Paradoxes; How the Diamond Cuts Glass; Sounds Produced by the Effects of Jets on Diaphragms, 83.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends, 84.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Montana, New Mexico, Oregon, and Utah, 84-85.

USEFUL INFORMATION.—Hints on Painting Old Woodwork; How Mirrors May be Ruined; To Restore Scratched Furniture; When to Apply Paint; Cloth of Tin; Archimedes and the Lever; Wagon Wheels; Whitening Smoked Walls, 87.

GOOD HEALTH.—Bruises and Cuts; The Best Medicine; The Heart and Its Diseases; Curing Discharge of the Ears; The Healthfulness of Lemons; Remedy for Painful Wounds, 87.

MISCELLANEOUS.—Forest Trees of California; Water Rights in California; Economizing Labor in Mills; Very Discouraging, 82. Notes on Taxation; The African Gold Fields; Artesian Wells on the Great Plains; Recent Contributions to the California State Mining Bureau, 86. The Calaveras Dams; Silver Mining, 87.

Business Announcements.

Wire Rope and Cables, P. E. Richter & Co., S. F.
Industrial Exhibition of Mechanics' Institute, S. F.
Mining Machinery, Rankin, Brayton & Co., S. F.
Coal, Oregon Improvement Company.
Giant Powder Company, San Francisco.
Dividend Notice, Standard Con. M. Co.
Dividend Notice, Silver King M. Co.
Assessment Notice, Bullion S. M. Co.

Passing Events.

Aside from what we have already noted in the "Mining Summary," on other pages of this number of the Press, there is very little of novelty in the mining situation. Everywhere the miners are hard at work on their claims Debris dams are being built now to restrain the heavier material from the gravel mines, and those engaged in hydraulic mining are more confident than formerly of the stability of their business.

In another column we give the details of the appropriations for the rivers and harbors of this coast, a matter of considerable interest to the engineeering profession.

The Denver Mining exposition opened this week, but California is, so far, unrepresented. Efforts are being made, however, and our State may yet make a fair display.

We publish this week a very large edition of the Mining and Scientific Press, circulating some 2,500 more than usual.

A good road leads from Sawtooth to Galena, Idaho, a distance of 18 miles. The route runs across the valley of the Salmon, and thence over a low pass of the Sawtooth range. This part of the road had to be made at a heavy cost, and is managed as a toll-road. Where it crosses the range an elevation of 8,800 ft. is reached

A few hopeful miners are still holding the fort over at Como, Nev. They deserve to strike a vein of pure gold with casings of solid silver.

The Denver Exposition.

The National Mining Exposition, at Denver, was duly inaugurated on Tuesday afternoon last, with ceremonies becoming to such an event. Special railroad trains brought in great numbers from the adjoining and distant towns, and there was also many visitors from abroad. Business throughout the city was generally suspended and the place wore quits a holiday appearance.

One of the chief features of the occasion was a large procession, which marched through the principle streets of the city. The Governor, most of the State and city officers, the various military and civil organizations and a large number of citizens and visitors contributed to make up a very imposing array. Nearly every military company in the State was present.

The literary exercises, which took place at the exposition building, were opened with playing "America," by the band, followed with prayer, and then "Hail Columbia," which was received with cheers. Many distinguished persons occupied the platform. Hon. W. D. Kelly was introduced to the vast audience, and delivered the oration of the day. At the conclusion of Judge Kelley's address, Hon. H. A. W. Tabor, President of the Exposition Association, in a brief speech, formally declared the exhibition open and started the machinery with his own hands. The stars and stripes were instantly run up on the main flagstaff, while a salute was fired by a battery stationed at some distance away. The utmost enthusiasm was manifested throughout by the 15,000 people in attendance, and the management considers that the success of the exposition is assured.

The dispatches to the daily press of this city report that on the second day the great majority of the mining displays were in position. The show of ores is represented as the finest ever known in the history of the world. Mining men are loud in their expressions of admiration, and predict the success of the exposition. Arizona, New Mexico, Utah and Montana ores are being rapidly got into shape, and present a most brilliant appearance. Exhibitors of mining machinery from New York show by their bills of lading that goods shipped in June have not yet arrived.

There is ample power to drive all the machinery entered. Gilpin county will show a large mass of fine gold ore, weighing about seven tons. The Argo smelting works shows over two tons of refined silver, and beautiful specimens of copper. The same works exhibit silver in every stage of refining. Their exhibit is valued at nearly $100,000. All the Idaho specimens are large, weighing from 50 lbs. upwards. There were several entries of California machinery. Eastern visitors were arriving freely.

The Commissioner for California has not yet left this city. He is still busily engaged, with some energetic citizens, in endeavors to secure "the ways and means" to forward a very fine collection of ores and minerals, which will be placed at his disposal as soon as the requisite funds are provided to handle them. If such means are not forthcoming within a few days, he will reluctantly be compelled to go on without an exhibit—a result which will tend greatly to the disadvantage and discredit of California.

Ore Concentration.

Ore concentration has been badly neglected on this coast. Attempts have been made here and there to concentrate ores before working them; but the failures, we imagine, have been more from ignorance or lack of skill than anything else. Concentrating ore is a process not to be learned in a day or a week, and because a few have failed, it is no reason others should not try.

Since the late improvements in concentrating machinery, concentrators are much more in use in mills than formerly; but as for concentrating large quantities of ore for shipment or for working, we do not hear of it. In Europe they pay much more attention to the matter than we do here, and with great profit.

Many districts on this coast are failures, for the simple reason that they have paid high prices for treating a lot of gangue that should have been eliminated in the first place. By raising the grade of the ore before beneficiation, it might be made to pay fair profits; whereas in prospecting the whole mass through, loss results.

Gradually, as mining is being reduced to a system and business, and the speculative feature is eliminated, we will find more attention paid to concentration. The day is fast coming when the benefits of a more general concentration of ores will be freely recognized among us.

About two-thirds of the freighters on the route between Lordsburg and Clifton, New Mexico, have drawn off, believing it unsafe to travel the road on account of hostile Indians. The Detroit Copper Mining Co., situated on the old trail from San Carlos to Mexico, at about six miles below Clifton, have been obliged to shut their smelter down, being unable to obtain teamsters to haul their ore. Mr. Church, the superintendent, has attempted to obtain from the military commander suitable protection for his reduction works, but without success.

Foundry Notes.

The Risdon Iron Works have just shipped a large hydraulic pumping outfit to Eureka, Nevada, for deep mining work. Mr. Moore, the superintendent of the works, is now at Eureka, seeing to the proper placing of the machinery. The pumping outfit is similar in design to that sent to the combination shaft on the Comstock, where it is now doing such good work, being run by water supplied by the city water-works. The new pumps and machinery are quite heavy. There is nothing fancy about them at all, but they are plain, substantial and strong. The system of hydraulic pumping, introduced here by the Risdon Iron Works, has proved so economical that it will be in use in many other places before long.

The Pacific Iron Works are engaged on considerable miscellaneous machinery and several water-jacket furnaces.

The Fulton Iron Works have recently completed a fine marine engine, which has been put in Capt. Simpson's steam yacht *Brisk*. The *Brisk* formerly belonged to W. C. Ralston. She has been practically rebuilt and given new boilers and engines.

The San Francisco Tool Works are engaged on orders for quite a number of machine tools of new designs.

Mr. W. T. Garratt has purchased the shop and tools belonging to the Richmann Drill Co., and will hereafter do the work of that company.

The Golden State and Miners' Iron Works are at work on the large dredging machine for the Panama canal, and have also considerable miscellaneous work on hand.

No machinery has been shipped from our city foundries to the Denver Mining exposition, as they are all too busy to make anything, except to order, and ordered material is wanted by the owners right away.

Steel from Beach Sands.

A great many experiments have been made, from time to time, with the beach sands of this coast, both to get the gold out and to extract the iron. Neither has been successful, to any great extent. D. W. Bolder and E. F. Russel, of this city, have, however, recently been experimenting with a method of making steel direct from the sand, and on a small scale; so successful has been their work that they are hopeful of very good results.

The principal feature of the new method lies in the peculiar flux, the component parts of which are kept secret. The sand is mixed up with this flux into bricks, like the "cierrae" of quicksilver mines, and then treated in a furnace.

We have been shown a bar of steel, purporting to have been derived from these sands by the process referred to; and it has been stated that large offers have been made to purchase the process. Efforts are being made in Oakland to establish works there, also. So far, what sand has been treated, has been melted in pots in a brass foundry.

On the north coast of Labrador there are large deposits of this magnetic iron ore sand. Steel has been made from this sort of sand at Quebec. The black sand deposits of this coast are large and extend for many miles. The deposit on Monterey bay beach is in some places three feet thick.

It is probable that before long some public tests will be made of the method of working the sands alluded to.

Mechanics' Institute Exhibition.

The annual industrial exhibition, under the auspices of the Mechanic's Institute, of this city, will open on the 15th inst. Mr. Culver, the Secretary, informs us, on inquiry, that it is expected the forthcoming exposition will excel any which has taken place. He says that already they are experiencing difficulties in allotting space, owing to the numerous demands of intending exhibitors.

These annually-recurring fairs have been of great usefulness to this city. They have directed the attention of our citizens and people of the interior to the home manufactures which have been established among us, and encouraged them to purchase the home-made in preference to the imported article.

The exhibitors have an opportunity of displaying before their customers the things they make in this city for sale, and these exhibitions are therefore first rate from an advertising point of view.

We are glad to know that this time the advantages were so well appreciated that no difficulty was found in having all the space properly filled. The new building is a fine, large one, and will be opened with suitable ceremonies.

It is better arranged than the old one was; the displays will be in more compact form. Mr. Culver says there will by many novelties this year.

If there are any who have neglected to apply for space, it will be well for them to see about the matter at once. It is probable that the building will be pretty well crowded.

Our Rivers and Harbors.

This coast fares better than it ever did before in the river and harbor appropriations. The total amount of money appropriated by the bill is $18,743,875, of which the Pacific coast gets $1,156,500, as follows:

Petaluma creek, California, completing improvements	$ 14,000
Sacramento river, California	250,000
San Joaquin river and Mormon slough, California.	40,000
Constructing canal around cascades of Columbia river, Oregon	265,000
Upper Columbia river, Oregon	6,000
Lower Willamette and Columbia rivers, from Portland, Oregon, to the sea, including bar at mouth of Columbia river	100,000
Upper Willamette river	5,000
Lower Clearwater river, Idaho	5,000
Cowlitz river, Washington Territory	1,000
Chehalis river, Washington Territory	3,000
Improving Skielaquamish, Nootsack, Snohomish and Snoqualmie rivers, Washington Territory, to build, equip and operate snag-boat for one year	20,000
Improving mouth of Coquille river, Oregon	10,000
For expenses of a Board of Engineers to examine in detail the mouth of the Columbia river, Oregon	7,500
Humboldt harbor and bay, California	40,000
Harbor at Oakland	200,000
Improving harbor at Wilmington, California	100,000
Improving entrance to Coos bay and harbor, Oregon	30,000
Improving entrance to Yaquina bay, Oregon	60,000

California receives of this the sum of $644,000. The bill, which was vetoed by the President, was afterwards passed over the veto, so it is now a law.

These appropriations are of great interest to the engineering fraternity, for employment will be given to a great many engineers in carrying out the works for which the money is given.

In the immediate vicinity of San Francisco, the Oakland harbor and the Sacramento river appropriations, are the most important, and the largest. Oakland harbor has now on hand, left over from the last appropriation, $75,000; so this makes a total of $275,000 for the work there. It is understood that a main part of this will be expended in dredging. The training walls are nearly finished. As soon as the litigation is ended work will be commenced on the canal to connect Oakland harbor with the Alameda basin. Then the depth will be maintained in the channel.

There is a great deal of engineering work to be done on the Sacramento river. All these works are carried out under the supervision of the U. S. engineer officers.

Mining Engineers.

Probably no profession has been so much injured by charlatans and quacks as that of the mining engineer's. In no other branch of business, probably, are there more people who profess to have knowledge and have it not, than in this. The number of individuals in the mining regions of this coast fortunate enough to be possessed of the title M. E., is something startling, and of late years has increased at a very rapid rate. We need many more mining engineers than we have, for there is always a demand for men of thorough, practical education and skill, to conduct our mines and metallurgical works. We ought to encourage, in every way, such men to come among us. They are greatly needed, and always warmly welcomed; but we do protest most earnestly against every surveyor or assayer who so pleases taking to himself the suffix M. E., and armed with this, misrepresenting a noble profession.

The title of "Mining Engineer" is conferred by a school of science, and indicates that the student has taken a full course of mining engineering and has graduated in the usual manner. No one is entitled to the name who has not fulfilled these conditions. Anyone may call himself "assayer," "surveyor," or "expert," if he chooses, but legitimately, he has no right to call himself "Mining Engineer." The degree is one conferred by an institution, not by an individual. Self-made men are all very well, but not self-made mining engineers. All of these quacks of the engineering profession should be exposed, like quacks of the medical profession.

The truth is, there are very few mining engineers. Our mining schools do not turn out many annually, and graduating classes of larger institutions are comparatively small, and people are more apt to get a spurious than a genuine article, unless they make a pretty close examination as to a man's right to the title.

It is not to be understood that a man is any the less competent to take charge of a mine, simply because his name has not these two added letters. If he has the fitness he will not find success impaired because he honestly refrains from taking what is not his own. In fact we want more honesty and a great deal less of cheek.

Calico.—The boys from this new excitement report that active mining operations are progressing slowly in the new El Dorado, and for quite a valid reason. The heat is from 118° to 120° in the shade, while in the sun iron tools become so intensely hot that it is impossible to handle them. So says the Inyo *Independent*.

It is said that there is gold enough in Snake river valley, Idaho Territory, to pay the national debt, if it could be saved. On thousands of acres it can be found with a common gold pan. But the gold is so light, that it escapes all known processes.

Recent Discoveries on the Planet Mars.

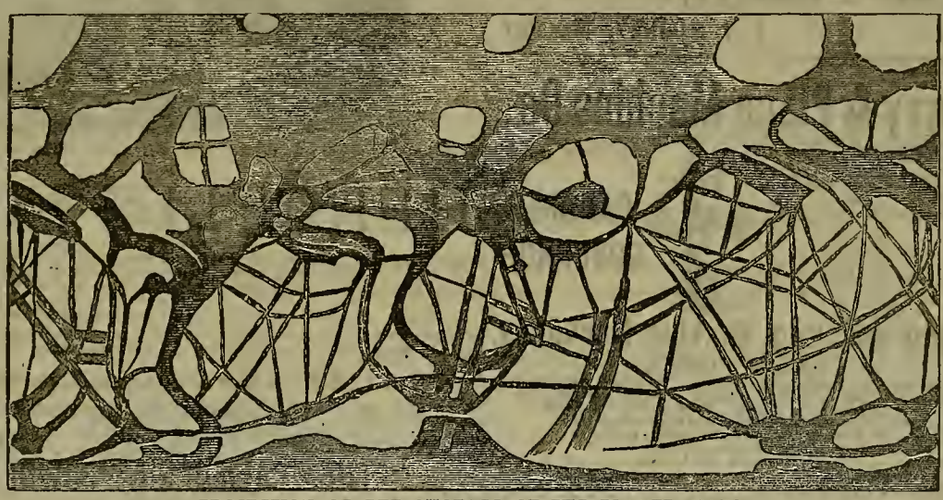
A cnrions discovery has recently baen made hy Sen. Schiaparelli, Director of the Royal Ohservatory at Milan, which may well start anew tha old question, "Are the planets inhabited?" This Italian astronomar has long been known as a most constant watoher of the planet Mars. In 1877-8 ha datected a nnmber of dnsky hands which traversa what appears to bs a region nf dry land, nomprising a wide aquatorial helt around that planet and separating its northarn and southern oceans, as shown upon the accompanying diagram. The next yaar, when the planet once more camo to a position favorable for ohservation, he again identified the same appearances.

Bot hia most ramarkahle discoveriea were made during tha months of Jannary and February last, when, under peculiarly favorehle oonditions, he noticed that these liner, or "canals," as they ara now called, began to become duplicated, as though the inhahitants of thet ruddy planet had suddenly hecome possessed with a mania for intarnal improvement in the way of new and dnplioate water ways. Several of those naw canals seemed to unfold themselves immediately under tha observer's eye, as he watched them from night to night.

Pending a more elahorate and detailed memoir of this remarkable discovery, the professor has poblished a short paner upon this interesting subjeot, which he rscently read hefora the *Academia dei Sincei*. The accompanying diagram was originally prepared for *Nature*, and has been taken from a photograph which accompanied tre paper, and hence may be considered subetantially correct, even in detail.

A discussion which recently took placo in the British Astronomical Society, as pnblished in *Nature*, snhstantiates strongly, hy independent evidence, the existence of these peculiar appearances npon cnr neighbor planet. It was suggested that some differences of opinion might be entertained in regard to them, hnt not as to the fact of their existence. It is stated that the atmosphere of Mars was peculiarly favorahle for observations while they were in progress.

The atatement is also made that some other remarkable changes hnve heen noted, partioularly a progressive enlargement of the "Kaiser sea" and the brightening of certain supposed large islands toward the northern and eouthern poles of the planet, as shown in the diagrom. Much interest is attached to these remarkable discoveries, and expectations are indulged in of diecoveries of still fnrther importance, not only from the extraordinary talent and diligence of the distinguished professor at Milan, with his present instruments, hut more especially by aid of the much larger telescope, with which rumor says that observatory is soon to he provided. It is to behoped that no time will he lost hy the Lick trustees in getting ready our own promised "largest telescope in the world" at Mt. Hamilton, from which, aided hy the pnre atmosphere of California and the great elevation of that observatory, it may reasonahly he expected fnrther and still more important disooveriee may be made, not only in regard to the physical condition of this peculiarly interesting planet, hut also in relation to that of the moon and many other astronomical objects.



PROJECTION OF THE SURFACE OF THE PLANET MARS.

Good Prospecting Ground.—The Greenville (Calaveras county) *Bulletin* says: Messrs. Williame, Davis and McIntyre, who went prospecting two weeks ago, continned their trip down the east hranch of Feather river ahout 35 miles on an air line, though the distauce traveled was over 55 miles. This region has heen very little explored, and still less prospected. For a distance of 40 milee along the river, the only milling ie hy two arastras, and even these are not worked vigorously; the rock is very rich. The men who own the claims are indolent, and when they have taken out a few hundred dollars, won't work any more while it lasts. Near this claim, on a peak called Arrarat, is an immense gravel deposit. At a hight of ahont 2,000 ft. ahove the river partiee are working ont the gravel hy sending it down the mountain side in ohntes, and washing it helow. Pieces of gold worth $100, or more, are frequently found. A large area of valuahle milling ground exists here, hoth placer and quartz. These prospectors have found three very promising ledges that prospected high. Locations were made, and the ledges will he thoroughly tested. The parties started out again yesterday, and intend to examine the country closely. All of them are experienced prospectors.

Although there are plenty of men in Wood River who are looking for work, yet it is said to he a difficult matter to find really good, experienced miners, and such are in demand.

The King of the West mining claim, in the Smokies, Idaho, has heensold to four Hailey operators for $20,000. The King of the West was located hy John McElhany.

Hints to Prospectors.

How to Determine Boracic Acid and Borax.

At the last meeting of the San Francisco Microscopical Society, Mr. H. G. Hanks, State Mineralogist, read the follnwing paper "On the Use of the Direct Vision Spectroscope in Prospecting for Boracio Acid and Borax:"

I call your attention this evening to a new and practical application of the spectroscope, which will prove especially interesting to those who seek new localities of borax.

Yon are, no douht, aware of ths importance to the Pacific coast, and to ths world, that the prodnction and shipment of horax has become. The importance of this nsefnl and rara mineral in California and Nevada is much greater than is generally known, outside the trade.

It is without the scope of this paper to give statistice of the production, hut I may say that it gives employment to many men, and large capital, and that prices have haen an rednoed that horax is now more extenoively used than before the important discoveries in Californis and Nevada.

All tho horax known on the Pacific coast is found in deposits, the exhaostion of which is only a question of time, and it is important that others should he fonnd to supply commerce in the fntnre.

It is well known to the practical ohemist and to the borax prospector, that the determination of horacic acid is attended with difficulties. It not only requires skillful manipulation, bot keen vision, to set free, and then to distingoish, the charaoteristio green color imparted to burning alcohol hy boracic acid, and specially so in the almost nniversal presence of sodium salts, which tinge the flame so strongly yellow as to mask any faint green color imparted by a small qnantity of horaoio acid. It is sometimes difficult to distingnish the color, even when the acid is present in considerable quantities.

In prospecting the deserte of the State there are no facilities for chemical operations, and the prospectors, generally poor, can hut ill afford to send their samplee to S n Francisco or pay the cost of chemical analysis. These consideritions have no douht retarded the development of the horax interests of the State.

All these difficulties may he overcome hy the use of the spectroscope. Thie convenient instrument, which I am indehted to Mr. Charles W. Banks, of this society, for the opportunity of showing you this evening, ie only three and a half inches long, and, with its case, may he carried in the vest pocket. Yet with it, a hottle of strong snlphuric acid, one of alcohol, and a small evaporating dish, the prospector, although unskilled in chemical handicraft, may detect with unerring certainty the presence or otherwise of horacic acid or any of its salts in the deposits he may find.

The operation is simple, and, once seen, is easily understood. The salt is placed in the evaporating dish, and a few drops of sulphuric acid added. A hrisk effervation generally takes place. The contents of the dish must he stirred, which may be done with a small stick, or anything convenient at hand. Alcohol is then poured in, in small quantity, and ignited. All that is then required te determine the presence of horax or horacic acid is to look at the flame tbrough the spectroscope. Two distinct and heautifully green hands will he seen if horacic acid is present.

If *free* boracic acid is contained in the sample, the green hands may be produced without the introduction of sulphuric acid. It is hest, bowever, always to use the acid, whicb decomposes the salt containing the weaker horacio acid, and to make a secondary test to prove the horacic ocic to he free or otherwise.

Whsn horacic acid is suspected in steam issuing from hot springs, it is only neoessary to condense a portion of the eteam. The resulting water is evaporated nearly to dryness at a *very gentle* heat; alcohol is then added and the flame examined as before. Thie test shows the preeence of boracio acid in the waters of Mono lake, and in the eruptive mud from the mud volcanoes of the Colorado desert, San Diego county.

The only weak point in this determination lies in its extreme delicacy. In inexperienced hands it might lead to the hope that ths sample was rich when horacic acid was present only in small quantities, hnt a little experience will correct this, for it will be seen that when the qoantity is small the hands are faint, and come and go in an intermittent manner; while, if the quantity is large, the bands aro distinct and well defined, and the color a clear green. As with tha sodium hand, the intensity of the color is an index to quantity—all of which may be learned hy experience. In making this determination all banda of other snbstances present, as lithinm, potassinm, etc., must be disregarded.

The instrument shown this evening is made by Browning, of London.

I desire to say that I will be pleased to show the method of using the spectrosoope to any person who will make application to the State Mining Bureau.

At the conclusion of the paper, Mr. Hanks made an experimont with Mono lake water, ahowing, by the nse of the pocket spectroscope, that it contained horacic acid. The green hands ahowing the presonce of the acid were very distinct snd prominent.

At the Durham (England) miners' annoal gala near that city last month, 45,000 people were present. The speekers generally addressed themselves to the condition of the coal trade in Durham and the present position of the miners, etc. Mr. Burt and nther epeakere stated the fact that at present there is sufficient work for all the minere in the Tyne and Wear—full and constant work; so that, looking at this fact, trade oannot he considered hod on the whole. Mr. Burt also stated that in 1870 the coal miners in the United Kingdom numhered 350,000, and in 1874 the nnmber had increased to 548,000. In 1878, 63,000 had left the mines, and in 1880 the number of miners were more than 50,000 helow what they were in 1874. He congratulated the miners on the recent adjustment of the sliding scale, and advised them to support it hy every means in their power.

Galena, Idaho, ie a very quiet place, hut there is eo much promise in the mines of this locality that Galena is destined to become a good, lively mining camp. Ahout 150 men are employed in the immediate neighhorhood. There are two etores, four saloons, four reetaurants, two lodging housee, one butcher, one hlacksmith and shoemaker shop. This is the extreme upper end of the country known as Wood River, and the town lies at an elevation of 7,400 ft. above the sea level. The houses are mostly huilt of logs, and made strong enough to withhold the heavy fall of snow there during the winter. There are numerous prospects, and some good mines.

The hullion ehipments from Bodie for the firet six months of 1882 were $1,074,490.11. These ehipments were made hy the Standard, Bodie, Noonday, North Noonday, Syndicate and Bodie Tunnel mines, and from transient sources, including placers, etc. The entire bullion shipments from Bodie district from the commencement of operations in 1877 to the 30th of June, 1882, are as follows: 1877, $979,022.80; 1878, $2 129,732.58; 1879 $2,556,847 58; 1880, $3,063 699.13; 1881, $3,173,000.00 First half of 1882, $1,074,490.11; Total $12,976,792.20.

Imprisoned Toad.—Here comes that imprisoned toad again; this time the Homer *Mining Index* finds him, saying: A common toad was found packed under a large honlder 35 ft. heneath the surface, in the Lone Tree shaft of the Lee Vining Creek Hydraulic Mining Association a short time since. When released he skipped ahout as nimbly as if he had heen feeding on flies instead of having heen huried for perhaps thousands of years.

The Belcher and Crown Point companies are now daily oxtracting ahont 200 tons of ore. This is not old fillings or low grade, hut good milling ore, though it comee from the old upper levels. It is heginning to look as though they had got into a hack ledge.

Contributions to the Geology and Mineralogy of California.—No. 6.

[New series.]

Occurrence of Tin Ore (Wood Tin) in California, Idaho and Montana.

By Wm. P. Blake.

H. G. Hanks, State Mineralogist, California:

In contribntion No. 1, I made brief mention of the occurrence of stream tin in the alluvions of the Middle Fork of the Feather, ahout three miles above Big Bar, in Plumas county. Tha only evidence so far found is a single specimen saved and shown to me for determination, by Mr. Thomas Lane, of Laporte. This observation becomes more interesting from the discovery of eimilar ore in Idaho and Montana. On visiting northern Montana, last winter, I was enrprised to find that streom tin occurs in many of the streams of the granitic region of the Bitter Root mountains, and in some localities in sufficient ahundance to jostify the hope that washing for this ore may he conducted with profit. At Glanoy, in Jefferson coonty, not far from Heleoa, the mineral occurs in the creek, and is washed out hy the placer miners. At Dr. H. M. Hill's, at thie place, I saw about 100 pounds, some of which was taken from Prickly Pear oreek, on the Snake. This oro is in small, ronnded, light-hrown grains, about the size of peas or kernels of corn. It is accompanied hy wolfram and hy white hrilliant oryatals of topaz, like those with the Durango tin. There are other gems, in a broken fragmentary atate, looking like sapphire and aqua-marine and like zircons.

Amongst other localities where tin ore hos heen found I cite: French Bar, ahoat 18 miles from Helena; at the head of Ten Mile, in the "Basin;" and in Basin gulch. Recently I have received a sample of fine quality from Mr. Benjamin Franklin, of Deer Lodge, Montana, who washed it out some years ago from Peterson creek. This creek heads in the main range and flows a short distance in a southwest and then in a northwest direotion, and empties into the Deer Lodge at the sontherly line of Deer Lodge City. The locality is abont 10 miles southeast of Deer Lodge City. The country rock in the vicinity is granite. It is said to have heen found also across the Missouri, ahove Fort Benton, and, at the other extreme, near Salmon City, on the Snake river, in Idaho. It will he remembered that in 1866 I directed attention to the faot that stream tin had hsen found in heautiful hrown masses on Jordan creek, Idaho Territory, in the placers of that stream.* Thie ore is identical in its appearance with the Montana ore, and neither can be distinguished from the Mexican specimens.

The many points at which the ore has been found in Montana and Idaho indicate that thie importnnt ore has a wide ond general distribution in the granitic region of the Northwest, particularly in the Rocky mountains, at the headwaters of the Missouri and in the western drainage, including the streame flowing from the Bitter Root range, especially in the Snake and the Salmon, and their affluents.

It should be added that at the International exhihition, Philadelphia, 1876, Dr. Hill exhihited a har of metallic tin about six inches long, two inches wide and one inch thiok, whioh he reduced from Montana ore. In the wealth nf objects exhihited at that time this little har did not receive the attention and mention to which it was entitled, as representing a possihle metallurgical indnstry of great importanoe to the nation. It is premature to say that any of the localitiee noted will yield the ore at a profit sufficient to justify working for the tin ore alone, hut it is possible that such placos may he found. Most of the placer minere are ignorant of the nature of this ore, and do not recogniza oxide of tin in the smooth and hard stony fragments that load their sluices and pans, and are thrown out as valueless. It is, therefore, important to direct attention to these localitiee and to the ore. The distribution of the stream tin should be more accurately determined, and search should be made for the parent veins in the mountains at the points above where the deposits of tin commence. As this notice may be published in the Mining and Scientific Press, which deservedly has a wide circulation amongst the miners of the West, it is well to add that the wood tin, as found in Montana and Idaho, is in very smooth and heavy grains and masses of a light hrown and also a dark brown color, with a concentric layering and a fine radial structure. It is as hard as quartz, as heavy as pyrites, and contains ahout 78% of tin, though it is without any metallic luster or appearance.

W. P. Blake.

Mill Rock, New Haven, July 10, 1882.

* "Catalogue of Minerals found in California and adjoining States and Territories," p. 9.

From the Contention mine the usual amount of ore is being shipped to the mill on the river. Ten stamps of the Girard mill are still pounding away at Contention second-class. There is still ahout 10,000 tons of the latter on the dump.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Leal Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupellation Furnaces, Market Kettles, Wire Rope Cages, Bucketa Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.

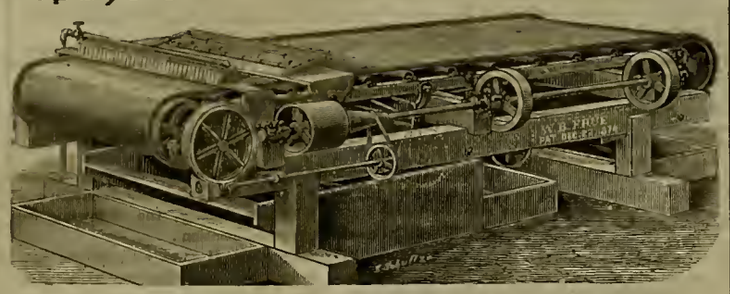
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.
☞ A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.
ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞ Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

Cream of Tartar.

Its Production and Uses.

Few industries on this coast have a greater future than the wine interest, which is already a prominent feature in our exports. It is necessary, of course, that every thing in connection with the wine should be utilized, as it is only in that way that our wine growers are enabled to compete with foreign producers, whose economy and thrift are so widely known.

Only a few years ago we were entirely dependent on foreign manufacturers for our supplies of cream of tartar, which is manufactured from argols developed in the manufacture of wine. Until within a short time, the wine makers on the Pacific coast cast the argols aside as being of little or no value. The establishment of manufactories which utilize this product is rapidly freeing us from our dependence on importations. While cream of tartar is used for numerous purposes, still, the larger proportion is used by baking-powder manufacturers, and there is certainly no reason why California, with its facilities for producing argols, should be dependent upon the East or Europe for supplies.

We recently called upon Messrs. A. Schilling & Co., the proprietors of the Pioneer Baking Powder Company, by far the largest consumers of cream of tartar on this coast, and, in a conversation with their chemist, in reference to what constituted a pure baking powder, we learned that cream of tartar and bi-carbonate of soda are the only ingredients that should be used in the manufacture of baking powder. To have the baking powder perfect, it is necessary to combine the cream of tartar and soda in such a way that the ingredients will neutralize each other, thus giving the proper action to them and producing the largest amount of carbonic gas necessary for baking purposes. To what extent the success of the baking powder depends on the proper combination of the two materials was proven to us by his having other baking powder, put up by other firms, which, although containing cream of tartar and soda only, did not develop the full amount of carbonic gas. This was owing, no doubt, to the excess of bi-carbonate of soda used; but whether this was due to the firms not being able to enjoy the services of a competent chemist to superintend the combination, or whether it was merely because cream of tartar being high in cost, while bi-carbonate of soda only costs one-sixth as much, was hard for us to determine.

We believe that home industries should be encouraged; the more it is done, the better it is for this coast; and institutions that are promoting home enterprises should be encouraged as long as they use legitimate means to increase their business. For this reason we sought Messrs. A. Schilling & Co., to get information in reference to the supply and demand of cream tartar.

The effrontery and mendacity of some large Eastern companies in introducing to the people on this coast, baking powders which contain a large percentage of starch, and endeavoring to push them on the innocent public by means of glaring advertisements and tricks deserves the condemnation of every right-thinking person.

When any portion of the cream of tartar and soda, which are necessary for the production of carbonic gas, are removed, it is absolutely necessary to replace it with some material possessing the power to produce the same effect. One of the most common articles used for this purpose is ammonia. It is a well-known fact that carbonic gas is produced in nature in many ways.

There is hardly a child that has not noticed the bloated condition of animal carcasses. This condition is due to the action of the ammonia in the animal developing carbonic gas, which causes the bloated appearance of the carcass. Ammonia being a product of organic decomposition, it is not a very nice ingredient in bread making, though, unquestionably, a very powerful gas producer. The manufacturers of baking powder, composed entirely of cream of tartar and soda, only, cannot compete with powders composed largely of starch and containing so powerful and nasty an element as ammonia, nor can they indulge in high-priced advertisements in praising the merits of a so-called "absolutely pure" baking powder. To persons desirous of informing themselves in regard to ammonia, we would refer them to the "United States Dispensatory," folios 112 and 114, where they will find a detailed statement of what it is obtained from, the details being unfit for publication here. We are certain that the public cannot be aware of the uncleanness of ammonia, or they would be more careful to avoid the use of baking powders that contain it.

A certain Eastern baking powder company has constantly kept its brand before the public, and has styled it as being "absolutely pure," and has recently published an elaborate diagram showing the strength of the different baking powders produced by large firms in the United States. These diagrams are being published broadcast over the country. This company manufactures a baking powder containing a large percentage of starch, and they use ammonia to replace the strength lost by the removal of the cream of tartar and bicarbonate of soda.

We are informed that this company has spent a very large amount of money in advertising their baking powder, and have taken pains to maliciously slander other brands that undoubtedly have more merit. The large profit made by this company, no doubt, justifies them in expending so much in advertising so extensively, while manufacturers on this coast, who are giving better value, and endeavoring to aid the industrial interests of the State, are not in a position, on account of the small profit they are making, to keep their brand of baking powder before the public in newspapers. These Eastern firms, however, are selling an adulterated article, and advertise on the principle that the party making an excessive profit can do more "blowing" than manufacturers of a better quality whose limited profit does not permit them to enjoy extensive newspaper advertisements. As a rule, houses putting up fine goods care but little for slanderous utterances, as they return, "boomerang"-like, to the injury of the originators. The "barking" of rivals, who are selling their goods as patent medicines are sold, can easily be answered by facts, and we understand that the manufacturers of a superior article of baking powder propose publishing the analysis of the baking powder offered by these parties, showing what their powder contains, if they persist in running down brands that they know are better than their own. Sworn statements of prominent chemists will soon explode their claim of selling an absolutely pure baking powder; but we will drop this baking powder subject until some future time when we can devote more space to it.

Cream of tartar is used to some extent for medical purposes, and there is also considerable consumption of it for cooking purposes, aside from its use, combined with bicarbonate of soda, as a baking powder. To all consumers who appreciate a pure article the development of its manufacture at home is a matter of interest.

We will, at some future time, endeavor to give our readers a full account of the manner in which cream of tartar is developed in wine making, and the processes through which it passes after leaving the wine maker's hands.

News in Brief.

THE proposition to issue two-percent bonds has been unfavorably reported.

VIRULENT yellow fever at Metamoras, Mexico. It is feared that it will enter Texas.

A TWELVE-YEAR OLD boy in Missouri kills his father and is found guilty of murder.

ENGLAND, says Dufferin, is forced to take the responsibility of action in Egypt to restore order.

GERMAN men-of-war are ordered on no account to land troops in Egypt, but to receive German citizens.

THE motion in the House of Commons for a vote of credit for the Egyptian expedition was carried by 275 to 19.

IT is reported that the De Lesseps Panama canal is being pushed forward with energy, and prospects of early success.

THERE is no more than $4,500,000 of unused appropriations to the credit of the River and Harbor fund from last year's bill.

THE Senate increased the appropriation for the new dry dock at Mare island to $300,000, and directed that it be built of granite.

A COLLISION on the Lake Shore railroad, near South Bend, Ind., caused the burning of 60 cars and the death of seven tramps.

INDIANS to the number of 1,000 lately met near the month of Rock Creek, W. T., to have what they called their Fourth of July, which lasted several days. It consisted of feasting, dancing and horse racing.

THE executive officers of the Brotherhood of Telegraphers of the United States and Canada, and the United Telegraphers of North America held a conference in Cincinnati, Saturday, and effected a complete consolidation.

A DISPATCH from Nutt, N. M., says: Great excitement was caused in this vicinity by the discovery of new deposits of extraordinarily rich silver ore at Lake valley, 10 miles from here, in the Black range. In one shaft of the Sierra mine, a vein of chlorides and horn silver 40 ft. thick has been disclosed this week. The influx of prospectors is so large that hostile Apaches, who committed numerous outrages here last year, have fled from their camps and gone over the border. The Atchison, Topeka & Santa Fe railway has laid out a branch road from here to Lake valley, and the rush to the new mining district increases daily.

Proof of the Pudding.

Any housekeeper who so wishes, can satisfy herself as to the merits of different baking powders by a simple practicable test. Make two batches of plain cake—one with the New England Baking Powder, and the other with any other brand she desires to compare with it. When baked, put away for two days and then taste both. A lady states that she tried this, and the result was the cake made with the New England Baking Powder was moist and quite as palatable as if perfectly fresh, while the other was dry, crumbly and unfit to be eaten. It is useless to argue against facts. A powder composed only of cream of tartar and soda rightly combined is the best to use. Those adulterated with ammonia and other "modern improvements" may appear to do the work, but the bread, cake or biscuit made with these rapidly deteriorate, and certainly cannot be healthy. * *

A FINE body of ore was discovered in the west drift from the second level of the Ingersoll mine, Tombstone a few days ago.

UNUSUAL activity prevails throughout Tombstone district.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR THE WEEK ENDING JULY 25, 1882.

261,653.—GRAIN CLEANING APPARATUS—T. S. Bayley, Chico, Cal.

261,667.—MAGAZINE FIRE-ARM—J. M. & M. S. Browning, Ogden, U. T.

261,672.—SANITARY STEAMING STOVE—H. Cartwright, Portland, Oregon.

261,700.—DIRECT-ACTING STEAM PUMP — John Gates, Portland, Oregon.

261,744.—CARRIAGE BRAKE — Angus McKellar, Fort Douglas, U. T.

261,759.—DIRT SCRAPER—Jas. Porteous, Fresno, Cal.

261,773.—BLIND BRIDLE—Joseph C. Simpson, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

WATCH OILER AND HOLDER.—Ferdinand Gundorph, Portland, O. No. 261,340; Dated July 18th. This invention relates to a device for oiling watches and other minute mechanisms, and a holder in which it may be protected, and by the peculiar construction of which it may be easily removed when desired. The holder has a horizontal channel, which conforms to the shape of the tube to a point near the head, and thence it widens out, so that for a short distance the head or stopper end projects from the channel into this enlarged space. The space is deeper than the channel, so that by pressing on the end of the oiler, the opposite end may be tilted up, and it may be removed for use.

GRAIN CLEANER.—Thos. S. Bayley, Chico, Butte county. No. 261,653. Dated July 25, 1882. This invention relates to an improvement in machines for cleaning grain after it has been thrashed. It has a hollow rotating screen having depressions formed at intervals in its length. No blast passes through the cylindro-conical section. It is light, durable, and has great capacity. It is specially adapted for grading grain after it has been cleaned by the ordinary screens of a cleaner, as, by a proper construction of the meshes, the smaller grain and cheat may be perfectly separated from the best in the different sections.

SHOE.—Loo Chew Fan, S. F. No. 261,439. Dated July 18, 1882. This improvement in shoes consists in the formation of the uppers in a single piece each, their edges coming together in front without overlapping. The tongue extends down inside the butt seam, and an ornamental tip extends up over the outside, both being stitched in place, so that an easy fit for the foot is made at that point.

For Sale.

A twenty-stamp steam mill, complete and almost new. Also, air compressors, drills and mining machinery. Anyone having a gold or silver mine warranting the investment, may buy this material on time by making monthly or quarterly payments. Address, CHARLES E. SHERMAN, Havilah, Kern County, Cal.

Back Numbers Wanted.

We will pay 10 cents a copy for the following numbers of the MINING AND SCIENTIFIC PRESS: Volume, 13; year, 1866; number, 1. Volume, 18; year, 1869; number, 5. Volume, 20; year, 1870; numbers, 1 and 26. Volume, 22; year, 1871; number, 1. Volume, 30; year, 1875; numbers, 2, 3, 4, 7, 10, 11, 12, 13 and 15.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

A TURNED LEAF will point out the article supposed to be of special interest to persons receiving sample copies of this paper.

Mining and Other Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

Bullion Silver Mining Company.—Location of principal place of business, San Francisco, California; location of works, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given that, at a meeting of the Board of Directors, held on the first day of August, 1882, an assessment (No. 25) of Fifty (50c) Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 3, No. 328 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fifth day of September, 1882, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 27th day of September, 1882, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. M. BRAZELL, Sec'y.

OFFICE—Room 3, No. 328 Montgomery street, San Francisco, California.

Seaton Gold Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Drytown, Amador Co., California.

NOTICE.—There are delinquent upon the following described stock, on account of Assessment No. 1, levied June 6, 1882, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. of Certificate.	No. of Shares.	Amount
Martin, A. (Trustee)	8	5000	balance, $200.00
Martin, A. (Trustee)	9	5000	750.00
Martin, A. (Trustee)	20	500	75.00
Martin, A. (Trustee)	21	500	75.00

And in accordance with law, and an order of the Board of Directors, made on the 6th day of June, 1882, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at 523 California St., Room 6, San Francisco, Cal., on Wednesday, August 16th, 1882, at the hour of 4 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expense of sale. A. MARTIN, Sec'y.

OFFICE—Room 6, 523 California St., San Francisco, California.

WATER JACKET SMELTING FURNACES
—FOR—
Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.

PREPARATION
FOR THE
MASSACHUSETTS
INSTITUTE OF TECHNOLOGY
Is a specialty at **Chauncy-Hall School,** Boston, Mass., and its remarkable success can be ascertained from the Chairman and Secretary of the Faculty of that celebrated institution.
It aims to fit its candidates so thoroughly that they will not be weighted by "conditions" to be made up after entering.
The School is within two minutes' walk of the Institute, affording unequaled opportunities for consulting the professors.
It is also very near many of the most elegant buildings in Boston.
HEALTH receives unusual attention. MILITARY DRILL under competent officers.
Chauncy Hall has annually sent classes to
COLLEGE
For nearly fifty years, and has had but one certified candidate rejected.
THE BUSINESS COURSE
Gives such a generous culture as fits a young man to take a high rank as a merchant.
This is the **oldest and largest** private school in Boston.
The fifty-fifth year will begin Sept. 13th.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

Pacific Iron Works,

SAN FRANCISCO.

California Wire Works,

(Successors to A. S. HALLIDIE,)

6 California St., San Francisco.

—o—

WIRE ROPES AND CABLES,

Manufactured at our works, guaranteed to be equal in quality to any made, and as cheap, for

MINING AND SHIPPING PURPOSES, ETC.

Wire Suspension Bridges and Aqueducts.

WIRE ROPE

WIRE TRAMWAYS — FLAT AND ROUND — CABLE RAILWAYS

WIRE

GALVANIZED & PLAIN

California Wire Works,

(Successors to A. S. HALLIDIE),

6 California St., San Francisco.

—o—

WIRE OF ALL KINDS,

Manufactured at our Wire Mills in this city, superior to any imported, for

Telegraph, Bailing and Fencing, etc.

WIRE STAPLES AND WIRE NAILS.

Wholesale and for Export.

EMERY WHEELS and GRINDING MACHINES.

The Tanite Company.

STROUDSBURG, MONROE COUNTY, PA.

EX INUTILI UTILITAS — TRADE TANITE MARK

Orders may be addressed to us at any of the following places at each of which we carry a stock.

SAN FRANCISCO, CAL.
Nos. 2 and 4 California Street.

PORTLAND, OREGON,
No. 43 Front Street.

CHICAGO, ILLINOIS.
Nos. 152 and 154 Lake Street.
And 40 Franklin Street.

ST. LOUIS, MISSOURI,
No. 209 North Third Street.

ST. LOUIS, MISSOURI,
Nos. 811 to 819 North Second Street.

1851. 1881.

DEPUTY U. S. MINERAL SURVEYOR

Surveys for Location or Patent. Maps and Plans Drawn Mining Properties of all kinds examined and careful reports made of the same. Consultations on Mining Investments. Address, THOS. W. REEDE, CIVIL ENGINEER, Oroville, Butte Co., Cal. References given and required.

C. E. CASE, M. D.,

Consulting and Operating Physician,

1116 Broadway Oakland,

Will visit patients at a distance for consultation or to perform operations.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS.

☞ Send for Pamphlet showing methods of testing the different qualities of all Powders.

The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT, No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." It is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is **STRONGER THAN BLACK POWDER,** having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

CALIFORNIA VIGORIT POWDER CO., **ENGLISH & WRIGHT, Agents**

No 327 Pine St., San Francisco.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, AUGUST 12, 1882. VOLUME XLV Number 7

Mechanics' Institute Pavilion.

We give on this page an engraving of the new building in which the Mechanics' Institute Industrial exhibitions will hereafter be held. The building will be formally opened on Tuesday, the 15th inst., when the opening exercises of the Seventeenth Industrial Exhibition will be held.

The new building fronts on Larkin street, and extends along the block fronting on Grove St. The doors are only a few steps from Market street, near the new City Hall.

There has been an attempt made at architectural display in the construction of this building, though it is neat and plain in design, and very strongly built. It is not quite so large as the building in which so many fairs have been held, being somewhat shorter. It is 412½ ft. long and 200 ft. wide, with a garden 45 ft. wide by 300.

There is also in the rear, and separated from the main building by a partition, a machinery department 200x66 ft. and 21 ft. high.

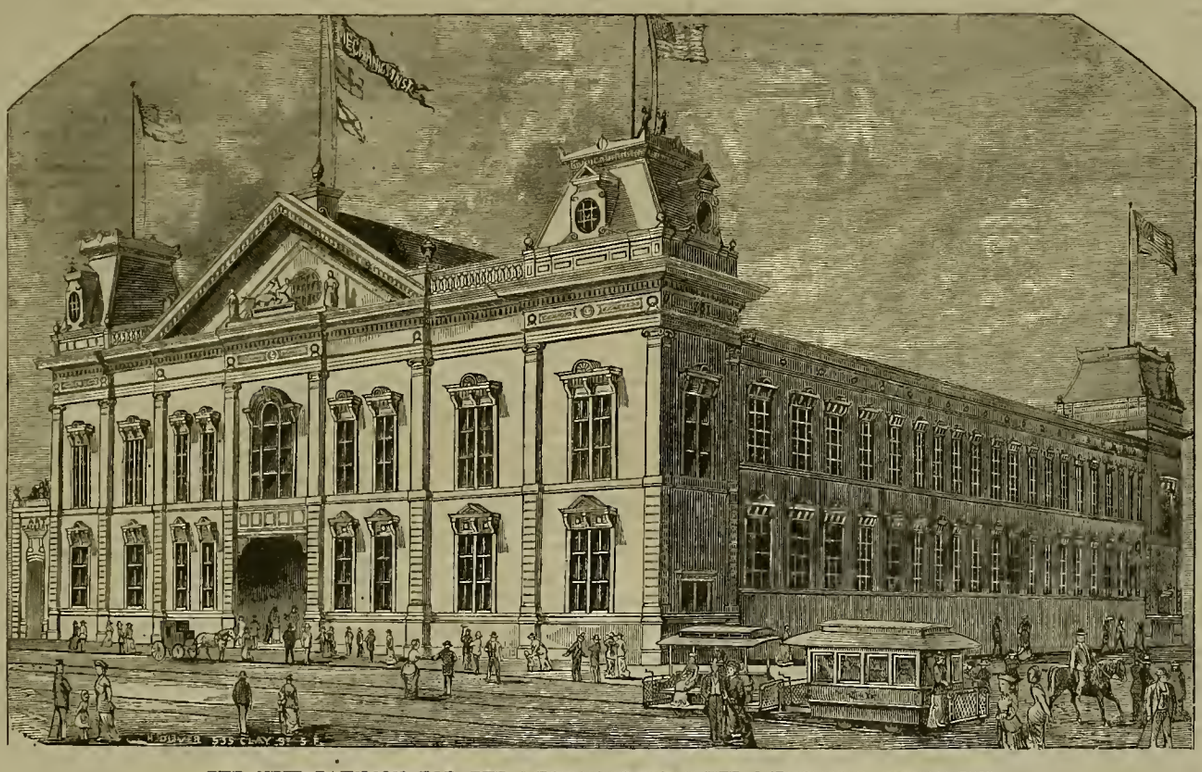
The garden is open to view from the main floor, which is a great improvement. The top of the horticultural department is covered with glass, giving plenty of light and making it warm.

The main floor is planked with smooth narrow planking, so that walking will be much easier.

The main features of the old building have been preserved, as all the material has been utilized in the new one. Avery great improvement, indeed, has been made in whitewashing the rafters, arches, etc., so that the building is much lighter than the old one.

The galleries are the same as we have been accustomed to see them. The art gallery is divided into four rooms, separated by folding doors, so that one or more rooms can be leased to parties, clubs, etc., when the fair is not open. These rooms are hard finished, and look very well. There is a separate entrance to these rooms.

The whole building is light and airy. There are two good staircases at each end of the building, and the toilet arrangements are a great improvement. There is no shafting under the main gallery, machinery in motion being confined to the machinery room.



THE NEW PAVILION FOR THE MECHANICS INSTITUTE INDUSTRIAL EXHIBITION.

Chrome.

In many parts of this State chrome iron is found, but the transportation facilities are not always good, and in very few places is it utilized. The mines at San Luis Obispo, five miles from the town, on the line of the San Luis Obispo & Santa Maria railroad, are the most prominent. From them many thousand tons have been shipped. Some three years since, chrome iron was found about seven miles east of Iowa Hill, Placer county. The ore, which is of good quality, is found in irregular masses, disconnected and imbedded in the country rock, and varying in weight from a few pounds to several hundred tons. Since this discovery, the mining and shipping of chrome ore from Placer county is becoming an important industry. Large shipments are made from Auburn regularly, the ore coming from points on the Forest Hill and Georgetown divides; also a great deal is being shipped from Colfax, being brought over from what is known as Brimstone plains, a few miles above Iowa Hill. The Smiley brothers are the principal shippers from the latter point. Chrome deposits not yet opened are known to exist in other places in the county.

The process for the manufacture of bichromate of potash requires the skill of people accustomed to chemical operations on a large scale. The usual result in weight that may be looked for from 2,000 lbs. of chrome iron, of 50% oxide of chromium, is 1,600 lbs. of bichromate of potash. The chief use of bichromate is in the dyeing or the production of the variety of colors and pigments in which chrome plays such an important part, and in charging batteries for telegraphic purposes.

Chromic oxide is largely used by the Government in printing greenbacks. Chrome iron is also used for making chrome steel, used for machine tools in many of our city foundries.

If works were erected for the reduction of chrome iron here, other products would be necessary. The treatment of chrome iron, as described by the State Mineralogist, is as follows:

First, the ore is very finely pulverized, sifted, or bolted, and placed on a reverberatory furnace with salts of potash, and the heat continued until the chrome ore is decomposed and the chromic acid combines with the alkali, forming crude bichromate of potash. This is raked from the furnace on a brick floor, and when cold is leached with water in a suitable tank, which extracts the soluble bichromate of potash, and from which all the chrome products are obtained.

Its manufacture depends upon a supply of potash, which cannot be obtained on this coast, and must be imported. This would probably be fatal to its manufacture here. Other alkalies, such as soda of lime, might be substituted for the potash, but the only gain in that case would be the concentration, as it would nearly all have to seek a market elsewhere.

It is my opinion, that if the manufacture of chromic products should be undertaken, the first works should be small and experimental, otherwise great loss of money would result, even should success eventually follow.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening last, Vice-President J. P. Moore in the chair, and a large number of members present.

E. B. Rail and Miss Nellie G. Sanborn were proposed for membership.

A letter was read from Mrs. E. B. Crocker, of Sacramento, presenting to the Academy her very rare and valuable collection of 1,500 birds and 100 mammals. The collection consists of specimens from all parts of the world, some of which are not found in the British museum, all of which are mounted, classified, suitably labeled and arranged in glass cases beautifully prepared to contain them. On motion of Hon. B. B. Redding, a committee, consisting of Dr. Albert Kellogg, Wm. F. Meyers and Charles G. Yale, was appointed to return suitable thanks to the generous donor for so valuable and welcome a gift, and for the kind interest thus manifestly displayed in the prosperity and usefulness of the Academy. It was resolved that the collection be known as "the collection presented by Mrs. E. B. Crocker, of Sacramento." The collection is valued at $12,000.

The principal interest of the evening was in the report on the footprints found in the quarry at the Nevada State prison at Carson. Some time since Mr. C. D. Gibbes, curator of mineralogy at the Academy, received word of these interesting relics, and immediately he undertook the task of examining into them. After endeavoring for some time to get some one to accompany him to the spot, he finally got Dr. H. W. Harkness to consent to go. Both gentlemen went under the auspices of the academy. Mr. Gibbes made accurate measurements and drawings, some of them in full size, and also had photographs of the footprints and surroundings made. Dr. Harkness made plaster casts, and on their return a paper describing the joint labors of the gentlemen was prepared and read by Dr. Harkness at the last meeting. This paper is too long for us to publish at this time. It was very complete, and was accompanied by diagrams, drawings and photographs. The expenses of the expedition were paid out of the income of the "Crocker Scientific Investigation Fund," recently donated by Charles Crocker. A shorter paper on the same subject was read by Mr. J. R. Scupham, of the C. P. R. R., who also visited the locality. This we give in another column.

THE NORTH END MINES.—John W. Mackay informed a Virginia *Chronicle* reporter that he intended to remain on the Comstock for a month, at least, and might remain for two or three. He said that Superintendent Patton would go East for a month or two on a vacation, and during that time he (Mr. Mackay) would personally superintend the operations at the north end mines. The report of Colonel Oshiston coming there is not true, as the Colonel has business in Colorado, where he is at the present time.

FEMALE MINERS.—The Bodie *Free Press* says: The Piutes hereabouts have more money than the balance of the tribe in other places. Up here the squaws put in a good deal of time washing gold, and they take out a good deal of money. Captain John says that his wife cleaned up $15. Some of the other squaws are equally fortunate. On Sunday a buck and his mahala left for Washoe, having in their possession 10 ounces of gold dust that will sell for at least $14 per ounce. Poker games are constantly running, and there is no lack of whiskey for those who are inclined to be intemperate. Captain John says that Bodie is the boss place.

THE Grantsville *Bonanza* says that mining operations in Nevada are in anything but a flourishing condition, and the trouble is there is very little sign of any improvement. In Nye county there are quite a number of valuable mines lying idle for want of capital to develop them.

Two men, while attempting to climb over the railing of the Tuileries gardens in Paris, during a display of fireworks on Monday night, caught hold of an electric wire used in the illumination of the grounds, and both were struck dead instantly.

Silver City.

A Peaceful and Prosperous Camp.

The people of Siver City appear to have settled down as a community hy themselves. They no longer allow themselves to he agitated hy the doings of stock hoards. They flourish

"Unhurt amidst the war of elements,
The wrecks of matter, and the crush of worlds."

They have settled down to make the most of that which is at hand. Having ceased to aspire to the development of honanzss, rivaling the famous ones of the Comstock in its prime, they now look only for that which will pay, even though the deposit is one that can yield hut a few tons of ore. They gather in the pay wherever they find it, and as long as they find it, when they continue the search in nsw fields. They go after ore somewhat after the fashion of the "trihuters" in the eastern part of the State, hut very few of them pay trihuts to any one. What they find is their own.

The little water-mills down along Gold canyon are a great convenience in this kind of work, and they are kept husy on small lots of ore. Where parties have large lots of ore or where they wish to sell out at once, they can find a purchaser in the Lyon mill and mining company, at Dayton.

Devil's Gate district is on the surface a perfect network of quartz veins, from a few inches to several feet in width, and all these contain more or less gold. It is not necessary to go down to the depth of several hundred feet to find this gold. In most places it is found from the stsrt, and almost on the surface. A vast deal of good pay hss heen obtained in that section that hegan at the "grass roots." Most of these places were worked in the early days, hut in and ahout them are still to he fonnd stringers and hunches of good ore, and not unfrequently these lead to new deposits.

By many it is supposed that these veins that show so much gold at the surface of the ground are hut the feeders of a great mother vein hidden at great depth, and that this main vein is silver-hearing. This may be correct, as we know that at Gold Hill all was for a long time worked for gold alone, and it was not nntil a depth of several hundred feet had been attained that the silver ore came in. However it may he, the people of Silver City are now going for a sure thing, and in doing this they may eventually he lead to great discoveries in their camp. The section of country ahout Silver City has heen less prospected at depth than any other in this part of the State, and most of the deep work done there was done in the wrong places. What is wanted there is a hig shaft to the eastward of the town, on Nigger ravine, in order to prospect the flst on which the town stands, and which is fnll of feeders of quartz, all of which contain more or less gold at the very surface of the ground. Even the soil prospects well in gold, and along Nigger ravine more or less placer mining has heen successfnlly done for the past 20 years.—*Virginia Enterprise.*

Prospect Mountain Tunnel.

We hear excellent reports from the Prospect Mountain tunnel. It is reported that a valuahle find has heen made—a 12-foot hody of ore assaying, from the poorest to the hest, from $10 to $150 per ton. A number of seams or stringers have been passed through which look favorahle for prospecting. No prospecting has heen done, however, the tunnel heing pushed ahead without stop until it is now in 2,025 ft. We understand that it is the intention of the stockholders to extend the tunnel ahout 500 ft. farther, at which point it will be 1,500 ft. down vertically from the apex of the mountain. When the tunnel has heen completed 2,500 ft., the work of prospectiug and exploration will hegin. It is expected that the tunnel owners will he ahle to hond certain properties which can he readily worked through it as an easy and cheap outlet for their ores. The Avon, the claim to which the 12-foot hody of ore mentioned belongs, has heen honded already hy one of the tunnel company, Hon. Thomas Wren, which bond will he transferred hy him, without charge, to the company. The tunnel will pass under some mines, the Silver Connor and Matamoras, for example, which are considered as very valuahle, and as presenting the most flattering prospects. The company have a good investment in their tunnel in the royalty upon ores, that they will undouhtedly he offered hy the owners of the ahove mines, and a number of others, for extraction as a mutual henefit. Ae a means of prospecting the mountain, the value of the tnnnel to the entire camp can hardly be overestimated. Beginning explorations at a greater depth than has yet heen attained in mining in this district, the tnnnel will he the means of solving the problem whether the mines on Prosnect mountain go down and are permanent. Almost everyhody helieves that the whole mountain, to an indefinite depth, is in ore, hut developments through the tunnel, which will practically solve the problem, will be awaited with interest and not without anxiety. There is a general confidence expressed in the result. It is altogether an econmically conducted husiness-like enterprise, carried on wholly among our own people, and it ought to turn ont well for the sake of legitimate mining enterprise, if for no other reason. It has heen of no expense to the stockholders, hut for actual working capital, some $30,000, and what is made out of the venture will he theirs directly without any 'etock hoard or other manipulations.—*Eureka Sentinel.*

Sawtooth, Idaho.

The development of our great mining field, and the evident success that will nltimately crown the efiorts of energy, is constantly giving hirth to new and heneficial enterprises. We have struggled with a sea of contingencies, have lahored with a creditahle persistence in the face of all the douhts and difficulties that are the invariahle accompaniments of mining, hut to-day we can plainly discern the cloud of douht drifting away, hringing to view the hright hlue sky of a propitious futnre. The development of our district has heen slow and tedious, hnt this has heen an advantage rather than otherwise. If failnres have heen chronicled in the history of our camp, the fact of having judicious, economical management has rendered such failure comparatively nothing in a pecuniary point of view, and consequently have not worked detrimental to the interest of the district. Immediately upon the opening of a new mining field, a cry is raised for machinery, and generally hy those who never realize the importance of finding a mine hefore making expenditures in this direction. Though we can hoast of no reducing works as yet, enterprise is stamped everywhere, and improvement constantly going on. For nearly three years the hammer and drill have heen husy; and though continually unlocking the hidden, rock-hound treasnres of this great granite range, we cannot safely say that we are yet ready for the much-coveted reducing works. Our little towns are rapidly improving; capitalists are gradually identifying themselves with our district—a certain indication of confidence and admitted permanency. Two years ago, the place from which I write could hoast of nnly two log houses, that seemed lost in the wilderness of mountains that snrronnds the town site nf Sawtooth. Time has worked a magical change, and to-day Sawtooth is a lively prosperons place, and rapidly assnming proportions. Buildings are going up everywhere, and another enterprising town stands a monument to mining industry in the great West.

We do not desire to eulogize or touch the vanity that sleeps deep in every human hreast, hut must say, with all due deference to the contrary, that the huilding of this place and the enterprise that has followed the "striking" of our mines is due mainly to the energy and determined perseverance of Col. Broadhead. This gentleman has been identified with this camp since the discovery of quartz; has ever displayed a deep, sincere interest in everything pertaining to our welfare as a mining community, and to his energy we owe the organization of those companies whose prompt action has given us the prestige we certainly enjoy. With the exception of the Pilgrim, Col. Broadhead has organized every company working in the Sawtooth district, and also the Nellie company, in Vienna district. This gentleman's lshors have not yet ended, and we are happy to meet the "old man" again in his usual haunts, persuing the same work that met with such success in the pnst.

We now have a fine highway connecting us with the lower country—a daily stage line—and, heing at the end of what might be termed stage navigation, snrrounded hy prospects of the finest order, we can certainly look forward with pride to a hright and prosperous future.

A 10-stamp mill, complete in every particular, was erected last season in the interest of the C. & B. Co. The mill is heing completed at this time, and, though not cognizant of the intentions of said company, snmise that a run will he made, and prohably the mill will be rnn at intervals on custom rock. If this latter hypothesis be correct, it will add a new impetus to prospecting, and will give the mineral helt an advertisement such as pen and paper could never give.

Though much has already heen accomplished, snfficient, we might add, to fully establish unquestionable permanency, development is still in its infancy, and we must look forward to another season for the hnilding of long-looked-for requisite machinery. There will be greater activity here this season than any previons one, and an exciting fall will open a still more active spring. So far as we can reliably ascertain, companies operating here are well satisfied with the result of this winter's works, and will crowd their mines to the fullest extent and do all in their power to have their properties in good ehape hy the close of the season.—*Cor. Vienna Reporter.*

No Point.—The Marysville *Appeal* tries to make a point against dehrie dame hy pointing to the recent giving way of the dam at Sardine lake. There ie no parallel hetween the two cases. At Sardine lake the dam held hack a large hody of clear water, and the pressure on the etructure was enormous. The debris dams are not expected to hold water, hut sand and rocks. There are to-day debris dams on a small scale in the North Ynha that have stood the freshets of 20 years, and are apparently good for all time. As soon as a dam fille with detrints there is really no pressure upon the strnctnre, hecause it holde very little water, and were it even to hreak there would he no damage done helow. In mining the river old cribe put in in 1852-'53 are encountered, as eolid ae the eternal hils.—*Downieville Messenger.*

Panamint.—Messrs. Pinney & Phehy, of the Inyo Con. company, have ehipped from San Francisco an extensive lot of material and machinery for a complete overhauling and repaire to the hig mil!—the hatteries, pans and engine coming in for a good share of attention.

Calico District.

The New Mining Camp of San Bernardino County.

The Calico *Print*, published in the new town of Calico, San Bernardino county, contains the following information ahout that camp, as to which the puhlic have had little information: "The first discovery of mineral made in this fahulously rich mining region was made some seven or eight years ago, ahont three miles northerly from Grape Vine station and Waterman & Porter's mill, and ahout eight miles distant from the rich and extensive mineral helt which surrounds for miles in every direction the promising town of Calico, and were made hy an eccentric old man hy the name of Lee, who was, it is supposed, killed hy Indians whilst on one of his solitary prospecting expeditions, some three years ago, in the vicinity of Old Woman springs. Lee first located on the property now owned hy Waterman & Porter and upon which they kept a fine 10-stamp mill and a large force of men in constant operation, the mill each day adding to the country's wealth. This ledge was worked hy Lee for a quicksilver mine, and the rich horn silver for which it is so famous was called hy him 'pencil lead,' he taking the native silver for particles of quicksilver. The work having heen ahandoned for some two or three years consequent upon the death of Lee, Waterman and Porter, heing out in quest of mining prospects, were shown this property hy Mr. E. J. Miller, Recorder of Grape Vine district. Porter, heing a practical miner, on his first visit recognized the immense value of the property and commenced making locations. This was in the fall of 1880. During that winter and in the spring of 1881, some hnndreds of locations were made in the immediate vicinity until not a red rock remained hut what is well monumented. Not until the spring of 1881 were there any discoveries made on Calico mountain. The first was made hy Lowery Silver, who is still a resident miner of the district, and was made a short distance north of where the town of Calico is now situated. The first work of any note that was done in what is now Calico district, hut then Grape Vine district (Calico having lately segregated), was some four miles northwesterly from the town, on the Consolidated and Pico olaims.

"In March or April last our worthy under-Sheriff, Tom Warden, together with Hues Thomas and others, discovered the wonder of the age, the great King mine, which is the richest and higgest mine in the State of California. After these discoveries, many others were made and located, among which were the Oriental series hy Messrs. Allison, Waldrip, Day and others, and subsequently sold to Messrs. Earl & Garnett, of San Francisco. This splendid property, upon which a tramway and mill are soon to he hnilt, is heing rapidly developed under the superintendency of Judge James Walsh, while Sam James keeps his weather eye open upon the doings around the famous King mine. During the fore part of July last, the rich deposits on the Burning Moscow were located hy J. B. Whitfield, John Peterson and Hieronymus Hartman. This mine is still in active operation, having produced some of the richest horn-silver ore ever found in the camp. Rich locations are still heing made, each day adding to the number, and the rich finds lately made in the eastern portion of the district have given an impetus to prospecting. In another article we will give a more extended notice of this portion of the district, which, until within the past few weeks, was oonsidered worthless, hut which is now proving to he one of the most valuahle. One year ago where Calico now stands there was not a single house, and on Wall street hnt one cahin (Allison's), and James Parker and Edward Miller were the sole inhahitants on the 4th day of July last, and not until Sam James and his party arrived a few days afterwards to commence operations upon the King mine, was there any show of activity. If one year has made so decided a change, what may we not expect during the next 12 months? From present appearances we hazard the opinion that ere another year shall have rolled aronnd our little wooden village will have given place to an active, hut hnstling mining town, second to none in this or any other State or Territory. Surely the richness and number of mines demand it."

Mining Industries.

The nnmber of people and the amount of capital in the mining industries of the Pacific coast have never heen as large ae at the present time. What population Nevada has, came from California; New Mexico, Arizona and Colorado have heen populated mainly from our State. San Francisco outranks every other city in the world in the manufacture of mining machinery. The etock hoarde are languishing; all of the wealth of the minee of later discovery will not he concentrated in a few individuals, as in the case of the Comstock mines. The men who have diecovered, or who have hought this property, are retaining the profits. Instead of a small annual crop of millionaires, there is a large crop of people who have passed into a condition of financial independence. The hydraulic mines, which are the canse of so much commotion, produce but a comparatively small proportion of the precions metals. As so much of this business is carried on heyond nor geographical horders, though hy men who recognize California as their permanent home, the full extent and importance of the indnstry here is not ae evident as it otherwise would he. We hoast much about the great agricultural wealth of the State, and with good reason, yet no less wealth is derived from the work of the smaller number of persons who. are delving in the mines. The spirit of adventure which still survives, is of inestimable value, and imparts to the general population some of its most admirable characteristics.—*Oakland Times.*

Mineral Veins in Mexico.

George Wilson, a mining engineer of Parral, Chihuahua, Mexico, writes to the London *Mining Journal* on the subject of "Sex, or Productiveness of Veins," says:

Sir:—Referring to the articles which have recently appeared in the *Journal* on this point, the following facts may be of interest, being the results of personal observation in Mexico. In the Parral mining district, Chihuahua, every vein which is productive in depth, has a nearly north and south course, while the few esst and west veins, though frequently affording a little rich ore near the surface, invariahly either give ont entirely or hecome harren within the first 50 ft. In the neighhoring State of Durango the same remarks hold good, one mining district illustrating it in a very marked manner—ths Guanacevi district, which is situated ahont 120 miles south of here, among the first eastern foothills of the Sierra Madre or main ridge of mountains. Mining as an industry has heen followed here for over 100 years hy the Mexicans, who have in many shafts reached a depth of over 300 ft. The system of veins here consists of five parallel north and south veins, which are distinctly traceahle, and are worked on for a distance of over 12 miles north and south. These are intersected in many places hy east and west veins, none of which run for any great distance, and in none of which has pay ore heen found helow 40 or 50 ft. deep. Recently an east and west vein was opened on, which at the surface was over 10 ft. wide, and yielded rich ore, containing much native silver, a thoroughly "specimen" mine.

A Mexican speculator, disregarding the experience of others, and carried away hy the rich surface ore, bought the claim and commenced to sink on the vein, with the result that the pay ore gave out within 20 ft., and the vein itself "petered out" within 60 ft. The same has invariably happened on every esst and west vein in the district, while in no case on any of the north and south veins has either the pay ore or the vein given out in depth; on the contrary, the ore has invariably increased, hoth in width and richness, with depth. As stated, the deepest shafts are somewhat over 300 ft., hut in several parts of the course of certain of the north and south veins they are cut hy water courses to a depth of from 700 to 1,000 ft. One of the veins so cut has ahout 6 ft. wide of pay ore on the top of the hill, while at the level of the water course it yields a hreast of hetter ore 11 to 12 ft. wide. Another vein cut to a depth of 1,000 ft. hy a creek yields 3 ft. wide of 60 ounces silver ore ahove and a width of 6 to 7 ft. of 250 ounces silver ore per ton helow.

In the shafts snnk on the mines the same facts are observahle—on the north and south veins the ore increases in width and value with depth. The explanation seems to he that these north and south ore courses are true fissure veins formed at the time of elevation of the adjoining mountains, while the esst and west veins are produced hy more recent and more local disturhances. As it may interest some of your readers to know the progress of mining here, it may he stated that the Mexican Central railroad, now heing rapidly huilt from El Paso, Texas (where it connects with three different lines of railroad to New York, and one tn San Francisco), towards the City of Mexico, is hringing large nnmhers of prospectors and capitalists to this country, to look for mining property. In Parral there are at present four American companies at work, each owning a stamp mill, and one company is erecting smelting works to smelt 100 tons of lead ores daily. In the neighboring State of Durango, at El Oro, an American gold-washing enterprise is at work; at Indee two American companies are in course of erecting stamp mills for Carmen; another American company left here last week to commence erecting a 40-stamp mill; and for Guanacevi a Canadian company is now *en route* with a 40-stamp mill, and two American companies are negotiating for mines, so as to erect 100 stamps at once. There is, however, still plenty of good mining property to he hought at reasonahlo prices from the Mexicans, and I know no more inviting field for the investment of English capital for the reasons: 1. Proved mines can he hought here for less price than is asked for mere prospect holee in the United States. 2. The mir ing laws of Mexico are more favorahle to miners and investors than those of the United States. 3. Security and safety to person and property is infinitely greater here than in the mining districts of the United States. 4. Titles are more secure and certain here, a title lawsuit for a mine heing almost unknown, while everyone knows the endless and infinite litigation ahout titles in the United States, with its costliness and annoyances. 5. Wages and snpplies are cheaper here than in the United States, and the price ohtainahle for silver hullion at the mints here is higher than in the United States, thus favoring the miner both in cost of production and selling price of his hullion product. 6. Climate and health are hetter in Mexico than in the United States mining districts.

Mechanical Progress.

Mansgement of Saws.

Heating spoils saws. Some sawyers will run a saw until it is tremendously hot, and, to make it worse, they throw cold water on the side, thus causing sudden contraction on that part of the saw, and after a few such times, the saw has to go to the factory to be hammered and put in order, and to come back to meet the same fate as before. If the saw is round, hangs true in mandrel, is in line with the carriage, filed square at top and bottom, the backs of the teeth lower than the points, with the required amount of spread set and the teeth kept well chamfered with a gummer, so that when the saw runs, only the point will come in contact with the lumber, then a saw will run free and cool and there will be no extra strain on the plate, no heating nor danger.

The causes of hurstiag of saws, in our opinion, are: 1. Square corners at bottom of tooth. 2. Out of round, with the backs higher than the points, so that instead of cutting, they scrape the dust off with the back. 3. Undue strain put upon the saw by the plate rubbing against the log, causing it to heat, which takes the life out of a circular saw.

Where inserted teeth are used and the power is light, every other tooth may be taken out and a worn out tooth put in too protect the jaw. Mills with less than 20-horse power, if the saw is put in good order, will cut 1,000 ft. more per day with every other tooth out than with the full set. Each tooth will take out one-eight inch almost as easily as one-sixteenth; that is, a sixteenth-horse power will do with a half set nearly as much as a 20-horse power will do with a full set of teeth. I have run saws where each tooth cut a trifle over one-half inch in hemlock. Saws that lap over into the log when in line with the carriage, want more set; saws are very apt to lay to the log when the set is out, especially on heavy feed. —*Indianapolis Mechanical Journal.*

A New Material for Fruit Cans.—Leatheroid is a new article which is being made of paper. It consists of a number of thicknesses of cotton paper wound one upon another over a cylinder. The remarkable qualities of strength and adhesion it possesses are derived from a chemical bath, through which the paper is drawn on its way to the cylinder. The effect of the chemical bath on the paper is said to be wonderful. Leatheroid, for the purposes it now serves, consists of about 20 thicknesses of paper; it is shaped upon or around molds, while wet, into the form it is to represent, and will hold that form perpetually when dry. When dried, it is as difficult as rawhide to cut with a knife. A company has been formed at Kennebunk, Me., for the manufacture of this article, and will at once build a large mill there for that purpose. This company is making, for introduction into the mills, roving cans, boxes, etc., to take the place of tin cans and wooden boxes. Cans made from this material are about one-fourth the weight of tin cans of equal size; while tin cans are liable to get bent, cans made from leatheroid are entirely free from this objection. They have the elasticity of thin steel, and no amount of kicking or hauling will break them. Orders have already been received from several large mills for their roving cans and boxes, which are made seamless. This substance is also used for covering pulleys to a large extent, making one of the smoothest and most lasting coverings which can be obtained.

Breaking Iron with Dynamite.—The application of dynamite to the breaking up of masses of iron too great to be broken by other means, was successfully tried near Chicago recently. A refractory chunk, "salamander," of 20 tons weight, was placed in a pit. A hole was drilled in the iron, and a charge of dynamite was inserted. Several bars of iron, weighing tons each, were placed over the pit in order to prevent small pieces of the metal from flying heavenward. The cartridge was connected with a battery, stationed 100 ft. from the pit, and after the spectators had found secluded places, the word was given, and in an instant the 20 tons of iron that had previously stood all kinds of hammering, was reduced to fragments. The steel men were completely surprised, and admitted that a feat was performed that before was held impossible.

The increasing cost of wood for constructive purposes and for railroad ties, is one of the most serious problems which confront the managers of railroads. Processes of preservation of wood have been tried with more or less success on nearly all of our trunk lines. The latest method suggested for the preservation of bridge timber and ties, consists in subjecting the finished timber first to dry heat, and then immersing it in a hot bath composed of asphalt and carbolic acid. On cooling, the solvent of the asphalt evaporates, leaving a skin or coating of asphalt on the surface of the wood that resists water and keeps the antiseptic material locked within the pores of the wood. The exterior of the wood presents a smooth and dark surface, requiring no painting. It is understood that the process is to be used on a large scale on one of the Canadian trunk lines.

New and Cheap Method for Enameling Water Pipes.—Two inventors in Bohemia have patented a direct process for enameling cast-iron pipes, which can be applied to other hollow castings that are made with cores. It consists in simply covering the sand core with the enamel and then pouring in the iron as usual. The heat of the melted iron fuses the enamel, and it attaches itself firmly to the iron, and detaches itself so completly from the sand that the enamel is said to be all that can be desired for water pipes and other industrial purposes. In casting sinks, basins, urinals, etc., the enamel can be applied to the sand on that side of the mold which is to form the inside of the basin. The composition of the new enamel is kept a secret; but it is said to differ from the old form in the simplicity of its preparation and the extraordinary cheapness of the materials used. It is so cheap that it has found very extensive use in many branches of industry.

In color this new enamel is gray. It will be useful for gas pipes as well as water pipes, because it will make the pipes absolutely tight by this glassy lining. It will be so less useful for soil pipes, which are always liable to corrosion from the gas they contain, but for conveying acid liquors like mine water, and in chemical works, for sinks and waste pipes in chemical laboratories, it should displace lead, glass, or terra-cotta.

A Novel Steam Engine.—This important improvement in steam engines appears, even to many experienced engineers, a sort of mechanical paradox. With but one crank, with two cylinders cast in one piece, and only one valve chest, the entire engine is as simple and few in parts as the simplest of ordinary single cylinder engines. It has no dead centers, but will start forward from any possible position in which it may be placed. Further, it may be stopped, started and changed from a single to either a double or compound engine, as may be desired, by the motion of a single lever, and the change to either form may be made while it is moving at any speed, just as easily, it is asserted, as when it is still. The engineer can run it with one cylinder as a single engine, or with both cylinders, using live steam, as a double engine, or with one cylinder, using live steam, and the other running by the expansion as a compound engine, either way as economically as any engine especially built for that particular way.

Zinc in Bronze.—The Society of Architects of Berlin have been investigating the causes which make some kinds of bronze become black. The fact has been remarked that a statue in Berlin, called "Old Frederic," had become covered with a darkish layer, whilst an old cannon before the arsenal had retained its fine green color, the two having been exposed to the same atmospheric actions. Upon being analysed, the bronze of the cannon was found to consist of nine parts copper and one part tin. The bronze of the statue contains a good percentage of zinc, and to zinc the change of color is ascribed. In order to ascertain if this was really the case, several copper alloys were subjected to the action of a copper solution. The alloys of tin and copper alone, took the green color, whilst the alloys containing zinc became more or less black, according to the quantity of zinc they contained.

The Steam Engine.—Taking the best types of engines of to-day as a starting point, we must depart in the following directions: We do not particularly need to increase the efficiency of the boiler as an evaporator, but we must increase its ability to withstand pressure without increasing its cost. We must decrease the friction of the engine and of the machinery of transmission to the point where the useful work is delivered. We must produce better vacuums in the condenser, and diminish its cost. We must diminish the cost of the engine. We must diminish the cost of the attendance on engines, boilers and machinery, and of lubrication. We must increase the durability of engines, boilers and machinery. Coal is too cheap even now to admit of increased economy of it at the cost of increased outlay for plant and attendance.—*Mechanical Engineer.*

Hydraulic Riveting.—The advantages of hydraulic riveting are described as follows in the journal named below: "Under the enormous pressure of the hydraulic riveter, the iron of the rivet is crowded back over its whole length, and welds to fill the void exactly, whatever may be its shape, so as closely to unite the plates, even when they are numerous and of considerable thickness. The grip is so strong that all the seams disappear, and after the riveting is done, the plates, countersinks and rivets seem to form but a single piece. The rivets of the mounting bolts can be removed by hand." Messrs. Greig and Firth, in 1879, reported the following comparative resistances: Hand riveting, .405; steam riveting, .509; hydraulic riveting, .559. These figures are evidently in favor of the hydraulic rivetiag.—*Le Genie Civil.*

Tenoning.—The *California Architect* says that "theoretically, a single tenon is stronger than a double one, and its mortise also weakens the timber into which it is framed less than two mortises would. Practically, a double tenon would be used with a joint bolt for drawing the framing together, placed between the two tenons; or it might be advisable to use two tenons to diminish the effect of shrinkage, as for instance in a door, where a double tenon often answers better than a single one."

Scientific Progress.

Experiments with the Heliograph.—A detachment of 19 men of the Sixth Cavalry and Twelfth Infantry, near Fort Grant, Arizona, under command of First Lieut. M. P. Maas, First Infantry, has been testing the practicability of heliographic signaling since July 1st, and it is pronounced a grand success. Lieut. Maas has signaled messages from the top of Dos Cabezas mountain to Fort Grant, a distance of 40 miles, which were read at once by his party at Grant. Messages can be sent with the heliograph at the rate of from 6 to 12 words per minute, according to the ability of the operator, and it is a splendid substitute for the telegraph, should the Indians cut the lines, which they have been doing, and always can do, when on the war-path, while they cannot cut a sun flash. It is understood that heliograph lines are about to be established by Lieut. Maas, and partly under direction of Col. Bracket, commanding scouting operations connecting Bowie, Grant, Thomas, Apache, and points along the Gila river, in the vicinity of Solomonville and Clifton, cavalry troops in the field to be in constant communication with one another, without waiting for carriers or the proximity of a telegraph office. The signalmen, on account of their elevated positions, are enabled to observe, with their glasses, the movements of the hostiles, and in a few minutes to communicate it to any command in the field, each of which is always to be accompanied by one or two heliographic signalmen. The great advantages of this system of transmitting messages in a mountainous and hostile country are self-evident.—*Cor. Morning Call.*

Great Magnetic Disturbance.—Important magnetic disturbances were observed in France between the 6th and 20th of April. On several days the telegraphic lines in nearly all directions were traversed by accidental currents; at certain hours the interruption was so great that dispatches could only be [sent on closed circuits with but a single earth contact. The international lines gave the same results; it is, therefore, probable that there was a magnetic storm of great extent, of which the effects were felt in the whole northern hemisphere. Phenomena of this kind are of great importance in the study of terrestrial magnetism. Mascart has recorded the principal phases as they were observed at the College de France, and has given a description of his apparatus. The storm did not break out suddenly; it was heralded for several days by an almost constant agitation of the magnetic needle. The first great shock began at 11h. 45m. P. M. on April 16th, and affected simultaneously the three elements of declination, inclination and intensity. Another similar shock occurred on the 20th. During the whole time the register of atmospheric electricity did not show any disturbance which seemed to be connected with the magnetic phenomena.—*Comptes Rendus.*

The Fluid Density of Metals.—A paper on this subject was lately read before the London Physical Society, by Mr. T. Wrightson and Prof. W. Chandler Roberts, F. R. S. The results were obtained by the process described in a former paper to the society on the fluid density of bismuth. The mean results were: For copper, 8.217; lead, 10 37; tin, 7.025; zinc, 6.48; silver, 9.51; iron (No. 4 Foundry Cleveland), 6.88. These results are slightly less than those given by Mallet's process, but they are sufficiently close. For bismuth, the fluid density found by the authors is 10.055, which is slightly more than that given by Mallet's method (9.82). The authors consider their method satisfactory. It consists in suspending a ball of the solid metal from a spiral spring, and allowing it to dip into a crucible of the same metal in a molten state. The movements of the spring as the ball melts are recorded by a pencil on a band of traveling paper.

Vibrations Produced by Railway Trains.—Prof. H. M. Paul has communicated to the Seismological Society of Japan some interesting notes on the effect of railway trains in transmitting vibrations through the ground. A box, holding about 20 lbs. of mercury, thickened by amalgamation with tin, was placed upon a heavy plank screwed to the top of a post sunk four and one-half feet into the ground. Images reflected in the surface of the mercury were observed by a telescope, as in meridian observations. An express train, passing at a distance of one-third of a mile, set the surface of the mercury in confused vibration for two or three minutes. Other observations were made at stations at somewhat greater distances. The experimenter also found that a one-horse vehicle passing along a graveled road 400 or 500 ft. distant caused a temporary agitation of the mercury whenever the wheels struck a small stone,

Another Application of Electricity.—The call for an electrical sheep shearer, made some time since by a New Zealand gentleman, and copied into these columns, has brought forth fruit as follows: The head of the Hudson Bay Fur Co., of England, who, by the way, is a Vermonter, has announced that he has applied electricity to the trimming of seal skins. The skin is drawn over a knife-edge bar, above which is stretched a fine platinum wire, which, raised to a white heat by an electric current, meets the larger hairs which rise above the under fur, and mows them down.

Origin of Atmospheric Electricity.—Van der Mensbrugghe recalls the experiment, which was made in 1816 by Dessaignes, of plunging a rod of glass into mercury. The electricity which is shown was attributed by the experimenter to the friction of the glass against the surface of the mercury, but Spring found that if the surface of the mercury is covered with lycopodium, so as to diminish the friction, the electricity remains the same. It has, however, been found to vary with the temperature and with the degree of oxidation of the mercurial surface. Mensbrugghe demonstrated, five years ago, that every liquid mass, of which the surface is expanding or contracting, becomes the seat of a thermo electric current; if the variation of surface is produced near a bad conductor, such as glass or air, the current excites phenomena of static electricity. This hypothesis greatly facilitates the explanation of atmospheric electricity, provided that the spherules which constitute mist and clouds are constantly undergoing great variations of surface. Many of the luminous phenomena which accompany the shower of mercury, when forced through a porous cup by atmospheric pressure, or when shaken in a glass vessel in a darkened room, confirm these views, and they may be regarded as a natural introduction to the study of the development of atmospheric electricity, a question of great interest to investigators in all countries.—*Bulletin of the Belgium Acad.*

Production of Organic Compounds by Electrolysis.—The experiments of Bartoli and Papasogli have been extended to the electrolysis of a lye of soda or potash by the aid of four to six large Bunsen cells, yielding hydromellate and probably also pyromellate. Upon the positive electrode little gas is discengaged, but there is a large accumulation upon the negative. The weight of the carbon diminishes but little. In mineral acids, such as sulphuric, nitric and hydrochloric, six cells are sufficient to transform some kilograms of carbon to the positive pole. After filtration the liquid does not turn brown; the deposited carbon is a black substance with a conchoidal fracture, and presenting, upon its broken surface, a brilliant substance which is not produced in the alkaline liquids, and which, in oxygen, is converted, at the ordinary temperature, into mellitic acid and its derivatives. This substance dissolves slightly in water—better in warm water—and is precipitated by acid. And mineral salts. It is also soluble in alkalies and concentrated sulphuric acid, from which it is precipitated by water. This substance is called mellogene or mellitogene. It is also produced in the decomposition of formic, acetic and oxalic acids.—*La Lumière Electrique.*

Differences of Sea Level.—During a voyage to and from Campbell island, M. Bonquet de la Grye made a series of observations upon the saltness and density of the sea water. Many meteorologists have thought that there should be an intimate relation between the saltness of the ocean and the currents which traverse it, but processes of exact investigation have been hitherto employed only in laboratories and upon a limited number of samples. Mohr's process for the investigation of chlorides, which has been popularized by M. Roux, is not only exact, but it can be employed upon shipboard under all circumstances. It requires neither accurate weighings nor difficult precautions; the moment is marked at which a change of tint is made by the addition of bichromate of potash, and a simple reading upon a graduated tube, or counting the drops of the experimental liquid, is sufficient to give, with great accuracy, the weight of the chloride which is contained in a given quantity of water. By means of this process, De la Grye has constructed a chart of the relative levels of the Atlantic ocean between 15° and 45° north latitude.—*Ann. de Chim.*

Cannonading Alleged to be Heard 1,000 Miles.—For the first time in history the progress of a great naval engagement has been consecutively reported by telegraph. A novel member of the fleet before Alexandria was a telegraph ship, through which, by means of the Mediterranean cable line, the War Office in London and the civilized world were kept informed of the movements of the war vessels and the results of the firing. The nearest cable station from Alexandria was at Malta, distant about 1,000 miles from the scene of the battle. A press dispatch says that when a telephone was attached to the Malta end of the cable the firing of the guns at Alexandria could be distinctly heard, though no oral communication was possible over that length of cable. It is not stated whether a telephone transmitter was used at the Alexandria end, or whether the general electrical disturbance, caused by the explosion of the great guns, so affected the cable as to report the shots, through the telephone, at Malta.

Prof. Nordenskjold, during his Arctic voyage, was perplexed by the question, what becomes of the bodies of animals which die a natural death? He very seldom found such remains, and declared that on Spitzbergen it was easier to find vertebræ of monster extinct reptiles than the bones of the seal, walrus or bird of the present day. The problem is yet unsolved.

Wave lengths of the sounds emitted by a man's voice in ordinary conversation are from 8 ft. to 12 ft., and of women's 2 ft. to 4 ft. per second.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Eureka Con., July 26th, $3,957; Standard, 31st, $15,484; Northern Belle, 31st, $10,551; Christy, 31st, $6,829; Star (July), $31,713; Idaho (July), $52,000; Contention Con., Aug. 1st, $14,790; Head Center, 3rd, $11,060; Eureka Con., July 31st, $6,948; Northern Belle, Aug. 3rd, $7,017; Navajo, 6th, $13,772; Christy, 7th, $7,478; Star, 3rd, $1,201; Horn Silver, 2nd, $22,500.

THE Yreka *Journal* says that farm hands, miners and general laborers are very scarce lately in that county, owing to a large number of workers having gone north to work on the Oregon railroad. Not only are white men scarce, but it is hard to get even Chinese laborers. Of course there is great demand now, on account of the harvesting season; still there is a great scarcity of labor for ordinary demands at any time.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in Mining and Scientific Press and other S. F. Journals

ASSESSMENTS—STOCKS ON THE LISTS OF THE BOARDS.

Mining Share Market.

There is nothing of interest to note in the share market, aside from what our table of fluctuations shows. The *Enterprise* thinks that something is liable to occur at almost any time in some one of the north end mines to start things up in that direction. The continuity and long life of every streak of ore found in the north end mines is an assurance that the formation is most favorable and fertile. This is also seen in the metalliferons chsracter of the rock filling the main ore channel. It shows more or less ore in streaks and hunches wherever psnetrated, and the vein porphyry is at all points strong in iron, and has a look of life.

The ore streak in No. 1 winze below the 2700 level of the Mexican continues as strong as ever. Ahout the only change seen in it is an occasional variation in dip. At present it appears to he hearing considerahly to the east, hut in going down on it a few feet further, it may again swing back to the vertical. The deposit contains some strong seams of very rich ore, while hetween these are streaks of lower grade, but the whole constitutes a good milling proposition, as is easily ascertained at any time hy samples taken across the whole width of the body as exposed in the winze.

Active operations are also ahout heing resumed in a very interesting section of the lode on the 2500 level from the Best & Bslcher and Gonld & Curry shaft. They will now he ahle to explore that section of the vein from which they were driven out hy water at the time Oshiston was supsrintendent of the Gould & Curry.

At the middle mines there will now he a wait, as further regular operations at deptb must he made through a drift from the Combination shaft. As the vein is steadily approaching said shaft, most of the work of exploring the several middle mines must soon he done from that point. Indeed, the sbaft will itself presently cut the vein. The new pumps at the 2700 level will he ready to start next Monday, when a drift may he started at the 2680 level.

At the flooded mines no move looking to the taking out of the water has yet heen made puhlic, and most of the companies concerned are now engaged in the extraction of ore from their old upper levels.

The following mining companies had cash on hand August 1st: Argenta, $6,180.54; Bulwer Con., $41,490.07; Belding, $440.18; Belle Isle, $7,205.89; Bschtel Con., $1,561.02; Chollar, $5,873.71; Con. Virginia, $31,247.44; Crown Point, $23,130.08; Grand Prize, $1,249.97; General Jackson, $3,195.88; Gould & Curry, $19,282.62; Hale & Norcross, $9,098 55; Independence, $2 696.11; Northern Belle, $35,230-.39; North Belle Isle, $649; Oro, $1,094.02; Occidental, $7,321.77; Potosi, $23,734.20; Sierra Nevada, $30,349.12; Tioga, $255 04; Union Con., $58,000; Alpha, $9,438.32; Standard Con., $95,-531.89.

The following companies were in debt August 1st: Bsst & Belcher, $15,471.16; Day, $20,000; Bstty O'Neal, $12,143 35; Mexican, $9,018.91; Ophir, $6,447.77; Standard, $95,531.89; Savage (due on assessment, $12,596.50), $8,326.59; Star (indehtedness), $17,205.49; Star (old indehtedness), $35,565.79.

ON Saturday afternoon a fire occurred in the coal pits of the iron mine at Grass Valley, and spreading to the forest, the fire did considerahle damage, hurning some 1,500 cords of wood.

Recent Contributions to the California State Mining Bureau.

[Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

4080. Cinnabar—Obtained in refining sulphur, from Sulphur Bank, Lake county, Cal., hefore it was known to be a valuable quicksilver mine.

4081. Slag from Smelting Furnace (Probably Fayalite)—The result of an overcharge of iron flux. F. E. Monteverde.

4082. Iron Ore (Pyritic)—Laurel Hill, Mono county, Cal. James Maxwell.

4083. Iron—Reduced from ore in a common crucible; mistaken for tin.

4084. Mica—Near Ravenna, Los Angeles county, Cal. C. Sweet.

4085. Barite (Sulphate of Baryta)—Found in cleaning up at the Malakoff mine, North Bloomfield, Nevada county, Cal.

4086. Silver Ore—San Juan de Dios mine, Hermosillo district, Sonora, Mexico. Said to contain silver to the value of $900 to the ton. F. E. Monteverde.

4087. Picrolite—From the Serpentine rocks, Goleta, Santa Barbara county, Cal. J. Z. Davis.

4088. Impure Manganese Ore—Containing rhodonite, silicate of manganese and pyrolusite, binoxide of manganese. From a large deposit two miles north of Sonora, Tuolumne county, Cal., at an elevation 200 ft. above the surrounding country. Course of vein, east and west. The vein is 9 ft. wide, 10 ft. below the surface; granite on the north side, slate on the south. It can be traced for a mile. Discovered in 1857 by Henry S. Macomber, by whom the specimen is presented.

4089. Sclenite (Sulphate of Lime)—San Emidio antimony mine, Kern county, Cal. S. Boushey.

4090. Wall, or Country Rock—San Emidio antimony mine, Kern county, Cal. S. Boushey.

4091. Coal—Harwood mine Nanaimo, British Columbia, between the Wellington and Vaucouver mines. E. Franklin.

4092. Stibnite (Sulphide of antimony)—San Emidio antimony mine; township 10 north; range 21 west; San Bernardino meridian, Kern county, Cal. S. Boushey. For description see "Pacific Railroad Reports," Vol. V, folio 291.

4093. Silver Ore—Prescott district, Bloody canyon, Mono county, Cal. Said to contain silver to the value of $51.46 per ton

4094. Auriferous Pyrite—Kansas mine, Fairplay, New Mexico. F. E. Monteverde.

4095. Silver Ore—Pyramid mining company, Lordsburg, New Mexico. F. E. Monteverde.

4096. Lignite—Near Lexington, Santa Clara county. Analysis: Volatile combustible matter, 23.5; fixed carbon, 47.0; water, 16.5; ash, 7.0; total, 100.0. James G. Floyd.

4097. Silicified Wood—Near Teel's marsh, Esmeralda county, Nev.

4098. Silver Ore—Alice mine, Butte Creek, Montana.

4099. Stibnite (Sulphide of Antimony)—McLeod (?), San Benito county, Cal.

4100. Clay—Five hundred and ten feet deep, basin of Clear lake, five miles west of Soda Bay, Lake county, Cal. Charles Godwin.

4101. Clay—Five hundred and twenty-five feet deep, basin of Clear lake, five miles west of Soda Bay, Lake county, Cal. Charles Goodwin.

4102. Molybdenite (Sulphide of Molybdenum)—White mountains, Inyo county, Cal.

4103. Fine laminated Sedimentary Deposit—Tomales bay, Marin county, Cal. A. W. Daua.

4104. Silver Ore—Glacier mine, Santa Catalina, Pima county, Arizona.

4105. Fire Clay (?)—Shasta county, Cal.

4106. Blue Clay (so called)—Three hundred feet from the Dudley mine, Bodie, Mono county, Cal. Hon. Joseph Wasson.

4107. Wall Rock ("Cap Rock")—Carbon River coal mines, Washington Territory.

4108. Silver Ore—Beveridge district, Inyo county, Cal. T. McDonough.

4109. Silver Ore—May Belle mine, Bodie, Mono county, Cal.

"FROM RIVER TO SEA."—This is the title of a little work which is a tourists' and miners' guide from the Missouri river to the Pacific ocean, via Kansas, Colorado, New Mexico, Arizona and California. The work is edited by Charles S. Gleed, and published hy Rand, McNally & Co., of Chicago. The price is $1 in cloth, and 50 cents in paper. It is profusely illustrated, and describes the cities and towns, resorts, etc., in all the Territories and States named. It is a gnide hook pleasantly written; nearly every page has an engraving.

THE Secretary of the Interior has rendered a decision in the case of the Grampion Silver Mining Co. of Utah. The Secretary holds that it is not necessary that an applicant for a patent shonld make proof of the service of a notice upon the delinqnent co-owners who have not paid their share of the assessments, provided the objectors to the issnance of a patent fail to file an adverse claim under section 2325 of the revised statntes.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

THE GINOCCHIO MINE—Amador *Dispatch*, Aug. 5: This mine, which is honded to a San Francisco company, and superintended by Mr. Roberts, is heing prospected with care and vigor. The main shaft is down 150 ft and a drift has been run south about 70 ft at this point, where a fine looking ledge 6 or 7 ft wide has just opened out, with the prospect of widening as they go down. We understand that the company intend to sink another 100 ft in a short time and run drifts north and south, after which time they will determiue whether it is worth while to erect more powerful and efficient hoisting works and mill. They are now preparing large receptacles on the ground on which to dump their ore until they may make further arrangements for having it crushed. The prospects look very favorable at this time for a permanent paying mine.

CALAVERAS.

WATER.—Calaveras *Chronicle*, Aug. 5: The Mokelumne & Campo Seco Water Co. is now drawing a supply of water for its ditch from its great reservoir above Railroad flat. The company claim that it will have a sufficiency of water for the season, notwithstanding 250 inches are heing drawn from the reservoir daily.

EL DORADO.

LOW-GRADE ROCK.—Georgetown *Gazette*, Aug. 5: We are glad to see mining men of experience heginning to interest themselves in the merits of our extensive mines of low-grade rock, of which there are quite a number in this vicinity. Where now we have only four mills at work on well-defined lodes within 5 or 6 miles of town—the Aultman, Josephine, Clipper and Roscrans—not mentioning 6 or 7 others on our seam mines which are run only at intervals—we confidently expect to see at least two more mills in operation in this immediate vicinity before next summer.

CLIPPER.—Since Husom & Pounding have taken hold of the Clipper mine, some 2 months since, it has become a good paying property, the little 5-stamp mill having returned to them upwards of $1,400 from about 140 tons of rock. When they took hold of this mine it was in a bad condition, the works having laid idle for 2 years, and much dead work had to he done. They are now adding another 5-stamp battery to the mill. The ledge is 30 inches wido, and the gold rather coarso. Saturday they deposited at the office of the Calfornia W. & M. Co. 47 ozs., the result of their last clean-up.

GRAVEL.—The long tunnel which has been in course of construction for a long time, to tap the gravel channel in the Hoz's Back mine, has, Mr. Fitzgerald, Secretary of the company, informs us, reached gravel, and the prospects are now good that the sharoholders will soon he receiving dividends instead of paying assessments.

MONO.

THE GOLD BAR.—Homer *Index*, Aug. 3: Dechamheau and Redlingshafer are cutting the Gold Bar lode, and are excavating and grading for a blacksmith shop and boarding and lodging house. It is expected that hefore the end of the month a number of men will be at work and taking out ore from the Con. Gold Bars. At the North Gold Bar the lode is 8 ft in width. At the Original Gold Bar the lode is 18 ft in width, and at the South Gold Bar the lodo is from 12 to 18 ft wide. This property promises to he one of the best in the district.

THE GORILLA.—This mine is still improving, and with a few men, enough ore is heing taken out to keep the Lundy reduction works constantly running. The ore is of high grade, and when certain improvements at the mine are completed, the Gorilla will furnish enough ore for a 20-ton mill.

NEVADA.

THE WIND UP GRAVEL MINE.—Foothill *Tidings*, Aug. 5: News from the Wind-Up gravel claim, Quaker Hill, is exceedingly encouraging. The tunnel is now in 200 ft, and the bedrock is pitching more than it ever has. The gravel is looking hetter than ever hefore and is widoning out. It looks as if the Wind-Up company were very close to the channel, if not on the edge of it already. Mr. Downer, who has heen driving the tunnel, came down from Quaker Hill a few days since, and expressed himself as feeling very much encouraged at the outlook of the mine.

NEW YORK HILL MINING COMPANY.—The late meeting of the Directors of the New York Hill mining company was a very important one, and they did considerable business for the ultimate good of the stockholders of the mine. The salary of the President was done away with; also the office rent and the salaries of several other officers connected with the company were reduced. The affairs at the mine are in a flourishing condition. An effort was made at the meeting to get the business of the company transferred to Grass Valley, but the effort failed.

EXPLOSION.—*Union*, Aug. 5: A hoiler explosion occurred at the hoisting works of the Idaho mine yesterday morning, about 1 o'clock, by which one of the five boilers in use in the works, was lifted from its foundation and hurled a distance of 40 ft. In its course, it tore out the end of the building and made a large hole in the metal roof. Two of the large up-right timbers forming the framework of the building were also cut in two, making altogether the picture of a had wreck. The explosion also tore off the steam drum above the boiler, made a dent in the adjoining boiler, and broke the connection of a third boiler. This was the extent of the damage, as neither the engineer nor fireman, who were on duty, were injured, as the boiler went in an opposite direction from where they were stationed at the time, and landed outside of the building.

HARTERY MINE.—Grass Valley *Union*, Aug. 3: The new incline in the Hartery mine has opened upon a good ledge of quartz about 2 ft in width, but it is only a pillar of rock left at former working, when the shatt was sunk perpendicularly from the surface until the ledge was struck, and then the incline followed the ledge. The new incline has been started from the surface through new ground, and will strike the old incline on the pitch of the vein, and has now nearly reached the point of the old workings. When this is accomplished, the incline will be on an even grade all the way down, and the water in the bottom of the mine below the level of the drain tunnel will he pumped out, and regular operations in drifting and stoping commenced. The present outlook of the Hartery is considered favorable by Mr. Stephen Moore, who is superintending the work of re-opening the mine.

ALPHA MINE SOLD.—The Alpha mine, situated near the Idaho, was sold yesterday at sheriff sale, under foreclose of mechanics' lien. A. Burrows bid in the property for M. C. Taylor and Peter Johnston, for the sum of $2,690.75.

RICH ORE.—Some rich pieces of ore were exhibited in town yesterday from a mine near Spenceville, which is generally known by the name of the "Billy Gay claim." The ore contained gold, silver, copper and lead, and the pieces shown were nearly solid mineral. The vein from which they came is represented to be 4 ft in width, equally as rich or richer in appearance than that exhibited. The shaft on the mine is now 68 ft in depth, and the vein is well defined. The claim is on what is known as the "copper belt," that traverses the foothill country in the vicinity of Smartsville, a region that has attracted considerable attention from prospectors since the San Francisco copper mining company, located on the same range, has been so successful in its operations. The ore herein mentioned is not of a character to he worked to advantage by mill process, but it is believed can he smelted easily, and will then pay handsomely by parting it for the different metals, which can he done at some of the Eastern establishments or hy being sent to Swansea. The owners of this new find are mostly Grass Valleyans.

PLACER.

THE BELMONT MINE.—Placer *Herald*, Aug. 5: The Belmont mine, below Ophir, William Werry owner, is yielding some rich ore from the two lower levels, 175 ft deep. Little stoping is being done, except what is taken out over the drifts to make room for the stulls and timbers. The shaft and drifts are being excellently timbered, with the view of permanency. Where a mine is well opened and there is a reasonable amount of gold in the ore, it is bound to pay. Mr. Werry, confident of the paying quality of the ore, is working the Belmont on this principle. He has now on the dump about 500 tons of rock, which he estimates will yield about $20 per ton.

A RICH MINE.—The Shurtliff mine, on Dutch hill, is just now yielding some exceedingly rich ore. The tunnel from the west side of the hill on the line of the ledge, is now in 630 ft, and is still being driven ahead to the pay chute that was struck in the western shaft. At 550 ft from the mouth of the tunnel a chute of rich ore was struck, and, in raising on it, the developments became simply dazzling. In additino to some 75 tons of ore now on the dump from this chute, which is estimated to go at least $100 per ton, a great deal of specimen rock has been extracted that does one good to behold. Mr. Shurtliff had some large pieces with him in town last Thursday, which, in weight, were nearly or quite half gold. The indications, he says, are all favorable to the taking out of a bushel of money now in a short time. From one side of the full to the other, wherever Mr. Shurtliff has touched this ledge, like Aladdin's lamp, it has produced riches.

A NARROW ESCAPE.—One night last week Wm. Brady, a miner working in the shaft of the Daniel Webster claim, near Michigan Bluff, was overcome with foul air, and, by the time he could be hoisted out, was in convulsions. By prompt and proper assistance, however, he was resuscitated, and, at last accounts, had almost fully recovered.

PLUMAS.

MONITOR MINE.—Greenville *Bulletin*, Aug. 2: The Monitor mine is about 3 miles south by west from Greenville. The mill has a battery of 10 stamps, and is fitted up with all that is usually found in the best appointed mills. All the water wanted is obtained from the main tunnel of the mine, though a ditch and flume connect with the headwaters of Soda creek, from which additional water can be had when wanted. The property contains two separate ledges, one known as the Monitor, the other as the Arctic. These are about 600 ft apart, and the company's claim extends 3,000 ft in length. The failure to find a ledge in the tunnel discouraged the owners of the mine, and led to a long term of idleness. Mr. George Compton, the present superintendent and part owner of the property, always insisted that there was a large ledge near the tunnel. Last fall, he persuaded his partners to resume work, and his first step was to start an upraise on the east side of the tunnel about 500 ft from the mouth; in this upraise, at a hight of 75 ft, a ledge of ore was found that proved to be about 10 ft wide. At short distances along the remaining 400 ft similar openings were made, in all of which the same ledge was found. Mr. Compton now resumed work on the tunnel, changing its direction a little, and has pushed it 500 ft farther into the mountain, the whole length now being 1,400 ft. Of this distance, 900 ft is just under the ledge, which rises obliquely over it from rigot to left, and gives 800 ft of backs to the surface along which it has been traced by prospect holes over the 3,000 ft of ground owned by the company. On the Arctic ledge there is an opening near the point of the ridge, from which ore is now being taken. Here the vein is about 14 ft wide, and is worked like a quarry. This is not all solid ore, however, but is seamed with a bluish clay in the middle; this clay is all mixed with broken quartz. About 150 ft from this open cut a tunnel is now progressing, that has just reached the ledge at a depth of 150 ft. Four hundred ft distant from this is another tunnel, where the ledge has been cut, and from which very rich rock is now taken. This tunnel struck the ledge at a depth of 80 ft.

CHEROKEE MINE.—Owing to various delays, work was not begun on the shaft till Monday; now, however, it is being pushed along, and will be continued until the additional 50 ft of depth is gained. The parties who are working the Washoe mine, about which there is likely to be some dispute with the owners of the Southern Eureka mine, want to have a milling test of the ore, and have contracted with the superintendent of the Cherokee mine for crushing 300 tons of their rock. Yesterday teams started hauling, and to-day the mill was begun on Washoe rock; a good price will be paid for the work, and the mill will be profitably employed while engaged on it. It is the opinion of all who have examined the Washoe ore that it will pay well. The ledge is opening out well, and gives every evidence of turning out a good mine.

MOVING A MILL.—The machinery of the mill for the Robertson mine is now all on the ground, and will be put in place as quickly as possible. This mill formerly stood in a deep canyon, and the work of moving it was very difficult. After being loaded the wagons had to be hauled up the mountain side by blocks and tackling, it being impossible for horses to climb the steep ascent. The work was necessarily slow, but it was all done without any mishap, nobody was hurt, no part of the wagons or machinery was injured. The men who were moving the mill speak warmly of the valuable aid given them by Capt. Barnard and his brother.

A NEW STRIKE.—Plumas *National*, Aug. 5: Mr. John Hardgrave, of Taylorville, gave us a call on Wednesday, and left with us a few specimens from a new discovery made by Messrs. Harvey & Blough, about 10 miles northeast of that place. The rock has every appearance of being first-class, and Mr. H. tells us that the cropping is very large, the walls well defined, and the indications strong that the ledge will be a magnificent one.

NEWTOWN.—Plumas *National*, Aug. 5: A little run through the Newtown country this week shows that operations are being actively pushed, and that some good pay can be looked for. The California Prospect Co., Mr. I. E. Parsons, manager, is running a new cross drift in the Deadwood claim, from one of the tunnels run by Kellar & Co., and 2 shifts are sending it along rapidly. The drift is in bedrock, but is expected to break into gravel in a short time, and there are good reasons to think it will show some big pay. When that end of the Deadwood channel is thoroughly opened the company intend to put on machinery on the ground adjoining the Leavitt claim, and open it there, as it is known to be very rich at that point. In the old Western claims the same company has 2 shifts of men pushing the main tunnel, which is now under ground 700 or 800 ft. This tunnel has been in barren ground for some distance, but recently some good prospects have been reached, and we are of the opinion that some very rich pay will be developed in the next 2 weeks. A raise from the tunnel follows over a rim, and on the back-pitch is as fine a showing of bowlders and gravel as can be seen in that district, with a lively stream of water boiling out. The lower tunnel is being pushed ahead to bottom this deposit, and as soon as it is reached some rich pay can be expected. Brummagin & Co. are still running their tunnel on Rattlesnake ravine, but are not yet through to gravel. They must be very close to the channel, however, and likely to break through any day. Leavitt & Brown have been doing considerable prospecting in the past few weeks, and have now found exactly "how the land lays." They are running a bedrock cross-drift from the drain tunnel to the main channel, and in a week or 10 days will again be taking out the big nuggets. Work in the Bushman claim is moving along vigorously, with fair pay and big chances. Meikle Bros. are fast opening up the old Nevada claims, and are now in over 300 ft. They confidently expect to strike a big streak of pay grit as soon as they can get the claims in good shape. Newtown Flat is bound to be one of the best districts in Plumas from this time on.

TRINITY.

PAIN WELL.—Trinity *Journal*, Aug. 5: Considering the extreme shortness of the water season, the gold yield of Trinity county this year has been very good, indeed. From several mines we hear of very rich gravel being struck just about the time that water failed, and big things may be expected from several localities next season—always provided there be plenty of water.

SIERRA.

ALASKA MINE *Messenger*, Aug. 5: The Alaska quartz mine, at Pike City, F. K. Shawhau, superintendent, has had some little trouble with water during the past month, by reason of the pump out working well, but the difficulty has been overcome and work in mine and mill goes right along as usual. The mine was not filled with water as reported, only the bottom level having filled up, which was an annoyance only, and would not have occurred had the pump worked right.

RICH GRAVEL.—The old Pioneer mining claim, at Grass flat, is proving to be one of the richest in Sierra county. Many years ago a tunnel was run under the flat, and considerable prospecting done, but without finding pay. Finally the claim passed into the hands of Col. B. F. Baker and others, and a hydraulic tunnel was run in far enough to tap the shaft sunk by the original Pioneer company. For several years after, little progress towards development was made. Col. Baker has always had the most unbounded faith in the mine, and has finally proved that his faith was well founded. This season he seems to have got the mine in good working order, and has developed a channel 100 ft wide that contains the richest gravel ever discovered in this county, some of it prospecting $100 to the pan. Pieces of gravel can be picked up in almost any part of the diggings that are literally studded with gold. From appearances, so far as uncovered, the channel runs into and up the ridge between Slate and Canyon creeks.

NOTES.—The Marguerite mill started up again a few days since. It has not been run since the break of the dam and flume by the giving way of the Sardine dam. The Rainbow mine, at Chips flat, has a Halladie wire rope tramway nearly completed. The same company has a 10-stamp mill under way.

NEVADA.

WASHOE DISTRICT.

CALIFORNIA.—*Enterprise*, Aug. 6: On the 2700 level the joint Con. Virginia east drift is being retimbered and a drain is being cut out in it. Are still extracting ore from the croppings.

CON. VIRGINIA.—On the 2500 level south drift No. 2 has been advanced 22 ft. On the 2700 level the joint California east drift is being retimbered and having a drain cut in it.

OPHIR.—During the week 56 tons of ore have been extracted from the croppings.

MEXICAN.—On the 2700 level west crosscut No. 2 has been extended 21 ft. Are enlarging the joint Ophir winze to make room for fans and blowers. During the week 10 tons of ore have been extracted on the 2700 level.

UNION CON.—On the 2000 level are stoping out ore. The south-east drift has been extended 17 ft. During the week 305 tons of ore have been extracted, and 562 tons and 440 lbs. sent to the mill.

SUTRO TUNNEL.—South Latorsi, Repairs, 8800-4200—Work at this point has been continued. Since last report 12 sets and 4 posts of old timbers have been removed, and 9 sets and 3 posts of new timbers placed in position, and the ground lagged; also, some men were employed to-day making repairs in the drift between the Jacket and Overman.

YELLOW JACKET.—The work of reopening the old levels and ore stopes from the Winters' shaft progresses favorably. On the sagebrush or 1900 level we are driving the north lateral drift towards the old workings in the north part of the mine. On the 2d, 3d and 5th levels we are extracting some ore of fair grade, and gradually opening and exposing more of the same quality.

BRISTOL DISTRICT.

BRISTOL.—Pioche *Record*, July 29: The affairs of the Bristol company remain *in statu quo* since our last issue. So far, nothing has been done to settle up indebtedness of the company, which is only about $3,000, as far as known, in this vicinity. The officers of the company here have not received any answers to dispatches sent by them to the headquarters at Minneapolis. The indebtedness of the company is so small that it is thought the debt will be paid. The company has been managed, from the very first, by men who are inexperienced in mining, and, thinking they knew it all, would not listen to the advice of men who had mined for years. As usual, the whole, or most of this indebtedness, is burdened on the Pioche merchants.

BULLION DISTRICT.

THE BULLION MINE.—Lewis *Herald*, Aug. 5: Arrangements are now about being perfected for the completion and alteration of the Bullion mill, at Bullion district. We are informed that 5 additional stamps will be added to the capacity of the institution, and that other improvements and alterations incidental to such change will speedily be made. It is the intention of the owners to commence on ore from the Lady of the Lake, and then do a general custom business. Dr. L. C. Frisbie, of Vallejo, Cal., is one of the principal owners, and we understand that Mr. Lockwood will be superintendent.

COLUMBUS DISTRICT.

NORTHERN BELLE.—Candelaria *True Fissure*, Aug. 5: The main drift from the 5th level has been extended 8 ft during the week without developing any change in the character of the ground. Four ft have been added to crosscut No. 1, the face being in hard quartzite. The main drift on the 3d level has been advanced 11 ft, and preparations are being made to crosscut to the north to meet the winze being sunk from the intermediate, between the 2d and 3d levels. This winze shows about the same width and quality of ore as last week. The crosscut from the 10th level is now in a total distance of 35 ft. The bulk yield of ore is about 65 tons. The bullion shipment on August account amounted to $17,569.18 up to the 3d inst. The total output for July was $31,903.14.

MOUNT DIABLO.—The north crosscut from winze No. 1 is in 64 ft, while the one to the south is 30 ft in length, and shows extremely hard ground in the face. Winze No. 2 has reached a depth of 64 ft, and has a strong ledge of low-grade ore. Assays from small streaks in it go as high as $700 per ton. The west drift from the Callison winze, below the 1st level, shows a ledge of low-grade ore 2½ ft in width, with about 12 inches of a richer grade that assays $80 per ton.

PADDY O'NEAL.—Sinking the shaft still continues, and a depth of 47 ft has been reached. The ledge in the bottom still retains its strength and size, and the ore is high grade. In extracting this high-grade pay ore, while sinking, it is difficult to do so without deteriorating its grade by mixing it with waste and low-grade ore. Fair progress, however, is made in sinking, and 10 or 15 days more work will enable the owners to form some idea of the value of their strike.

COLUMBUS CON.—The work on the drift from shaft No. 1 is progressing well in ledge formation, which gives fair assays. The bottom of shaft No. 2 continues in ledge matter, which facilitates the work of sinking. Good assays are obtained from the samples taken from the bottom, and the outlook is promising in both the drift and shaft.

O. K.—Work is still steadily progressing on this mine and its owner, Frank P. Stewart, is taking out and sacking some very high-grade ore. The vein, west from the shaft, is growing stronger, and when properly opened will show something more than a mere pocket.

EUREKA DISTRICT.

JACKSON.—Eureka *Sentinel*, Aug. 5: The Jackson shipped 45 tons of tribute ore yesterday that will average $100 per ton; the last shipment went over $100. C. L. Broy has at present 3 teams, 24 animals, employed in hauling ores, chiefly from the Albion & Eureka tunnel. Next week he expects to put on another team of 8 horses.

EUREKA TUNNEL.—The Eureka Tunnel Co. has shipped 42 tons of ore since last Sunday, the average assay value of which is between $100 and $110. Within a week Foreman Mete says he will be able to ship 12 tons per day. It would seem that at this rate the present money pressure which troubles the company will be removed. We are informed that the ore body on the drift 100 ft below the winze—the body from which the ore is being extracted—is looking well. It has been opened out 45 ft east and west, and shows a width varying from 18 inches to 12 ft.

ALBION.—An average of 40 tons of ore has been shipped from the Albion daily for the last week. This shipment will be increased from 50 to 60 tons within the next 4 or 6 days. The bins at the mine are all full, and the quantity of ore to be shipped is merely a question of the capacity of the teams, which will be increased to meet the demand. We are reliably informed that all this ore is good and pays the Albion company a handsome profit. Judging from the present outlook in Albion, it will be able to ship enough ore to run at least one furnace at the Eureka Con. works for an indefinite period.

GARFIELD DISTRICT.

THE CAMP.—Cor. Reno *Gazette*, Aug. 3: The district is comparatively a new one, having been formed but little over a year, and consequently the mines have not been developed to any great extent. The Farrington, owned by Farrington & Moss, has thus far proved the best paying property in the district. It has produced, this spring, over $100,000, with no expense whatever, save the wages of the men who wielded the picks. The ledge in this mine improves every foot sunk. The ore mills $500 per ton, and the mine is fast enriching its owners. Next in order of value comes the Honest John, owned by Joseph McClane & Son; the Lottie, owned by Johl & McDonald, and the Delawares, Nos. 1, 2 and 3, owned by Johl & McClane. The ore in the above mines is principally silver, working from $50 to $700 per ton. The mines are worked through perpendicular shafts. The shaft in the Honest John is down 140 ft, and the ledge at that depth is from 15 to 24 inches in width of very high-grade ore. The Lottie has a large amount of fine ore on the dump. The Delawares carry about the same grade of ore as the Honest John and Lottie mines, with a carbonate ledge 36 inches in width, which assays $50 and $70 per ton. Other mines of the district that have had considerable work done on them and are looking well, are the Julia, Starr, Northern Light, Billy Farrel and Ellen. The mineral belt on which these mines are located is 5 miles long and 2 miles wide. There is an abundance of wood in the vicinity, but the water used has all to be hauled from Luning, 8 miles distant. There are about 75 miners in the district, and they are all making money. The Blue Light copper mine, in the same district, is proving a bonanza. It has the dump full and an immense body of ore in sight that works from 20 upwards. It has hoisting works up and employs 25 men. The owners have built a furnace at Soda Springs, on the Carson & Colorado railroad, 15 miles from the mine, which will soon be ready for work.

LEWIS DISTRICT.

STARTING OF THE NEW MILL.—Lewis *Herald*, Aug. 2: A force of mill men have been busy the last few days in adjusting the machinery and preparing the different departments of the Highland Chief mill ready for active business. The mill is pronounced by experts as being the best arranged and best constructed of any dry mill in the State. A contract has been made with the Betty O'Neal company for their ore, on which the mill will start. Twenty stamps only will be started at present, or only one-half the mill. We will give, in our next issue, a full description of the mill and the result of its workings. Miners and chloriders need have no further excuse for not working their mines. The mill company agree to do good work, at reasonable rates, and we hope to soon hear the full 40 stamps pounding out the precious metals with which our mountains are filled.

TEMPIUTE DISTRICT.

LOOKING UP.—Pioche *Record*, July 29: Tempiute is beginning to pick up. It now has a population of 10 men, and a post-office has been established there. Several claims are being placed in such condition that they can start in working them at short notice. The parties in the East interested there intend resuming work on some of their mines shortly.

ARIZONA.

CEDAR DISTRICT.—*Alta-Arizona*, Aug. 3: J. H. Cofer of Cedar district, came in town on Thursday, and from him we learn that he has a number of men at work on the Evangelist mine, and that the mine is looking very well, also that Mr. Clark is pushing work on the road from the Sandy to the Arnold mine. Everything is progressing in good style.

NOTES.—Prescott *Courier*, Aug. 5: George Opdyke reports progress in driving a tunnel to tap the Sumner lode, Hassayampa district. He has found the country rock very hard. We have nothing new concerning ideas of Peck owners in regard to working the famous mine, but believe it to be their intention to procure hoisting works, drive the mine, take out ore and crush it. It is a fact that the Tiger mine is almost free of water. Mr. Riggs thinks he will soon be able to send up ore. We yesterday looked at specimens of ore from an 18-inch vein in the Dosoris mine, Hassayampa district. Its wealth consists of free and brittle silver, both plainly visible. We were informed that such ore as we saw will assay $15,000 to the ton. Mr. Spear, just from the Copper Mountain mine, Lower Agua Fria district, informs us that there are about 500 tons of excellent ore on the dumps. Mr. Taft has charge of the mine. Spear believes it to be the richest copper mine as yet opened in the Territory.

WALKER MINING DISTRICT.—Prescott *Courier*, Aug 4: Louis Beck and Mr. Spears are down from this high-range mining district. Mr. Beck informs us that miners of every class keep digging away, some in quartz, others in gravel. The gravel men are praying for a flow of water, so that they will be able to take out gold. Ex-United States Marshal Dake is working with a will at the smelter, which, it is expected, will shortly be in full blast.

COLORADO.

FURNACE.—Georgetown *Courier*, Aug. 3: The sampling works of the Miners' Smelting Co., at this place and at Silver Plume, were closed last Friday for a period of 30 days, on account of the large accumulation of ore at their smelting works at Golden. There is now a stock worth $750,000 at the works, and, as soon as the over-supply is reduced to a reasonable amount, the sampling mills will again be started. The company is putting in a water jacket furnace at Golden for the treatment of lead ore, and, when completed, they will have a capacity of 75 tons per day.

STRIKE.—A rich strike was made last week in the Rocky Mountain tunnel, on Leavenworth mountain, in the Montezuma lode, owned by W. B. McLain, H. M. Neville, Erastus Rhodes and Walter Allison, of Iowa. At the point where the lode is intersected by the tunnel no ore was found, but, in drifting about 100 ft west, a vein of smelting ore has been struck about 12 inches thick, and carrying a large quantity of native silver and gray copper. Over 30 sacks of ore have been taken out while running the drift 4 ft, none of which has yet been milled, but a sample assay gave a return of 816 ounces of silver to the ton.

THE Florida lode, on Saxon mountain, owned by Frank Strausser and Henry C. Parker, has been producing ore that has milled from 800 to 900 ounces of silver to the ton, and now shows a vein of smelting ore in the breast of the lower adit, where drifting is going forward, from 2 to 4 inches thick. There are two adits on the lode, the lower one 80 ft long, and the other, 100 ft above, 50 ft long. The lower adit has paid for its own development, and the upper one yielded a profit while being developed, which is certainly a satisfactory record for the property.

WORK was resumed this week on the Mount Carroll lode, Daily district, owned by C. C. Churchill, C. T. Taylor, of Omaha, Wm. Shavillin and Wm. Ireland, who will drive a crosscut tunnel to the lode that will enable them to work it at a considerable depth.

THE Plebian lode, on Columbia mountain, which is worked under lease by Henry Anderson & Co., produced last month, with a force of 4 men, $1,200 net, the ore milling 450 ounces per ton dressed into one class. The lode is opened by an adit 150 ft long, from which two shafts have been sunk, respectively 50 and 60 ft deep, from the bottom of which a drift, which is now being worked, has been driven 80 ft, and shows a regular pay vein along the drift and in the breast for a distance of 50 ft.

THE Egan tunnel drift on the Vulcan lode has been driven to the line of the Vulcan shaft, a distance of 350 ft east of the tunnel; and last week a raise was commenced to connect the shaft. There is good pay in the breast of the drift and also in the raise, with prospects of better pay above.

IDAHO.

BULLION BOOMING.—*Statesman*, Aug. 3: Five claims near Bullion, constituting the Coleman group, were recently sold to Col. Wall for $15,000. It is said that the Narrow Gauges, two of the first claims located on Deer creek, have been sold for $80,000 to Mr. Farwell, of Chicago, who was one of the purchasers of the Mayflower mine, of Bullion. The Narrow Gauges are on the line of the Bullion lode, 7 miles up Deer creek. The claims were located about 2 years ago. An Ohio company has purchased the 5 Deer creek claims known as the Sullivan group, the purchase price being $27,500, which was to have been paid last Tuesday. A force of men will be immediately put to work on these claims. This group adjoins the Narrow Gauges and Bannack claims.

NEW DISCOVERIES.—Vienna *Reporter*, Aug. 5: Thomas Parkinson lately discovered a fine prospect about 2 miles from here, on Big Smoky. The ledge is 4 ft wide, with 2 ft of milling silver ore. No assay has been made, but it will probably go in the hundreds of ounces. He is at work now developing it. James White and Ben Miller have struck a good prospect 5 or 6 miles from Sawtooth, on the opposite side of the divide. We are informed that the ore assays over 300 ounces per ton, but did not learn the width of the vein. John Hepburn has discovered a ledge, which is very wide, on North Boise, the ore from which assays from 150 to 400 ounces. No other mines have been discovered lately in that vicinity, but when the prospectors get right down to their work we expect to hear of numerous finds to report and the organization of a new district. Mr. Riley and his partners are developing the ledge lately discovered by them 2 miles north of town. The quartz looks well, but no assays have yet been made.

SAWTOOTH DISTRICT.—The mines of Sawtooth district are looking better to-day than ever before. Such reports as "improving" reach us from all directions, and new discoveries are made almost daily. Last Thursday we paid a visit to the Nellie group, and, through the kindness of O. H. Giles, the superintendent, were shown through the Nellie, the principal vein. The vein in the upper tunnel, which is in 240 ft, is 4 ft between the walls, the body of black sulphurets and ruby ore, being, on an average, about 2 ft wide, which increases as the tunnel gains depth on the vein. Some extremely rich ore has been found in the lower tunnel, which is in 190 ft. This vein is small and independent of the ore chute in the upper works. The large ore house contains a considerable amount of quartz which is being assorted into 2 grades. The first will go 500 ounces per ton, and the second 200 ounces. The first-class ore is being sacked for shipment. The walls of the mine are smooth, and separated from the ore by heavy clay seams. The Solace, under the superintendency of Mr. J. S. Wallace, is doing well. About 2 weeks ago a body of ore of extraordinary high grade was struck. Since then work has been pushed on it, and it not only increases in size as it is developed, but in richness also. The ore being sacked for shipment averages 500 ounces in silver per ton, and the quantities coming out show what the mine is. The Webfoot, better known as the Mountain King, is on the left side of Smiley creek, nearly opposite the Nellie, and about one mile from town. The main tunnel is being pushed ahead on the vein, but as little ore as possible is being taken out, the work now being to put it in shape for rapid and systematic working as soon as the mill is ready to crush. A large ore house has been constructed, and the ore necessarily taken out is being assorted into first and second class. The first grade will go, on an average, 400 or 500 ounces per ton, and the second 150 to 175. The Vienna, owned by the same company, and under the superintendency of Chris. Johnston, is turning out to be one of the great bonanzas of the west. A body of ore going up in the hundreds of ounces per ton has been struck, and the vein is being followed in by a tunnel. Every day shows an increase in the size of the body and richness, and the owners are elated over it. When the mill is running the bullion that will be turned out from both this and the Webfoot will create a stir in mining circles, and give the stages plenty of work hauling it out. The Humboldt, where it was cut by the Vienna and Solace road, a few hundred yards above town, shows a good, strong vein of solid ore, which has not been assayed yet.

NEW MEXICO.

MOUNTAIN BOY.—*New Southwest*, July 29: Ten thousand dollars were offered for the Mountain Boy mine, in the Burro mountains, last week, but were not accepted. This mine has a 40-ft shaft, at the bottom of which is a vein 2½ ft wide, assaying $867 in silver. The Blue Grass mine, 1½ miles from this city, is proving a fine property. The shaft is now 62 ft in depth, and shows a vein 14 ft wide, containing blue and green carbonates and black and red oxides of copper that assay an average of 42% copper and 41 ounces in silver. Thirty wagon loads of copper were shipped from Clifton last month. The water running from the Clifton smelter is now being panned for gold. Several mines in this county are being inspected by capitalists with a view to purchasing them. Work on the mines belonging to the Indus Co., in the Virginia district, will be resumed in the fall. Two thousand ounces of silver were shipped from Bremen's mill last week. Bremen's mill is running steadily on ore from the '76" mine. A large body of rich ore, 20 ft in width, has been found in the shaft of Bremen's "76" mine. The Shakespeare smelter will buy ore from the Floridas for flux. The Vanderbilt mine, in the Florida mountains, at a depth of 10 ft, contains a vein 4 ft wide containing galena, copper pyrites and traces of gold carbonates. The winze from 100 level in the Sherman mine is down 50 ft in good vein matter, a crosscut is being run at this point to ascertain the extent of the vein. The Silver City Co.'s mill started up on Tuesday, and is running nicely, the crushing amounts to 30 tons per day. The new machinery is working very well. Mining was never more lively in the Mogollons than to-day. The Cooney mine is being rapidly developed and prepared for the machinery that has been ordered for it in the East. On the extension of the Cooney mine work will be begun in a few days.

OREGON.

COPPER.—Jacksonville *Times*, August 5: Chas. J. Howard last week surveyed the copper mines near Waldo, Josephine county. A gentleman, said to be a representative of California capitalists, is now in this section looking at our quartz ledges. Capt. Rogers & Sons have sold their mining interests on Silver creek, Josephine county, to Newton York and Jess Smith. Wimer & Simmons, of Waldo, are now engaged in cleaning up, after a favorable season. We may expect to hear of something big from this mine. Wm. Beckert was in town during the week, and reports mining as about suspended on Galt's creek. Most of the miners there have done well. Miller & Kretzer are rushing their ditch along, and it will soon be completed. This firm proposes going into mining operations quite extensively. It is reported that John Hall and others have struck a ledge of silver-bearing quartz in Slate creek precinct that is very rich. We have learned no further particulars. Bybee, Newman & Hawkett, who own some mining ground near Waldo that is unsurpassed, now have a considerable force of white men engaged in extending their ditch some distance. They will also do a large amount of fluming, but expect to have everything in readiness when water comes.

CLARKSVILLE MINES.—Baker City *Democrat*, Aug. 2: We learn that the Clark's creek mines are doing better this summer than they have for many years, although the water has not been abundant. Wm. Neighbor has made a clean-up of between $5,000 and $6,000. Dooley & Curtis will clean-up $2,000 or $3,000. John Griffin is doing well, as, in fact, are all who have devoted their time and attention to the proper management of their claims.

Marine Architecture.

The Latest Improvements in Iron Steamboat Building.

The new iron paddle-wheel steamboat *Pilgrim*, built by John Roach & Son, the largest iron steamboat in the world, is 296 ft. longer than either the *Bristol* or *Providence*, of the Old Colony Steamboat Co. (Fall River Line), which is the owner of this new and splendid specimen of naval architecture. The hull dimensions of the *Pilgrim* are as follows: Length on deck, 386 ft., on 11 ft.; load line, 373.8 ft.; beam of hull proper, 50 ft.; beam over guards, 88.6 ft.; depth of hold proper, 18.6 ft.; depth from top of dome to floor, 60 ft. She will measure about 3,500 registered tons.

The *Pilgrim's* motive power will be put in her at the Morgan Iron Works, New York city, which will consist of a beam engine with a cylinder 110 inches in diameter, 14 ft. piston stroke, working under a pressure of 50 lbs. of steam. She will have 12 steel boilers, 3 in a nest, making 4 complete structures. The shafts are 26 inches in diameter in the journals. The paddle-wheels are 41 ft. in diameter, each wheel weighing 85 tons without the shaft. The walking beam weighs 33 tons, the cylinder 60 tons, bed-plate 60 tons, and the condenser 60 tons. The strain upon the center-pin of the working beam will be 625 tons when the engine is carrying 30 lbs. of steam. The entire steam machinery, with water in the boilers, weighs 1,363 tons. The engine is nominally 6,500-horse power, but can furnish 8,000-horse power, while only about 3,500-horse power will probably be ordinarily used.

Great care and attention has been paid to the details of construction in this vessel, so that she may be strong, safe, enduring under all circumstances, and especially in the winter season, when she stands a chance to encounter ice. She is built on the longitudinal bracket system throughout, making her one of the strongest and most secure vessels afloat; in fact, she is a double vessel.

Twelve feet aft from her stem is an iron collision bulkhead, and 42 ft. aft from her stem is another similar bulkhead. Thirty feet forward from her stern is also an iron collision bulkhead. Between the extreme forward and the after collision bulkheads the hull is double, the inner shell being of the same consistency and strength with the outer. The space between the hulls is divided by six longitudinals of strongest iron plates, running forward and aft on each side of the center keelson. The depth or space between the hull is three feet at the center, diminishing to two feet. All this space is divided by water-tight floors every 20 ft. in length, and the longitudinals divide again, thus making in all 96 water-tight compartments between the hulls. This is the first double hull ever constructed for a steamer of this class. Some ironclads have had them on a small scale. Forward, the *Pilgrim* is extra strong for a winter service boat, and is intended to go through ice fields with perfect security. Her longitudinals run up to the stem, forming breast hooks; and, at the bow, the frames are only one foot apart. Elsewhere in the hull the frames are two feet apart. Any ice which this craft will ever encounter could hardly indent her outer plating. Below decks, inside and out, everything is of iron. The water-tight compartments between the hulls are entered by means of man-holes, so that ready access inside them can be obtained for painting, cleaning, etc.

The inner hull has six water-tight bulkheads, dividing it into seven complete water-tight compartments. The decks forward are of iron, including the forecastle deck; and if her "nose" should be broken completely off, no water from outside could impair her. She has water-tight iron decks fore and aft, iron-wheel batteries and wheel bulkheads, and the A frames, which support the outer ends of the main shaft, are of iron. Also the guard-log is of iron, double, five feet five.

Her engines and boiler-room are inclosed in iron up through the doms, so that in event of collision or fire the motive power of the boat would be secure and free to propel the boat to a place of safety; also the kitchen and pantry—situated as usual in such craft—are inclosed in iron walls, and have iron bulkheads all around them. The communication of fire from the kitchen to the ship is next to impossible, and insurance against conflagration in every part, as well as sinking, are marked peculiarities of this vessel. She has three iron masts, which will be at the same time ventilators, 22 inches in the partners, and running up 26 ft. above the dome. Her king posts are of iron, 22 inches at base and 17 inches at head. The spring-bearing beds for shafts are also of iron. The engine gallows frame is all of iron as are the engine keelsons. The engine keelsons extend aft to the collision bulkhead to stiffen the whole. An iron-box keelson runs under the engine forward to the collision bulkhead. She has also two bilge keelsons, each a continuation of longitudinal No. 4 on either side; and these run fore and aft beyond the boilers and abaft the engine, to stiffen those parts of the ship which sustain the greatest weights.

In the lighting, heating and ventilation of the *Pilgrim* great care has been taken to make them perfect—both gas and electricity will be used for illuminating. She will have 253 staterooms, distributed as follows: Gallery 95, main stateroom hall 116, and social hall 42, while in the lower cabins there will be over 200 berths. She will have 10 Raymond's life-boats, 6 of his rafts, a complete outfit of Kahnweiler's cork life jackets, and to handle her heavy anchors she will have a very powerful Providence steam windlass and capstan made by the American Ship Windlass Co. The joiner work will be something superb and is from the designs of that king of decorators, William Rowland, who has spent many months in perfecting what will be the greatest effort of his life, and of which we will write in due season. The upholstering will be done by the Old Colony Steamboat Co.'s own employees at their shops at Newport.

The *Pilgrim* has been built under the personal supervision of Mr. Georgs Pierce, the marine superintendent of the line, a gentleman well adapted to overlook such an important and costly vessel.

The new steamer, as she rested on the ways, presented a handsome appearance. She is lap-streaked to the water line. Below, on the lap-strake seams, the rivet heads are rounded up to obtain greater strength, but they are not at all unsightly. The sponsons are fitted with patent plugs arranged so as to let out the water automatically and to prevent any from entering.

Judging from the appearance in Mr. Roach's shipyard, the iron ship-building industry is in fine form, there being upon the stocks, and well advanced towards completion, three iron propellers for the Savannah Line of steamers. They are each 315 ft. over all, 40 ft. beam and 22 ft. depth of hold. The first one, which is to be called the *Tallahassee*, will be launched on the 18th inst. Adjoining them is a keel just laid for a boat of the Brazil line. She is 310 ft. long, and two others have just been launched for the Pacific Mail Steamship Co.

Proposed Bear River Dam.

Wednesday evening Messrs. Phil. Nicholls, John Spaulding and E. E. Uren returned from a trip down Bear river, where they had been prospecting for a site for a debris dam, to be constructed in that river. They report locating three points on the river where dams can be cheaply and durably constructed. These points are below and opposite the town of Ophir, entirely below all mining on the river, and down in the rugged hills, where only an occasional habitation is found. In that section, with few exceptions, the land belongs to the Government. It is not worth claiming for any purpose. One of the sites is the location selected by Col. Mendell, U. S. Engineer, for constructing a Government dam for the same purpose—a debris dam to protect the rivers and valley lands below. At this point the river runs through a narrow gorge in the high hills, the river bed being not over 40 ft. wide, and gradually widening out as the bank rises, to a hight of about 500 ft. above on either side of the river. The river bed is solid bedrock, and the banks are stone all the way to the top. At this point it is proposed to put in immense blasts and throw the mountain side of solid stone into the river, making a dam that will stand for ages. Col. Mendell recommends this plan of constructing a dam at this point by this means. E. C. Uren, U. S. Deputy Mineral Surveyor, took measurements at different points as they were examined. Two other points were decided upon as being well adapted for the construction of dams, but the first, it is thought, is the best of the three.

The first thing to be done will be to get possession of the river bed and adjacent lands, after which a thorough organization and construction company will be formed. It is estimated that with an outlay of $5,000, a dam 50 ft. high can be built this fall. It is proposed to build the dam by sections—50 ft. this year, 25 or 50 next, and so on as required. Should the first dam ever become near filled, another dam will be built below, and so on continuously. —*Placer Times.*

A New Mexico Bonanza.—R. H. Scott, the constructing engineer for Maltby, Lind & Co., arrived in town yesterday, after making a trip to the Steple Rock district, in Grant county, New Mexico. Malter, Lind & Co., have contracted to put up a 20-stamp mill at the Carlyle mine, which, according to Mr. Scott, who made a thorough examination of the property, is the great bonanza of the Southwest. The mine is owned by three well-known Tombstonites, Messrs. W. A. Farrish, E. B. Gage and Chas. Leach. Mr. Farrish is superintendent of the mine, and is at present on the ground. The Carlyle is a gold mine, assaying up in the thousands, and has been prospected for 350 ft. on the ledge, which has an average width of 20 ft. Four shafts have been sunk on the mine, and all are 60 ft. deep in extremely high-grade ore. The mill will be completed by the first of October. Part of the mill and all the hoisting machinery is now at Lordsburg, the nearest railroad station to the mine. The Carlyle is located 50 miles north of Lordsburg, about a mile and a half from the Arizona line, and 15 miles from the Gila river. Sixty men are now employed building eight miles of road from the mine, at the end of which distance it will tap a good and old established highway. There is plenty of water for milling purposes, and ore enough in sight to keep the 20 stamps busy for two years. Mr. Scott made several wood contracts at Lordsburg, and will depart to commence the construction of the mill at Carlyle in a few days.—*Tombstone Epitaph.*

The strike at the Cleveland rolling mills is ended, the strikers expressing a desire to return to work,

Forest Trees of California.*

California Juniper.

(*Juniperus Californica.*)

"And she cast the boy under one of the shrubs"—of juniper. —*Moses, Gen. XXI: 15.*

This species is full oft, only a large depressed shrub, or a small tree of 20 or 30 ft. high; bark of body brown and shreddy; wood, pale; outline of top, irregular; branchlets thickest of any of the savin section; tiny scale leaves usually in threes; on young shoots they are loose and awl-form, white above; in age, they become short and thick, rounded at the tips, horny eye-lashed or fringed on the margin. These last twigs present the usual appearance of finely-corded sprays, least large and largest; these last being more loose and scale-like. In the male flowers the anther scales mostly in threes, eighteen or twenty-four, rhombic, scarcely acute; scales of the females, tiny aments, usually six, and spreading; the galbuloid berry, globose or oval, five to six lines long, signs of scales tips, or mucros scarcely prominent; seeds one, or sometimes two, four to six lines long; shell very hard, thick and smooth, shining brown above, with large bilobed whitish bilum.

We are apt to confound this common coast and island species with the great far western juniper (*J. occidentalis*). However, as Dr. Englemann observes, it is readily distinguished by the fruit, this having a drier, sweetish, and not so resinous tasted berry, which is larger and reddish-blue bloomy (instead of being smaller and blueish-black, or rarely brown, as *occidentalis* is). Found in the vicinity of San Francisco, on the Oakland hills, Mount Tamalpais and Mount Diablo, all along the Coast range in general, and on the islands off the coast southward; also, said to be in the Sierras, and so on, to Utah and Arizona.

Junipers readily climb to any cliff, and thus form the most substantial, perfect and lasting screens, walls, mantels, or mats of verdure, over the most arid, sterile, sandy or rocky places, etc. Whenever planted and trained over or against objects deemed desirable to conceal, there is in this, only a furtherance of the order of nature, and because all men and things together tend toward sympathy and manifold harmony, orderly or disorderly, with their surroundings; therefore it is, when with the former, that our eye dwells with more pleasing satisfaction upon forms that do little or no violence to the order of nature. Who can fail to admire the responsible facility with which the minor species of juniper like this thicken in and apply themselves to that humble habit that, with a hint of training, they so readily take on, of shielding the rude and the rejected; laying the soft and soothing hand of natural beauty over the sharp and ragged rocks, lighting up the lonely and desolate places of the land; venerable in sacred classics for shielding the wild ass boy of the wilderness and archer of the desert; the bright leader in sciences and human rationals!

The universal use of these berries in beer and spirits is already too well known. Hitherto there has been no call, to speak of, on this coast for such superior timber; but if ever a naval demand for knees or short ship timbers should arise, no lack of resource will be likely to limit the supply.

Lawson's Fragrant Cypress.

(*Chamæcyparis Lawsoniana.*)

"In Autumn, when the sunlight crowns the cedar-covered hill,
Shadows lengthen in the valley—shadows ominous and still."

Spirited forms you stands undoubtedly the handsomest of all our cypress family, the graceful Oregon cedar—Port Orford cedar, known also as ginger pine of lumbermen—every form of it a curve or line of beauty. Behold in detail the little flat and fan-like sprays, every one of them laterally bent and gracefully curved, as the lesser waves curve on the great swell that rolls responsive over another sea of emerald; and the long leader bough that crowns the pinnacle of its glory, bending off at a right-angle as it bows to the breeze, the most graceful among the ever-graceful ostrich-like plumes, as wavelets o'er waves are piled, climbing her ever-verdant pyramid of foliage until lost in the clouds or merged far up in the blue; and, over all this, a softened sheen of almost invisible silvery glose, lovely as an infant's or maiden's skin. Indeed, there is not a masculine, scarce a mere intellectual angular feature, anywhere to be found about this charming tree. Granted space to spread freely in sunlight and air, the slender branches, although early ascending horizontal or depending with rising extremities, nevertheless the final boughs and ultimate sprays always hang down their modest heads—those below, nearly to the ground—and so maintain the ruling feminine expression at all points and at all stages of growth. Free, in the land of the free, she develops as all orderly things should, upon her own God-given type, a light, columnoid, conic-topped tree of reflecting symmetry; and no thanks to thee, oh barbarous sciscore—the abomination of all the trees. When closed in and crowded by aggressive neighbors, the body is prudish and straight to a line often 50 to 100 feet, with neither knot nor limb. In such cases trees often attain to 150 to 200 feet or more, with that elegant shaft four to eight feet in diameter. The timber is held in very high estimation for floors, blinds and doors, finishing work, and for manifold purposes where clear, free, soft and durable wood is requisite; is rich, very delicately cream-tinted, finishes uniformly smooth, like Eastern white pine; for ceilings of rooms the aroma is found to be in a high degree sanitary; it has become the principal wood used for tubs, pails, etc., and is found excellent for boats and ships, for hollow wood-ware, when bound with brazen hoops, exceedingly neat and lasting. It should be observed, however, that it is to be avoided for most cabinet work, *i. e.*, where delicate linen and the like are kept, on account of the volatile resin permeating and discoloring all such like goods, and that to such a degree as to utterly ruin them; also, smooth and hard bodies condense it rapidly, and are soon all gummed over with dewy and ever-increasing dots, or rubied or wine-colored resin, that tarnishes to an intolerable nuisance, to say the least. For shingles, this, with redwood and incense cedars and the like, this State and coast has the amplest supply, besides that vast sylvan mine of the Great Sequoias.

A tree so choice for rural adorment requires a word of caution concerning its culture. Perhaps one of the greatest and most radical faults in the propagation of these and similar trees is that of covering the seed with soil. In nature they germinate on the surface, root down, and shoot up from that point, so that the pith is never below the moistened earth-level whence they spring, therefore they never sicken, sour, and, in their agony, succor abnormally, become stinted and precocious, crippled from the cradle, but go on in the harmony and order of nature, prospering and to prosper. True, this is bidden to all but the intelligent eye until the charm of their youth is gone. A hint to the wise in passing must suffice. Having so often seen the ill effects of a contrary course, as duty demands, we enter our protest against the profanity that ignores the sacred lessons inscribed on every page of the great Book of Nature. Easy would it be to point out the rationale on physiological grounds, but this must be left to the inquiry and intuitions of those whom it may most concern. There are many other important points of interest, best known to cultivators, that require to be observed in treating trees, especially those designed for a hardy endurance of severe climate.† This beautiful winter-green conifer is found on the Coast and Sierra connecting ranges of mountains of northern California, in the Shasta and Scott mountain ranges, only a few rarely straggling along south.

* From "The Forest Trees of California," by A. Kellogg; published by the State Mining Bureau. State Printing Office, Sacramento, 1882.

† Naturally the lower limbs of trees subserve the fundamental use of accumulating base material for future prosperity and endurance, as bulbs do from former leaf-growth, storing up their early acquisitions as frugal deposits, in anticipation of final flowers and fruits of more mature age. This principle is even more manifest in Agaves and the like, which fail to thrive—never flower or fruit if deprived of their lower leaves.

A Fortunate Runaway.

A Pair of Prospectors in Luck.

Some three weeks ago, two Comstockers struck out across the Sierras on a prospecting trip. They went over into Placer county to look for pocket ledges, placer mines, or anything else in the mining line that would pay. One of the men now writes to a friend as follows: "We spent some two weeks without finding anything we cared to stay by, and finally concluded to go down to the valleys and work for wages. You must know that, for a pack animal, we have one of the meanest and most contrary Piutes ponies. He will never do what you want him to do, and runs away on the slightest provocation. Well, we were going down a steep mountain trail, toward Georgetown, the other day, when the pony stopped short, gave a snort, and broke off through the brush down the steepest place he could find. His scattered grub, picks, shovels and cooking utensils in all directions, and finally ended by standing on his head in a deep gutter at the bottom of a ravine, where we made him fast to a tree, and then rolled him over and landed him on his feet. While hunting up our traps, we found some pieces of quartz that showed gold, and in an hour or two found the vein from which it came, and a good one it is—at least for a small party. We have made our camp in the ravine, just where the pony landed, and have made more than 'miners' wages' ever since. We have a big flat stone for a mortar, mill, or whatever you may call it, and by selecting the richest of our rock, can make pay pretty fast. How long it will hold out we don't know, but we are in a bulge of the vein that is about four feet wide. We are saving up a good deal of second-class ore (it is full of free gold), and will presently make our fractious pony do duty in an arastra.

"There is a nice little stream of water in the ravine, about 50 yards below our pocket, and on the side of this we have already commenced building an arastra. We have been into town (Georgetown) once, and sold a few ounces of gold—just to see if it was good—but you can bet we said nothing about our find. We shall stay by our pocket as long as it stays by us, then look for more along the same streak of quartz, which runs from 8 to 10 inches in width in most places, and has what Senator Fair would call a 'kindly look.' We are here for all summer, sure, and perhaps for all winter, as well."

There are 121 men employed in the machine shops of the Virginia & Truckee railroad company at Carson.

The Klamath is down to about its lowest summer stage, and in a couple of weeks all the companies will be at work taking out pay gravel.

The Engineer.

True.

The worst client that an engineer can have is not the man who understands the principles of machinery, nor the man who frankly confesses that he knows nothing about machinery, but it is emphatically the man who, knowing little or nothing about machinery, assumes in his dealings with his engineer all the knowledge of an expert. It is the man who acts contrary to the engineer's professional advice on that ground that (*his*) "common sense" dictates differently; it is the same man who, when trouble then occurs, expects to hold his engineer responsible and abuse him for the damage his own obstinacy and ignorance have caused. The only way for an engineer of proper dignity to get along with a man of this caliber is not to get along with him at all. The refusal to work for a man of this type, no matter what may be the remuneration offered, is the way which experience has found to be the best for both the interests of engineer and client. A treatise could be written on this general subject by any engineer of experience, and a treatise upon the relation of engineer and client, as hints to young engineers, would, it strikes us, be an acceptable and valuable contribution to engineering literature, but the essence of it would, in our opinion, be embodied in the statement that the engineer should be accorded an authority in his department similar to that which is now generally accorded the physician in his special profession.—*American Engineer.*

SUBMARINE WORK.—Thanks to the enterprise of an English firm, the submarine diver of the future is likely to have all the advantages which Julea Verne gave to the divers in his wonderful work, "Twenty Thousand Leagues Under the Sea." Our readers will remember that there the divers are represented by the author as putting on their armor in the usual fashion, and then attaching oxygen reservoirs at the back, going into the water free and independent of air pumps and heavy-dragging air pipes. The new system calls for the manufacture of oxygen and its compression into tanks, which are strapped upon the armor. The carbonic acid of the breath is removed by means of caustic potash, and a fresh supply of oxygen takes the place of that used up by breathing. The diver is, of course, entirely independent of the surface, and can walk about as much at his ease as it is possible beneath the surface of the water, weighted by the usual amount of lead necessary to keep him submerged. The system is one of the most interesting things in its line that has been brought before the public for many years, and submarine work will be greatly benefited by it. No doubt some time will be necessary to understand practically all the details of its working, as the system is not presented as being in a sufficiently practicable state to be in every-day use away from skillful attendance.

"COAL BY WIRE."—An article is going the rounds of the press with the very taking title of "Coal by Wire." It is an outgrowth of speculation upon the possibilities of the dynamo of the future. The gist of the article is this: That, by utilizing the immense water powers of various parts of the globe in driving dynamos, the power may be sent as electricity over comparatively small copper conductors to any point where it is desired to use it. This, of course, will do away with the necessity for the transportation of coal. It would also be possible to utilize the coal at the mines in driving engines, and then transmit their power to great distances, the profit, in that case, coming from cheap coal and the saving in its transportation. The possibilities of new combinations which the dynamo presents are so great, and our knowledge of its limitations so comparatively small, that the imagination is prone to run riot. At present we must wait for improved forms of dynamos, for there is too great a percentage of loss to allow us to introduce them into any and every situation where transmission of power may be desirable.—*Iron Age.*

THE electric light appears to be making most wonderful strides in the direction of success for general illuminating purposes. It is only within two or three years that it has been turned to practical use on a large scale; but already there is said to be, in England, France and the United States, an aggregate of more than $100,000,000 of capital represented in the introduction of this light and manufacture of the machinery and apparatus required. More than half of this immense sum, real or nominal, has been invested in America, where it is stated that over 50 companies have been incorporated. The actual cost of the plant and operating expenses can only be estimated from these figures, but must reach an enormous total. This is but a single example of the manner in which fresh channels are constantly being opened for the accumulated wealth, and new employments furnished for the labor of the country. Between the wants of a civilized community in these times and its few and simple requirements a hundred years ago, there is a wonderful and instructive contrast.

ELECTRICITY has been applied to pile-driving, a water wheel furnishing the power, which is transmitted by two dynamo-electric machines with connecting wires to the pile-driver at a considerable distance away.

Useful Information.

NEW ANTISEPTIC COMPOUNDS.—The Homer (N. Y.) *Republican* says: "While on a visit to Marathon, we had occasion to visit the pharmacy of T. L. Corwin, and while there was shown a preparation which he manufactures for preserving food. Its effects are wonderful. Meat which was four weeks old was as fresh and sweet as though brought directly from the market. Milk, butter, fruit, oysters, and, in fact, everything can be kept in a good state of preservation by its use." Antimerulion is a new preparation made in Germany by Dr. Zerener, for preventing mold, mildew and dry rot. It is produced in three forms. The liquid compound, of 30° B., consists of boracic acid, common salt, and silica, and is applied by means of a brush or pencil to wood-work or masonry. In factories where moist fumes and vapors are evolved, which favor the production of mold and fungus, this acts as a protection for the building. The so-called doubly prepared antimerulion is made of infusorial silica with the addition of 30 % of boracic acid. It is to be scattered in moist or damp places. The simple antimerulion contains, besides the infusorial earth, only 8 % of boracic acid. It is less active, and is used principally for protecting moist places from mold, for insulating material, and for excluding the heat of the earth and of the air from ice cellars and ice chests. It makes a good covering for water pipes and heating appliances. In places where mold and dry rot are feared, the antimerulion is packed in.—*Oil and Drug News.*

A DANGEROUS CIGAR LIGHTER.—Street hawkers in some of the Eastern cities, have lately taken to selling a "magic cigar lighter," which is calculated to do much mischief. As every student knows, the affinity of sodium for oxygen is so great that it will take the coveted element from water with such rapidity as to cause it to burst into flame. The new lighter is a thin strip of sodium, a fragment of which when placed on the end of a cigar and touched with water, burns with great vehemence. Few of those who buy the little vials of lighters are aware what vials of wrath they may turn out to be if unskillfully handled. The burning sodium will make an ugly wound if it comes in contact with the skin, which is likely to happen from the sputtering way it has. A sweaty finger is enough to set the stuff ablaze, or a sweaty pocket, should the cork of the bottle chance to come out. As the lighters are bought chiefly by the ignorant, who are taken by the seeming miracle of producing fire by the direct action of water, it is a wonder that no serious accidents with them have been reported. The traffic is not one to be encouraged.

ALTERATION IN FLOUR THROUGH THE ACTION OF THE SUN.—It frequently happens that wheat or rye flour, in spite of the greatest care in baking, yields an inferior loaf, and the failure is commonly attributed to adulteration; but when submitted to investigation neither microscopic nor chemical tests reveal any adulteration. Such flour is returned to the miller or dealer as unfit for use. The miller says the flour was injured by the heating of the stones, and the dealer attributes the defect to the circumstance that the sun must have shone upon the sacks during transportation. It has been proved by numerous experiments that flour cannot bear the action of the sun, even when not exposed directly to its rays. When flour is exposed to the heat of the sun an alteration takes place in the gluten similar to that produced by the heating of the stones. For this reason it is advisable that the transportation of flour should take place, if possible, on cool days or by night, as well as that flour should be stored in a cool place.

TEST FOR SPERM OIL.—If kerosene oil is added to sperm oil, it will prevent the latter from gumming. Mix thoroughly 100 parts of oil with four parts of chloride of lime and 12 parts of water. Now add a small quantity of the decoction of oak bark to destroy all traces of gelatinous matter still remaining, and allow the impurities to settle. Next agitate the clear part with a little sulphuric acid, settle once more, and remove the acid by washing, and see to it that none of the acid remains. If the oil shows any signs of becoming rancid, it ought to be boiled with water and a little bicarbonate of magnesia for about 15 minutes, when it will likely lose the power to redden litmus paper.—*Mechanical World.*

NEW MEAT-PRESERVING PROCESS.—A new process for preserving meat has recently been introduced in London, by which the heart of the animal, while living, is made to pump boracic acid into the tissues. For example, a sheep is stunned by a blow, and blood being withdrawn from the left jugular vein, a strong solution of boracic acid, kept at blood heat, is injected. The heart of the still living animal quickly pumps the antiseptic fluid into all parts of the body, and the sheep is then killed by the butcher in the usual way. The cost is slight, and the meat thus treated will keep several weeks in the heat of summer. The preservative fluid is kept at blood heat by a hot-water jacket surrounding the can from which it is pumped into the vein. The entire process occupies but a moment of time, and the animal is entirely unconscious the while. At the proper time the jugular vein is opened in the usual way, and the animal dies, still unconscious of any hurt.

DESIGNS ON GLASS.—The following is an ingenious method of obtaining mirror-like designs on glass, devised by Leclerc: The glass, having been silvered by the chemical process, is coated with a thin and uniform layer of sensitive bitumen, and this is exposed under a transparency. The next step is to wash away the unaltered bitumen with oil of turpentine, so as to leave the bituminous design on the silvered glass. The application of moderately strong nitric acid removes the silver, excepting where it has been protected by the bitumen, so that the metallic design shows like a mirror from the reverse side of the glass. The plate may be backed by paint or any other suitable material.

A CHEAP PAINT.—It is said that the following recipe will give a very cheap and durable paint for barns and outbuildings, etc.: Three hundred parts washed and sifted white sand, 40 parts precipitated chalk, 50 parts of resin, and 4 parts of linseed oil are mixed and boiled in an iron kettle, and then one part of oxide of copper and one part of sulphuric acid are added. This mass is applied with an ordinary paint brush, while warm. If it is too thick, it is diluted with linseed oil. This paint dries very rapidly and gets very hard, but protects the wood excellently.

CHEAP INSULATING MATERIAL.—It is thought that the demand for a cheap insulating material has been met by a discovery of a method by which wood, sawdust, cotton waste, paper pulp and other fibrous substances can be converted into a material perfectly impervious to moisture and acids, easily molded, under pressure, into any shape, and capable of being worked or cut into any form. This material is an excellent non-conductor of electricity, and can be used for all forms of battery cells, telegraph insulators, supports for electric-light leads, and telephone work. It affords the means of securing perfect insulation at a very much less cost than ebonite or gutta percha.

A CONVENIENT CHESS BOARD.—An iron chessboard, provided with magnetic chess-men is a Berlin novelty. The small magnets concealed in the figures cause them to adhere to the iron board and retain their places in spite of considerable shocks, such, for instance, as are received on shipboard or on railway trains.

Good Health.

Skin Grafting from Rabbits.

Dr. Lamalleree, of Paris, several months ago, performed an operation of skin grafting, employing grafts obtained from two different sources, a human being and a rabbit, those from the latter evincing a superior amount of vitality. The patient, a man 37 years old, had suffered for six years from a varicose ulcer of the left thigh, which resisted every form of treatment. The ulcer was 14 centimeters long and 8 deep. At the request of the patient, Dr. Lamalleree determined upon skin grafting, for which he obtained six grafts from the abdomen of a rabbit, it having been previously shaved, and two from the fore arm of a man. These having been placed in position, a Lister dressing was applied. After the lapse of eight days this was removed, and it was found that those furnished by the rabbit had become adherent, and that new skin was forming rapidly in their immediate neighborhood. On the other hand, the two which had been taken from the man had not adhered. The dressing was continued eight days longer. When it was removed an islet of skin, 10 centimeters long and 7 wide, was seen to have established itself upon the center of the ulcer. The dressing was again reapplied, and maintained *in situ* for eight days, at the completion of which it was taken off, and it was found that the sore had completely cicatrized. Two months later the patient was again seen, the healing process was progressing favorably, and the newly-formed skin showed no trace of its origin.—*Dr. E. C. Vidal, in Monthly Review of Medicine.*

ALTHOUGH human life is no longer ruthlessly sacrificed as it was wont to be under the Cæsars and Pharaohs when they had engineering enterprises on a large scale in hand, still there is no great undertaking of the kind without its bill of mortality. In the building of the St. Gothard railway in Switzerland, 310 workmen were killed and 877 injured. In the tunnel alone, 177 were killed on the spot, and 631 injured, of whom a number afterward died. The figures sound like the report of an engagement. In addition to the melancholy reflections which they are calculated to inspire in the traveler's mind as he passes through the tunnel, he is threatened with having his own breath uncomfortably shortened, the ventilation of the tunnel, nine and one-fourth miles in length, having been found a matter of serious difficulty. Until it is improved, by some means, only four trains can pass through in each direction in 24 hours.

TREATMENT OF PNEUMONIA BY THE INHALATION OF ETHER.—Dr. Samuel W. Francis, Newport, R. I., reports the successful treatment of an acute case of pneumonia by the inhalation of sulphuric ether. He says that "if seen early during the first stage, by inhaling ether for 30 minutes, every six hours, many severe and protracted cases of sickness would be arrested." Dr. Francis recommended inhalation of sulphuric ether for bronchitis in 1868.

Researches on Lung Disease.

Fresh proof has lately been obtained by M. Giboux, of the danger in air expired by consumptives. He experimented with four young rabbits of the same litter, and born of healthy parents. Two of them were kept 105 days in a large wooden case, with side gratings, into which was introduced daily a quantity (about 20,000 cubic centimeters) of air expired by animals in a consumptive state. This operation was performed at midday and in the evening, and each time the gratings were kept closed for two hours. In another quite similar case, the two other rabbits were similarly treated, except that the impure air was made to traverse in its way to the case, some wadding impregnated with carbolic acid. The rabbits in the first case, before long, showed loss of appetite, intense thirst, listlessness, diarrhea and loss of flesh. On being killed, both were found to have tubercles in the lungs, the liver, and the kidneys, those in the lungs being the most advanced, and the upper lobes being chiefly affected. The other couple of rabbits presented nothing abnormal while alive, and no organic alteration was observed in their organs after death. They were eaten without repugnance by the author and his family. Again, observations have been recently made by M. M. Grenant, on both men and the lower animals, regarding the influence of injuries of the lungs on the exhalation of carbonic acid. They prove that the amount of this gas exhaled is less when such disorder exists, even where there is fever. Two explanations are conceivable: The pulmonary change might bar the elimination of carbonic acid, which, in that case, would accumulate in the blood, or the injury might have the effect of diminishing the production of carbonic acid, by affecting the general nutrition. Experiments favor the last hypothesis.

The Medicinal Value of Vegetables.

A celebrated cook book discusses the medicinal value of vegetables, as follows:

"Asparagus is a strong diuretic, and forms part of the cure for rheumatic patients at such health resorts as Aix-les-Bains. Sorrel is cooling, and forms the staple of that *soupe aux herbes* which a French lady will order for herself after a long and tiring journey. Carrots, as containing a quantity of sugar, are avoided by some people, while others complain of them as indigestible. With regard to the latter accusation, it may be remarked, in passing, that it is the yellow core of the carrot that is difficult of digestion—the outer, a red layer, is tender enough. In Savoy, the peasants have recourse to an infusion of carrots as a specific for jaundice.

"The large, sweet onion is very rich in those alkaline elements which counteract the poison of rheumatic gout. If slowly stewed in weak broth, and eaten with a little Nepaul pepper, it will be found to be an admirable article of diet for patients of studious and sedentary habits. The stalks of cauliflower have the same sort of value, only too often the stalk of a cauliflower is so ill-boiled and unpalatable that few persons would thank you for proposing to them to make part of their meal consist of so uninviting an article. Turnips, in the same way, are often thought to be indigestible, and better suited for cows and sheep than for delicate people; but here the fault lies with the cook quite as much as with the root. The cook boils the turnip badly, and then pours some butter over it, and the eater of such a dish is sure to be the worse for it. Try a better way. What shall be said about our lettuces? The plant has a slight narcotic action, of which a French old woman, like a French doctor, well knows the value, and when properly cooked, it is really very easy of digestion."—*Medical Record.*

CARE OF THE TEETH.—The New York *Herald* correspondent with the party in search of the lost crew of the Jeannette, finds among the natives of northern Siberia the "most beautiful teeth in all the wide world." He says: "Three hundred verets from Yakutsk, I have seen old men of 60 and 70 with sets of teeth small and pearly white, and polished and healthy as those of the handsomest American girl of 16. Decay and suffering and unsightliness and loss are actually unknown. A physician of Yakutsk tells me that he believes the reason for this phenomenon is to be found in the habits and the kind of food eaten by the natives, as well as to a certain care taken by them from childhood up. In the first place, the Yakuts do not touch sugar in any form, for the simple reason that they cannot afford to purchase it. Secondly, they are in the habit of drinking daily large quantities of fermented sour milk, summer and winter, which is anticorhutic and is very beneficial in preserving the teeth. And lastly, they have the habit of chewing a preparation of the resin of the fir tree, a piece of which, tasting like tar, they masticate after every meal, in order specially to clean the teeth and gums of particles of food that may remain after meals. The gum or resin is prepared and sold by all apothecaries in Siberia, and is much used by Russian ladies. The fermented milk is said to be a not very savory drink. First the milk is cooked and then put into a large vase-shaped utensil made of frozen cow's dung, in which it is allowed to ferment until the winter, when it is broken up into blocks and preserved for use in the cellars all the year round."

SAN FRANCISCO:

Saturday Morning, August 12, 1882

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Mechanics Institute Pavilion; Chrome; Academy of Sciences, 97. Passing Events; Pyrites; Inspection of Mines; Mines and Mining in California; The Denver Exposition, 104. Passing Events; The Mechanics' Fair; The Oil Palm of Africa; Prehistoric Footprints, 105. Patents and Inventions; Notices of Recent Patents, 108.

ILLUSTRATIONS.—The New Pavilion for the Mechanics' Institute Industrial Exhibition, 97. The Oil Palm of Africa, 105.

MECHANICAL PROGRESS.—Management of Saws; A New Material for Fruit Cans; Breaking Iron with Dynamite; New and Cheap Method for Enamelling Water Pipes; A Novel Steam Engine; Zinc in Bronze; The Steam Engine; Hydraulic Riveting, 98.

SCIENTIFIC PROGRESS.—Experiments with the Heliograph; Great Magnetic Disturbance; The Fluid Density of Metals; Vibrations Produced by Railway Trains; Origin of Atmospheric Electricity; Production of Organic Compounds by Electrolysis; Differences of Sea Level; Cannonading Alleged to be Heard One Thousand Miles, 99.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends, 100.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Idaho, New Mexico and Oregon, 100-104.

MISCELLANEOUS.—Silver City; Prospect Mountain Tunnel; Sawtooth, Idaho; Calico District; Mining Industries; Mineral Veins in Mexico, 98. Marine Architecture; Proposed Bear River Dam; A New Mexico Bonanza; Forest Trees of California; A Fortunate Runaway, 102.

THE ENGINEER.—True; Submarine Work; "Coal by Wire;" The Electric Light, 103.

USEFUL INFORMATION.—New Antiseptic Compounds; A Dangerous Cigar Lighter; Alterations in Figure Through the Action of the Sun; Test for Sperm Oil; New Meat Preserving Process; Designs on Glass; A Cheap Paint; Cheap Insulating Material, 103.

GOOD HEALTH.—Skin Grafting from Rabbits; Researches on Lung Disease; The Medicinal Value of Vegetables; Care of the Teeth, 103.

Business Announcements.

California Electric Light Co., Geo. H. Roe, Secretary.

Gold Mine For Sale, G. A. Tyler, Copper City, Cal.

Passing Events.

Elsewhere we note the departure of the California Commissioner to the Denver Mining exposition, but without any collection for exhibition, owing to a failure to collect the necessary funds to make the display. This is to be regretted, as many persons expected California would make a fine display, as she could have done.

A topic of unusual interest now being discussed is the discovery of prehistoric footprints in the quarries of the Nevada State prison at Carson. The find is really a valuable one, and is a *bona fide* discovery. The photographs, drawings and diagrams exhibited at the Academy the other night showed accurately all the marks. In another column we speak of the subject more fully.

The gift of Mrs. E. B. Crocker, of Sacramento, to the California Academy of Sciences, of this city, of a fine, large collection of birds and mammals, is a very generous deed on the part of the lady. The collection is valued at $12,000. Of many of the birds they have no specimens even at the British Museum.

There is no news of note from the Comstock. No developments of moment have been made anywhere there. Up in Nevada county, in this State, some rich ore has been found of late, and by glancing over our summary of mining news on another page will be found the progress of the mines in various sections.

SOME of the richest gravel ever found in Sierra county is found in the channel of the Pioneer claim, Grass Flat. Some of it prospects $100 to the pan.

Pyrites.

The extraction of sulphur and sulphuric acid for the sulphuric acid manufacture from the minerals classed under this name is said to have been suggested only some 40 years ago. In Europe the business has assumed enormous proportions. The plan of extracting small quantities of copper from the residue after expulsion of 45% or so of sulphur contained in the mineral seems to have been first carried into operation on a large scale in Great Britain in 1867. In that year 500 tons of copper is credited to this source in the mineral statistics. The residue, after the extraction of the copper, is employed under the name of "purple ore" in iron smelting. This is a proof of the perfection of the preceding processes, for, as is well known, sulphur and copper are fatal to the value of iron ores when present in more than exceedingly minute proportions. Indeed, the process may be considered as one of the most perfect in the arts, all the essential ingredients of the mineral being profitably extracted and thoroughly separated. Prof. Thomas Thomson, of Glasgow, a famous chemist of his day, is credited by Muspratt with the initiation of the manufacture of sulphuric acid from pyrites in 1835, when the king of Sicily placed a heavy duty upon exported sulphur.

The treatment of pyrites is therefore an achievement of modern science. Both as an instance of the relations existing between science and industry and as a matter of growing commercial importance, it may be interesting to dwell for a moment on the financial results which ought to go some way toward vindicating the practical character of modern scientific teaching. The idea and the figures are Mr. Jas. D. Hague's, who reported on the mining industries at the Paris exhibition of 1878. In his observations on the industry in Great Britain he gives these figures as the result of the treatment of cupreous pyrites in 1877:

The pyrites imported were 679,312 tons, yielding 45% sulphur, or 305,690 tons, equal to sulphuric acid (with 1d. per pound, or £9⅛ per ton) 917,071 tons. This is £8 559,024.

Copper extracted, 17,000 tons, worth, at £74 12s. 6d (price of tough cake), £1,268,625.

Purple ore, smelted, 415,000 tons, containing 65% iron, or 260,750 tons pig, worth, at £2 5s 6d, £613,670.

This makes a total of £10,441,319, or, in our money, $50,144,810.

This Mr. Hague considers a minimum estimate; for a large proportion of the small percentage of silver contained in the pyrites is extracted, as well as the gold by, M. Claudet's process.

On this coast scarcely any attention has been paid to this important subject. Yet we have large quantities of auriferous pyrites where the gold would be no inconsiderable profit.

Worke were established about a year since, where, in the manufaoture of powder, acid had to be made, and the acid works were arranged so as to utilize the sulphurets. No special effort has been made, however, to collect large quantities of pyrites, though they are readily purchasable.

Some little time since inquiries were made here by English parties as to the amount of sulphurets available, with the idea of constructing acid worke for utilizing them. So far no practical steps have been taken, however. We import most of our sulphur from abroad.

Inspection of Mines.

Under the mines regulation act in Great Britain, there are government inspectors of mines whose duty it is to visit mines and take measures for the safety of workmen. They investigate workmen's complaints, look after the provisions of the act relating to the employment of young persons, attend to intimation of danger or irregularity, collect the statistics of the different districts, attend inquests, assist in prosecutions, etc.

The effect of this government inspection of collieries is good, as is proven by experience. The death rate in the first five years after the passage of the mines regulation act in 1855, was one life for every 111,523 tons of coal raised. In the five years ending December 31, 1881, there was one death to 248,859 tons of coal raised. These figures are very satisfactory, since, though all this is not due to inspection, a fair share of so satisfactory a state of things is due to this cause.

One inspector says that in his district, when he began inspecting, the quantity of coal raised was 7,300,000 tons, and the death rate one in 110,000 tons. This year the quantity of coal raised was 15,500,000 tons, more than double the quantity in 17 years, and the death rate one in 244,936 tons, or considerably less than one-half.

Another inspector says that in his district, in the year 1868, some 37,000 persons were employed in and about the mines, and the product was 9,705,000 tons, the deaths being 80, and a proportion given of one death to every 121,312 tons of coal raised, and for every 462 persons employed. In the year 1881 some 60,644 persons here employed were engaged in producing 18,793,831 tons of coal, the deaths being 75, and a proportion is shown of one death to every 250,584 tons raised and for every 808 persons employed.

These figures speak volumes, not only for the system, but for the improved discipline and care on the part of both managers and workmen.

In looking over its published reports, it is striking to note that the general rule providing for the inspection of mines by workmen is not taken advantage of. Reports by workmen are rarely made. It was thought that subjects such as the state of ventilation at the mine, state of roofs and propping, state of roads, number of officials, and other things in which the men are capable of judging, would give all parties confidence in the management, and check any relaxation of discipline among workmen or officials. But the men do not avail themselves of the power given them.

In this country government interference with details would not be looked upon with favor, and every superintendent does about as he pleases. Mining for coal and other materials is very different, however. In coal the greatest care has to be exercised to prevent accidents.

Mines and Mining in California.

[Written for the PRESS by A. B. PAUL.]

Of all the mining States or Territories, California, in point of mining wealth, comfort and advantages for economical mining, stands pre-eminent. It is the miner's paradise. Go where you will within its boundaries, you have fine facilities for reaching your mines, and your comforts are unequaled. Railroads give speedy transit in every direction. In comparison with Nevada's sagebrush, California, in her mining section, gives you a view of pleasant mountain homes, enrounded by the lofty pine or sturdy oak, to say nothing of her vineyards and orchards.

Arizona, with her heated atmosphere and arid plains, is not so desirable as California with her fields of grain and her refreshing breezes. For the almost inaccessible passes of Idaho and Montana, California gives you her well-beaten routes of road or rail. Take Colorado and all the States I have mentioned—for their universally rebellious ore California gives you in the main ore easily worked, being comparatively free.

In mining skill, mechanically or scientifically, California has no superior. No States has more varied styles or kinds of mining.

Her hydraulic and drift mines are scientific wonders. Her quartz mines have made life by emigration into every section. She has been the schoolhouse where more miners have received their practical education than all the States and Territories combined. All this is true, but in energy, enterprise and spirit, she now seems behind all the others. This may be an unwholesome truth, but I see it in my travels, I hear it in the miners' talk, and regret it as much as any.

The miner of enterprise in any locality of the State has to pull his train of ventures through. The life, will, and vigor of any community he may be in affords him no such aid as in former years.

The mining spirit of the past seems dead—virtually dead, and with it has died, too, the general vigorous business life of California.

Instead of our $20,000,000 and $22,000,000 of gold yearly, we should to-day be producing $60,000,000 per annum, and it only requires a little awakening up, a little more infusion of confidence among capitalists, and a proper distinction between legitimate mining and villainous gambling, to give a new life, new hope, and a speedy prosperity for a whole people.

On the beginning of the Washoe excitement, in one year California fell off in her metallic product $20,000,000. One year of her old vigor would add $20,000,000 more to the gold yield, and would this not give new life to business, new value to real estate? You may decry mining and seek other pursuits, but with the decline of legitimate mining is the decline of California.

With mining active, all pursuits are active. Bullion is the blood of business in this State, and there is no getting away from it. It was a gracious act for Colorado to throw open her doors for California to enter an exhibit of her golden wealth. It was generous. For California, with her golden nuggets from her drift mines, her dust from her hydraulic mines, and the dazzling, clean gold of her quartz specimens, to say nothing of the display she could have made of her other minerals, would have so dazzled the spectator as to draw capital from even Colorado herself, as well as from the East and West; but for the lack of public spirit the opportunity was allowed to pass.

Some may say, why did you (I) not take hold? I have, and gave six months of my time, and but for the good will of John W. Mackay, would have been left deep in the mud. In the Paris exposition I did enough to claim a release for the future in such matters. This generation should bring forward new blood and new vigor to build up the vast mining wealth of our State for our general prosperity. Mining enterprises must be fostered, and it behooves everyone to encourage them. Capital fortifies itself by so doing.

August, 1882.

CITIZENS of Nevada City are subscribing to the fund being raised to construct a debris dam at the narrows above Smarteville.

LIBERTY & Co. recently cleaned up in their hydraulic claim at Port Wine, and realized the snug sum of $12,000 for the season's work.

The Denver Exposition.

Card from the California Commissioner.

EDITORS PRESS:—The failure to secure a proper mineral exhibit for California at the Colorado exposition is much to be regretted, as there can be no doubt as to the benefit which would accrue to the State from such an exhibit. A brief reference to facts, especially pertinent to this occasion, will furnish the best argument.

In 1867, the then comparatively unknown and unimportant Territory of Colorado expended a liberal amount of money in collecting and sending a mineral display to the Paris exposition of that year, in charge of an able Commissioner—J. P. Whitney. California, the then acknowledged foremost mining district in the world, made no appropriation, but the Governor appointed Prof. M. P. Blake, the most able and fitting man in the State, as Commissioner. Prof. Blake, by the aid of a few friends, was enabled to make only a small exhibit, although he did all that any man could do without pecuniary aid. Colorado, however, with her resources just budding into notice, by aid of her liberal appropriation, was enabled to do her best, and really made a most magnificent display.

The result was that Colorado was awarded a gold medal, while California received a silver one. And thus, notwithstanding her well-earned prestige, California had to take a back seat. When the Colorado Commissioner returned, he was accompanied by a distinguished mining expert from the School of Mines of France, and by another equally distinguished mining engineer from Germany. Each of these gentlemen were commissioned by their respective governments to visit Colorado and make an official report of the value of that Territory as a mineral region. Those reports were highly favorable, and were published far and wide throughout France, Germany and England, and have no doubt done more to turn the flow of capital and immigration into Colorado than all that California has done in that direction as a State since the discovery of gold at Coloma.

By the report of last year's product of the precious metals, the Golden State of California has become fairly overshadowed by Colorado. The latter State, with less than half the years of California since her first settlement, and with inferior resources, owes her vantage position mainly to a liberal and judicious application of the ways and means employed in bringing to the knowledge of the world the character and value of her resources, and thereby attracting capital and enterprise within her border.

When it is remembered that, by the princely liberality of one man, Mr. Hanks was enabled to take to the last Paris exhibition a mineral show which astonished the world and benefited California to the extent of millions of dollars, it is very unfortunate that now, when a similar effort of almost equal importance can be made for one-third the cost, no man, nor any number of men, can be found to step forward to either pledge the faith of the State—a pledge which we fully believe would be duly honored—or advance the small sum of $3,500 needed to collect, forward and care for an exhibit which would enable California to assert and maintain her true position in the present contest among her sister States and Territories.

If nothing is done, the result will again be similar to that reached in Paris in 1867. From 30,000 to 60,000 Eastern and European capitalists and men of standing and influence, who will view the fine representative mineral products of a majority of the Pacific States and Territories at Denver, will naturally and inevitably infer from the conspicuous absence of California from that exhibit, that "she has thrown up the sponge," and will hereafter rest satisfied, not only as second in importance on the list of mining States, but that she accepts the still further inevitable result of entering upon a gradually descending scale to third or fourth in the near future.

As Commissioner for California, I greatly regret the necessity of going forward empty handed. I have asked only for sufficient to pay the bare expenses of collecting, forwarding and caring for the exhibit, offering to put in my own time and labor gratuitously, and pay all my personal expenses. This fact has been published in nearly every daily paper in the city, and yet, several days afterwards, my way was blocked and the enterprise discouraged by the publication, over the signature of a prominent citizen, that I have been "trying to get somebody to advance $3,500 to pay his [my] expenses to Denver and back." Now, "what the gentleman means by this paragraph I do not know, but if he is not ashamed of it, I am sorry for him."

WARREN B. EWER,
Commissioner from California.

San Francisco, August 7, 1882.

COUNTERBALANCING in the winding arrangements is utilized to great advantage at Townley, East Lancashire. That to make the load throughout a winding uniform is desirable, mining engineers agree. How to do it causes differences of opinion. Tail-ropes are correct in theory, but sometimes troublesome in practice, through insufficient pliability and tendency to form loops. At Townley the difficulty has been entirely overcome by the introduction of counterbalanced chains. These obtain give all the advantages of balance ropes, without their defects, and the credit of their introduction belongs to Mr. P. W. Pickup, who has shown his confidence in their efficacy by applying them, not only at Townley, but at his own colliery of Rishton,

The Mechanics' Fair.

The Seventeenth Industrial exhibition, under the auspices of the Mechanics' Institute, will open on Tuesday, Aug. 15th. The opening exercises will be held at 2 P. M., and the exhibition will be opened at 7 P. M. Every department of art and industry will be well represented by local and other exhibitors. A visit to the building this week showed the usual confusion incident to preparations for an industrial exhibition. The space has all been taken, and numerous exhibits are being put in place. By far the larger portion of the articles are yet to come, however. Still there is no doubt everything will be in readiness at the time announced.

In another column we give a description of the new building in which the fair will be held. The new building is somewhat smaller than the old, and has the same general arrangement. Mr. J. H. Culver is Secretary and Mr. J. H. Gilmore Superintendent of this exhibition, positions they have filled for many consecutive years. The music this year will be furnished by an orchestra under the leadership of Prof. Chas. Schultz. A daily paper devoted to the interests of the exhibition will be published in the building by Spalding & Co. During the continuance of the fair we shall describe the more prominent features as occasion offers.

The premium list of this exposition is quite varied and extended. In Division I, class 1, "Manufactured Products," under the head of "Steam Engines, Boilers and Appliances," there are 19 premiums; of these, 1 is a gold medal, 6 silver medals, 7 bronze medals and 5 diplomas. Under class 2, "Hydraulic Machinery and Steam Pumps," 13 premiums—1 gold medal, 7 silver medals, 3 bronze medals and 2 diplomas. Class 3, "Machinists' Tools and Metal-working Machinery," 21 premiums—2 silver medals, 13 bronze medals and 6 diplomas. Class 4, "Wood-working Machinery," 28 premiums—1 gold medal, 9 silver medals, 13 bronze medals and 5 diplomas. Class 5, "Printing and Miscellaneous Machinery," 17 premiums—1 gold medal, 10 silver medals, 4 bronze medals and 2 diplomas. Class 6, "Mining Machinery and Appliances," 14 premiums—1 gold medal, 10 silver medals and 3 bronze medals. Class 7, "Laundry Machinery," 7 premiums—1 silver medal, 2 bronze medals and 4 diplomas. Class 8, "Fire Apparatus and Appliances," 8 premiums—1 gold medal, 4 silver medals, 1 bronze medal and 2 diplomas. Class 9, "Marine Appliances," 12 premiums—4 silver medals, 6 bronze medals and 2 diplomas. Class 10, "Sewing, Knitting and Braiding Machines and Looms," 12 premiums—1 gold medal, 8 silver medals and 3 bronze medals. Class 11, "Agricultural Machinery," 33 premiums—1 gold medal, 10 silver medals, 8 bronze medals and 14 diplomas.

Division II. "Manufactured Products, Metals."—Class 12, "Iron, Steel and Lead," 18 premiums—3 gold medals, 9 silver medals, 3 bronze medals and 3 diplomas. Class 13, "Cooking, Heating and Ventilating," 10 premiums—1 gold medal, 3 silver medals, 3 bronze medals and 4 diplomas. Class 14, "General Hardware," 10 premiums—3 silver medals, 3 bronze medals and 4 diplomas. Class 15, "Cutlery and Edged Tools," 4 premiums—1 gold and 3 silver medals. Class 17, "Grates and Mantels," 16 premiums—1 gold, 8 silver and 4 bronze medals, and 3 diplomas. Class 18, "Brass Work, Gas and Lamp Fixtures, etc.," 14 premiums—1 gold, 8 silver and 4 bronze medals, and 1 diploma.

Division III. "Manufactured Products, Wood or Wood and Iron."—Class 19, "Carpenters', Joiners', Carvers' and Stairbuilders' Work, Ornaments, Glass Painting, etc.," 21 premiums—2 gold, 4 silver, 7 bronze medals and 8 diplomas. Class 20, "Musical Instruments," 5 premiums—1 gold, 3 silver and 1 bronze medals. Class 21, "Vehicles, Children's Carriages, Hobby Horses, etc.," 23 premiums—2 gold, 12 silver, 4 bronze medals and 5 diplomas. Class 22, "Furniture and Upholstery," 18 premiums—1 gold, 5 silver, 5 bronze medals and 7 diplomas. Class 23, "Billiard Tables," 5 premiums—1 gold, 1 silver, 2 bronze medals and one diploma. Class 24, "Wooden Ware, Brushes, Wire Goods, Willow Ware, etc.," 10 premiums—5 silver, 3 bronze medals and 2 diplomas.

Division IV. "Manufactured Products, Animal and Vegetable Fabrics."—Class 25, "Boots, Shoes and Leather and Rubber Goods," 23 premiums—3 gold, 6 silver, 8 bronze medals, 6 diplomas. Class 26, "Hemp, Cordage, Papers, Furs, Hair, etc.," 15 premiums—1 gold, 6 silver, 4 bronze medals, 4 diplomas. Class 27, "Woolens, Dress Goods, Carpets, Cotton, etc.," 13 premiums—2 gold, 9 silver and 2 bronze medals. Class 28, "Gentlemen's Furnishing Goods, etc.," 11 premiums—7 silver medals and 4 diplomas. Class 29, "Ladies' Furnishing Goods, Dresses, Cloaks, Millinery, etc.," 13 premiums—6 silver, 6 bronze medals and 1 diploma.

Division V. "Chemical and Natural Products."—Class 30, "Tobacco," 4 premiums—3 silver and 1 bronze medals. Class 31, "Chemical and Pharmaceutical Products," 27 premiums—2 gold, 14 silver, 8 bronze medals and 3 diplomas. Class 32, "Geology, Mineralogy, Zoology and Botany," 12 premiums—9 silver, 2 bronze medals and 1 diploma.

Division VI. "Food Products."—Class 33, "Groceries, Meats, Flour, etc.," 22 premiums—1 gold, 11 silver, 4 bronze medals and 6 diplomas. Class 34, "Wines and Brandies of California Production," 38 premiums—1 gold medal and 37 diplomas. Class 35, "Fermented Products," 3 premiums—3 diplomas.

Division VII. "Liberal and Decorative Arts."—Class 36, "Printing, Lithographing, etc.," 13 premiums—4 silver and 5 bronze medals and 4 diplomas. Class 37, "Gold, Silver and Plated Ware, Watches, Clocks, Jewelry, Bronzes, etc.," 12 premiums—1 gold, 3 silver, 5 bronze medals and 3 diplomas. Class 38, "Scientific Apparatus, etc.," 21 premiums—1 gold, 8 silver, 9 bronze medals and 3 diplomas. Class 39, "Surgical and Dental Instruments and Appliances," 7 premiums—2 silver and 3 bronze medals and 2 diplomas. Class 40, "Hairwork, Needlework, Embroidery, Shell-work, Patterns, etc.," 49 premiums—1 silver and 4 bronze medals and 44 diplomas.

Division VIII. "Fine Arts."—Class 41, "Paintings in Oil and Water Colors," $1,000 cash for the most meritorious exhibits of local artists. Class 42, "Ceramic Art," 13 premiums—1 silver and 12 bronze medals. Class 43, "Sculpture, Statuary and Carving," 8 premiums—2 silver and 6 bronze medals. Class 44, "Engravings, Original Drawings, Penmanship, etc.," 18 premiums—3 silver medals and 15 diplomas; also, bronze medals and diplomas for drawings exhibited by pupils of public and private schools. Class 45, "Photography," 10 premiums—1 gold, 4 silver and 5 bronze medals.

Division IX. "Horticulture."—Class 46, "Plants, Trees and Flowers," 7 premiums—3 silver medals, 3 bronze medals, 1 diploma and $255 in cash to go with medals. Class 47, "Fruit," 7 premiums—1 gold medal, 3 silver medals and 3 bronze medals, with $165 in cash.

The Oil Palm of Africa.

We give on this page a picture of a plant which is most highly esteemed by the natives of various parts of the "dark continent," as it

THE OIL PALM OF AFRICA—(Elais Guineensis).

produces much to serve their immediate needs, and also affords them a commercial article which returns them much revenue. It is the oil palm (*Elais guineensis*).

It grows best in shady places, and attains the hight of 15 to 16 ft. The fruit resembles the atone of the date. When ripe, this nut is heated by fermentation, and then coarsely pulverized in hollow cylinders, by which its oily matter is separated. It is then macerated in hot water, when the oil gradually collects on the surface, and cooling, concretes into a thick, unctuous cake, of a light lemon color, with little or no taste, but having a rich perfume. At the ordinary temperature of the air it is not a fluid oil. At 69° it begins to be slightly opaque; at 62° it is of the consistence of honey; at 45° it is proportionably thicker, but still retains a degree of softness. It is heavier than most of the other expressed oils. The quantity of oil in these nuts is very considerable, one gallon of nuts usually producing a quart of oil. This oil is used as butter by the natives of the Gold Coast, entering into all their culinary preparations; and, when eaten fresh, is a delicate and wholesome article of diet, differing as much from the palm oil imported into England as fresh butter does from that which is rancid. It is employed in this country to make a soap, which bears the name of palm soap; and also enters into the composition of other articles of perfumery.

The oil palm delights in a hot, moist climate, and would not succeed in this State, probably not even in greenhouses. The engraving represents rather a young tree. The palms of this species begin bearing when very young.

OVER 70,000 persons are said to be members of the Amalgamated Association of Iron and Steel Workers.

Prehistoric Footprints.

Discoveries in a Nevada Quarry.

As we have stated in another column of this number of the PRESS, papers were read at the last meeting of the California Academy of Sciences, giving an account of the wonderful discoveries in the quarry of the Nevada State prison, at Carson. The paper by Dr. Harkness and Mr. Gibbes is quite voluminous, and is reserved for another occasion. Mr. J. R. Scupham read a brief paper on the subject, which gives a very good idea of the details of the find:

Certain members of the Academy being informed of some remarkable impressions of footprints uncovered in the quarry of the Nevada State prison, on the 21st of July, I joined Dr. H. W. Harkness and Mr. C. D. Gibbes in an inspection of the locality. A short spur of high hills, cut off on the south by the Carson river, from the Pine Nut mountains, pierces the Carson plains like a great promontory. This spur consists principally of primitive and crystalline rocks, and is about three miles in length, with peaks rising to a hight of 900 to 1,100 feet above the plain. Extending out from the northern point of this range is a low sandstone ridge, at the northern end of which is situated the Nevada State prison. From this point we have an outlook over all of Eagle valley, in which the town of Carson is now situated.

At the time this sandstone was formed this valley contained a lake about three miles in diameter, with an island in its center and outlet to the east. A string of such lakes, including Washoe lake, filled the valleys parallel to Lake Tahoe and about 10 miles to the eastward. The prison is situated in latitude 39° 9′ north, longitude 119° 44′ 4″ west, at an altitude of 4,592 feet above the sea.

The Sandstone Spur

On which the prison is built, according to the coloring of King's maps (in the geological survey of the 40th parallel), belongs to the miocene tertiary. This classification will be confirmed or corrected by the gentlemen who have since visited the spot. The prison quarry has uncapped this spur to a depth of from 30 to 40 ft., and at that depth has exposed a horizon of arenaceous shale about three acres in extent. On this surface are the tracks or footprints we went to examine. This horizon has now a dip of about seven degrees to the north and west. The prison buildings and yards occupy about half the area exposed, so that the whole surface sufficiently uninjured to show the tracks is in all not more than one and a half acres. This surface we found

Thickly Covered with Tracks,

Both of animals and birds. The tracks in general are not very sharply defined, but are as distinct as such tracks could be after being filled by a core of sand, subjected to pressure, indurated, and this sand core again scraped out. Such is their condition at present. In general appearance they will compare with tracks in the mud of the Oakland flats after the washing of two or three tides. The first tracks to which my attention was specially called were eight great square impressions coming out with even pace from under the superincumbent rock on the eastern edge of the quarry.

These tracks are about 20x22 inches in size, and show a stride of about 4½ feet. The eight steps end in a confused, disturbed surface of the stone, in which may be traced two more tracks, not in the regular stride. If this point was then the margin of the lake, we can imagine these tracks to show the animal going in to drink, stepping about a little, and finally going out on a portion of the surface which is now broken up. These tracks must certainly have been made either by the mastodon or the mammoth. Either animal might have made such tracks, if the hind foot, in walking, should tread into the track of the fore foot. Some fragments of tusks and bones taken from the overlying sandstone appear to belong to the mammoth, and so make it probable that these are the impressions of the mammoth's foot. The tracks of a great wading bird are found intermingling with the mammoth tracks.

About 40 paces to the south, coming apparently from under the cliff, and from the same point on the shore, are tracks of still greater interest. Striding along with even pace to the northeast, are

Twelve Great Footprints,

Such as a giant man would make if shod with a thick-soled moccasin or sandal. As the tracks proceed the impressions grow deeper, as if the shore mud had been softer in that direction. Beyond the twelfth track the surface on which the impressions are found has been broken away; but a little further to the west, apparently the same tracks are seen again, retrograding as if toward the bank or shore. A little further to the south are confused tracks of a man and some large animal. Only two or three steps of the man are distinct; then the confusion that appears to mark a struggle, and then the impression where a great body had fallen. After the struggle the great crane has waded about over the spot; its tracks winding in and out, as if it had been avoiding with care the deep impressions made by the combatants, till at last, stumbling into one, it rises in startled flight. Farther to the north are

Many Human Tracks,

All telling different stories of the track-makers. Though varying slightly, all are at first sight gigantic, both in size and stride. Most have the straight-pointed toes, supposed to distinguish the white man's track of to-day. But one, at least, has the toes strongly turned out, with short steps, walking as a man would dragging behind some heavy weight. In no case is the naked foot distinctly shown in these tracks, though some of them might have been made by the naked foot. Yet it is hardly possible for one looking upon these impressions to doubt their human origin. To one who has tracked both bear and Indians on mountain and plain, there is not a moment's doubt in assigning the tracks of either to the right animal. The same experience rejects at once the saurian or bear theory in the presence of these tracks.

The exact age of the formation will probably be determined by the

Shells and Other Remains

Found in the sandstone. Whether this will place it in the miocene, and so carry our knowledge of the presence of man one step farther into the past, or only leave it in the quarternary, where the Neanderthal and Calaveras skulls have already established it, this discovery will, in any event, have a peculiar interest. The evidence of greatest antiquity for man heretofore discovered—a skull here, some pottery or ivory carving there—have all been questioned. And even when admitted are but isolated facts. The form of the skull may tell something of the nature of that particular man, but these all fail in interest before the story of actual life which is told in these footprints. The presence of the mammoth would seem to indicate a vegetation far more luxuriant than that of the present day, which could not well support with scanty sage-brush or greasewood its herbiferous bulk.

The Great Number of the Human Tracks

Also tells a story. No three acres of wild lagoon of the present day would be likely to show so many. If a village was located on the bank near by, then we might account for the number. But if a village was there, would so many wild, shy animals have visited the spot? Was this section of the earth more densely inhabited then? Or was this the temporary camp of a war party that moved away and left the spot to solitude again?

I suggest these surface thoughts, leaving the question of the exact size and weight of the homo to be determined by abler anatomists. I could see in the superincumbent sandstone periods of flood and freshet and the rarer periods of still submersion, which shows that the leaf from the past that we are examining was not the last of its period marked by the formation of the Carson valley sandstones.

THE MINING EXPOSITION.—From the card of the California Commissioner in another column it will be seen that this State sends no collection of ores to the Denver exposition. Mr. Ewer made every effort to do so, but it was impossible to accomplish the object. There were plenty of specimens, but there was no money to carry out the objects. There was no time to make a canvass for subscriptions, so the project had to be reluctantly given up. Mr. Ewer, who has gone to Colorado, will write a report on the exposition. He will furnish the PRESS with notes from there, which will be found of interest to all mining men.

SEVERAL carloads of Chinese goods, for use in Montana, have lately arrived at Corinne, from California, there to be sent by wagons to Butte and Deer Lodge, Montana. This old style of freighting goods a distance of over 400 miles seems strange in this day, alongside of a railway, with which teams must compete.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

Office, No. 230 California Street - - San Francisco, Cal.

Colorado Iron Works,

MANUFACTURERS OF

ENGINES, BOILERS, RAILWAY CAST AND WROUGHT WORK, BRIDGE WORK, BOLTS AND BOLT ENDS, BUILDING WORK, ETC.

MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupellation Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.

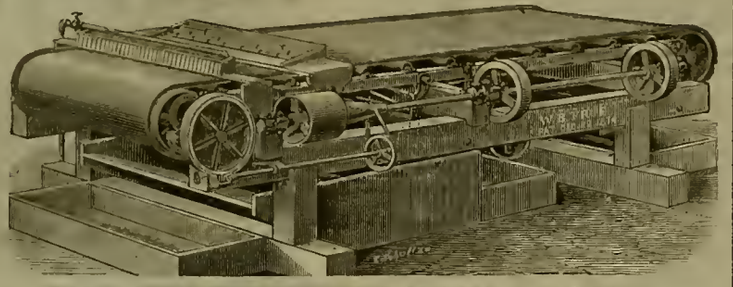
SHEET IRON PIPE.

FRANCIS SMITH & CO.,
Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand

SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.
☞ A machine with all improvements can be seen in working order and ready to make tests, at the office of Huckley, Spiers & Hayes, 220 Fremont street.
ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supplies Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞ Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR THE WEEK ENDING AUGUST 1, 1882.

261,976.—BOOK MARK AND PAPER CUTTER—Frank D. Adams, Auburn, Cal.

261,914.—BEER FAUCET—R. Eberbard, S. F.

262,134.—GRAIN SPREADER FOR THRASHING MACHINES—R. H. Johnson, Woodland, Cal.

261,857.—EGG BEATER—Geo. M. Kitterman, San Rafael, Cal.

262,129.—CONSTRUCTION OF CABLE RAILWAYS—Henry Root, S. F.

262,167.—WOOD PLANING AND SAWING MACHINE—Jos. F. Welch, Globe City, A. T.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

BLIND BRIDLE.—Joseph Cairn Simpson, S. F. Dated July 25, 1882. No. 261,773. This invention relates to an improved blind bridle, which is especially useful for race horses, and it consists of peculiarly formed blinds with supporting cheek pieces and a bridla having a head pad and various adjusting straps by which the position of tha blinds may be regulated and maintained. The invention is designed to provide a blind bridle which does not intarfere with the functions of the aye, giving plenty of vantilation without the possibility of the blind injuring that organ, whila it may, at the same time, be exactly adjusted and will keep its place without a chanca for disarrangement. It thus limits the vision to any desired point, and in this manner controls the action, and its lightness is such as to be a slight incumbrance and to prevent the heating of the head caused by the ordinary blinkers.

DIRT SCRAPER.—Jas. Porteous, Fresno City, Cal. No. 261,759. Dated July 25, 1882. This invention relates to the class of dirt scrapers, and more particularly to certain improvements in those commonly known as "buck scrapers," in which tha power of horses is applied to drag along the ground a vertical or slightly inclined board, which scrapes the dirt and carries it before it to any required place, said boards being usually provided with a tail-board, upon which the driver stands. The invention consists in the combination and arrangement of parts.

For Sale.

A twenty-stamp steam mill, complete and almost new. Also, air compressors, drills and mining machinery. Anyone having a gold or silver mine warranting the investment, may buy this material on time by making monthly or quarterly payments. Address, CHARLES E. SHERMAN, Havilah, Kern County, Cal.

Mining and Other Companies.

Pereone intereated in incorporatione will do well to recommend the publication of the official noticee of their companies in thie paper, as the cheapeet appropriate medium for advertieing.

Bullion Silver Mining Company.—Location of principal place of business, San Francisco, California; location of works, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given that, at a meeting of the Board of Directors, held on the first day of August, 1882, an assessment (No. 25) of Fifty (50c) Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 3, No. 328 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fifth day of September, 1882, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 27th day of September, 1882, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. M. BRAZELL, Sec'y.

OFFICE—Room 3, No. 328 Montgomery street, San Francisco, California.

Seaton Gold Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Drytown, Amador Co., California.

NOTICE.—There are delinquent upon the following described stock, on account of Assessment No. 1, levied June 6, 1882, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. of Certificate.	No. of Shares.	Amount
Martin, A. (Trustee)	8	5000	balance, $200.00
Martin, A, (Trustee)	9	5000	750.00
Martin, A, (Trustee)	20	500	75.00
Martin, A. (Trustee)	21	500	75.00

And in accordance with law, and an order of the Board of Directors, made on the 6th day of June, 1882, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at 528 California St., Room 6, San Francisco, Cal., on Wednesday, August 16th, 1882, at the hour of 4 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expense of sale. A. MARTIN, Sec'y.

OFFICE—Room 6, 528 California St., San Francisco, California.

DIVIDEND NOTICE.

OFFICE OF THE

Bulwer Consolidated Mining Company,

San Francisco, July 25, 1882.

At a meeting of the Board of Directors of the above-named Company, held this day, Dividend No. 9, of ten cents (10c) per share, was declared, payable on SATURDAY, AUGUST 12, 1882. Transfer books closed on Wednesday, August 2, 1882, at 3 o'clock P. M. This dividend is payable at the Farmers' Loan and Trust Company in New York on all stock issued there, and at the office in this city on all stock issued here.

WM. WILLIS, Secretary.

OFFICE—Room 20, Nevada Block, No. 309 Montgomery St., San Francisco, Cal.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS. ☞Send for Pamphlet showing methods of testing the different qualities of all Powders.

The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT, No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Dobouita." It is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

VOLUME XLV Number 8

Miners' Relief Funds.

The establishment of miners' permanent relief funds in different parts of Great Britain has done a great deal of good, placing the workmen, by means of a small weekly subscription, in a position by which they are independent of public or parochial aid when unable to follow their employment, and, in the event of their deaths, securing a provision for their families. The mine owners are also liberal contributors to these funds, in which they take a great interest, so that the combination of masters and workmen, so far, has been successful in raising funds to meet the many demands that are made upon them by the aged, the sick, injured, and the families of those who die from natural causes, or who are killed whilst following their ordinary employment—at all times a dangerous one.

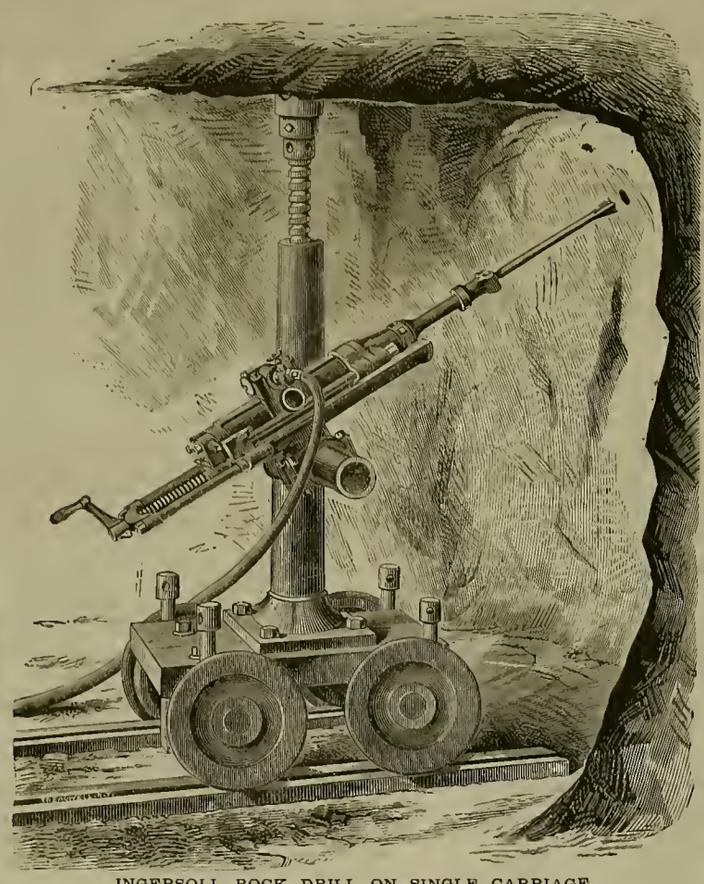
Recently a convention was held of the authorities of miners' permanent societies and others interested in movements for relieving distress occasioned by accidents in mines. The central society formed of these authorities has a council representing the various mining districts, and the Vice-Presidents include the Marquis of Bute, Lord Derby, Lord Fitzwilliam, Lord Durham, Lord Wharncliffe, Lord Lathom, Lord Halifax, Lord Tredegar, Lord Aberdare, Lord Gerard, Lord Richard Grosvenor, Sir Geo. Elliot, M. P., and other mine owners. The objects of the association are to promote the formation of societies in districts where they do not exist, to watch parliamentary actions concerning industrial assurance, to inquire as to surplus relief funds, and to carry out plans for reassuring the risks of permanent societies. Mr. G. L. Campbell read the annual report of the Central Association formed of the miners' permanent societies in operation in Northumberland, Durham, North Staffordshire, Lancashire, Cheshire, the West Riding of Yorkshire, the Midland counties, North Wales, Monmouthshire and South Wales. A table of the position of these societies showed that, during the year 1881, the members had increased from 129,815 to 142,417; the accumulated funds had increased from £133,078 to £149,267; the revenue had increased from £97,891 to £105,509; the number of widows receiving annuities had increased from 864 to 1,031; the number of children in receipt of relief had increased from 1,830 to 2,118, and the "disablements" had increased from 22,153 to 23,542. The societies had had peculiar difficulties to contend with in 1881, owing to the coming into operation of the Employers' Liability act; but these difficulties had not impeded the growth of the societies.

The advantages of these societies are fully recognized by the men, and they are rapidly increasing. At the present time there are two-thirds, at least, of the coal miners who subscribe to them weekly. These payments, as a rule, are supplemented by a percentage on the part of the employers, by which means a large yearly income is insured. But it has been considered that there is a third party that might well be called upon to contribute to these funds, and so increase their value to those who are benefited, or may be, by them. These are the lessors or royalty owners, who derive large revenues without running any risk whatever, and in this respect differ very much from the lessees. It is stated by an authority on such subjects, that if only one farthing per ton was returned on all coal paid rent for and raised in the United Kingdom, there would be an annual revenue from the royalty owners of no less than £156,000, and this would give five shillings a week to 12,000 persons; so that, with the added contributions of the masters and the working miners, an ample provision would be made for every man, woman and child connected with the great coal mining industry of Great Britain, under any and every contingency.

In this country there are now so many fraternal societies that "class societies" have not come into vogue. The fraternal societies which have the insurance feature are rapidly increasing, and are doing great good in a quiet and unostentatious way. Men with families everywhere join them, and thus by mutual efforts furnish a cheap insurance, which has the added advantage that the payments are in installments, and of amounts so small as not to inconvenience even a day laborer.

The Ingersoll Rock Drill.

The engraving shows an Ingersoll rock drill mounted on a single car for tunnel work. The Ingersoll rock drills are so well known as to need no detailed description. The number of necessary parts has been reduced to a minimum, thereby giving the machine a great advantage in cost of repairs and consequent saving of time. That the work of the drill is effective is evidenced by the wide application, especially where the works are of any magnitude. On this coast it is in use in many places. As will be seen by card in another column, Messrs. Parke & Lacy, of this city, are the sole authorized representatives of the Ingersoll Rock Drill Company. The rock drills and air compressors are now for sale at the Berry & Place Machine Co., Parke & Lacy, proprietors, 323 and 325 Market street.



INGERSOLL ROCK DRILL ON SINGLE CARRIAGE

THE MECHANICS' FAIR.—The Mechanics' Institute fair was opened this week. Thus far the attendance has been good, though the exhibits are not yet all in order. The arrangement of the building is better than formerly, and everything will be in good running order in a day or two.

LEAD keeps well up, and Salt Lake maintains its prestige as a good market for miscellaneous ores. The receipts and shipments are heavy, and the year's work will show an increase of 50% over last year's yield, unparalleled as that was up to that time.

AT Silver Reef the new development in the Tecumseh of an ore body shown up for 80 ft. in length and six feet in width, assaying $100 per ton, gives renewed confidence to the operators in the district.

THE 60-stamp mill of the Boston & Montana Co.'s Gloster mine, Montana, crushes about 75 tons of ore a day. The mill works automatically to such an extent that only five men are needed to run the shift, and all parts of the ponderous machinery work with a precision and perfection that would delight any beholder. The appearance of the vast building at night is unusually brilliant. Three Wesston electric lights make the region at night almost as bright as the day. The last brick from the Gloster, shipped the 23d ult., was valued at $14,400.

A NEW MINING DISTRICT.—Down in Douglas county, Nev., at a miners' meeting held on Saturday last, at the Holbrook mine, a district was duly organized, and D. W. Fish elected Recorder. The new district extends from Silver lake on the north to Silver Glance on the south, and is called the Red Canyon mining district, and embraces all the mining region of Burbank, Red Canyon and all the mining country east of the range as far as Smith's valley.

THE most important event in the history of the Salmon River country since the striking of ore there is the sale to Salt Lake parties of one-half interest in the Ramshorn mine, Bay Horse district. The deal includes the Ramshorn, Utah Boy, Post Boy and Montreal, and is, without doubt, one of the great mining properties of the country.

THE big stone debris dam on the Yuba river, above Smartsville, will be built, enough money having been raised to go ahead. A road leading to the site has been completed, and the plans for its construction are adopted.

CONSTANT improvements are going forward throughout the Wood River country, in the way of new roads, additional hoisting works, etc.

Chances of Finding Mines.

Twenty years ago, a good many people thought that a few more years would exhaust the area on this coast, suitable for prospecting. Ten years ago, a great many more people thought that the area was circumscribed; but within the past two years larger tracts have been opened than ever before. The wide regions in Arizona, New Mexico, Idaho and Montana, which have been overrun by prospectors within the past year or two, have shown up a very large number of leads. Montana and Idaho were considered some years ago as about played out for miners, yet they are more prosperous to-day, than they were even at that period or ever before. Arizona and New Mexico, of course, are newer regions and have offered wider fields and attracted larger populations, though now the tide of prospectors has turned northward.

Here, in California, even, scarcely a day passes that new discoveries are not made, and the prospector, by no means, finds it a barren field. The limit of areas on the Pacific slope, which are unopened by the prospector, are, of course, being gradually reduced, but there still remains much country which, for all practical purposes, is still unknown to the miner.

It is not enough for his purpose that nearly all parts of the country are, even when not settled up, occasionally visited by hunters, stock men, etc., or run over hastily by people not seeking precious metals. Every day fresh discoveries are being made in places which have had a small population in the vicinity for years, and we have no reason to assume that a tract contains no gold, silver, lead, coal or quicksilver, because up to the present time it has not attracted the attention of the miner. The prospector has not to travel far to find new country, and in the neighborhood of older mining districts there are many tracts yet undeveloped. Moreover, there are many claims which were abandoned years ago, before perfect appliances for saving the precious metals were thought of, and when labor and food was high.

It is, moreover, by no means certain that because other prospectors have passed over ground that there is nothing to be found. Many of us remember instances where ground was supposed to have been thoroughly prospected, and after, perhaps, a hundred different men had gone over it, another man would come along and strike it rich. The writer recollects having camped in one locality a week with three other prospectors, and thoroughly worked over a small section, finding nothing. Two weeks after two men camped at the same spring, and found a vein cropping out, which, after working about three years, they sold for $130,000. This vein was not 200 yards from the spring where the camps were located, and the first party had passed over the croppings, which were small, many times without seeing them. This is by no means an isolated case.

Many old miners, however, prefer to work and re-work well-known gulleys and flats rather than spend their time in making trials in new ground. It is often stated that in new camps, the miners, curiously enough, almost always accidentally open the richest claims first; but those who make this statement do not always take care to examine the facts. At first any new discovery—the finding of any rich pocket—excited the public mind, and even without exaggeration, the facts made known in the early days of our gold mining were startling; but more extraordinary results are obtained now, week after week, than many which occurred in early days.

THE mines in the Big Smoky country, Idaho, yield both milling and smelting ores, and the number of them large, the galena and milling ores being of very high grade. Several sales are negotiating, which, if consummated, will cause their hasty development. In the near future mills and smelters will be reducing the ores and shipping quantities of bullion.

THE gross product of the Ontario silver mining company, of Utah, for the month of July was $260,847.46, all silver.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Fresno Flats Mines.

Editors Press:—There is quite a mining excitement in this vicinity, owing to the discovery of large deposits of argentiferous galena ores on the east side of Mt. Raymond, situated on the line between Fresno and Mariposa counties, about six miles south of the Yosemite stage road.

The first discovery was made by Ghann and Willoughby, and subsequently by Harlow and Nihlock, a mile farther south. The ores assay from $40 to $300 per ton in silver, and about 50% in lead. The country rock in which it is found is porphyry.

On the Willoughby claim, which I visited, I think 1,000 tons could be picked up from the surface. There has been little work done, and there is no surface indication of a vein. The porphyry appears to he the only gangue that accompanies the galena, and little, if any, soft carbonates have been ehown; hut when these deposits are uncovered or explored, the ore may he found in a more favorahle condition. As it is, if tbe oree can he easily emelted, the discovery is a very important one to this part of the country. Wood and water are abundant.

A Miner.

Fresno Flats, Aug. 8, 1882.

The Nichols Bonanza.

It was stated in the *Union* yeterday that another $75 pocket had been found in the Nichols & Russell claim, and that the indications were good for anotber find. The owners were not disappointed, as on Thureday the workmen came upon a very rich pocket, from whioh about $500 in gold was taken in a very short time. A *Union* reporter paid a visit to the claim yeeterday, and was shown some of the richest specimene ever taken out in this district. One pieee, weighing six ounces, was estimated to be fully three-fourths gold in weight, and was a handsome thing to look at. The indications yesterday were that another rich pocket was near at hand, as the prospect, by panning, was splendid, and the owners were almost certain that a few houre' work would hring them to another rich deposit of the precious metal. The Nichole claim is an old one, the surface baving been sluiced off yeare ago, and it hes alwaye paid nicely. Those who worked the top ground supposed that their pay came from the red dirt on top, but it ie quite evident that this was a mistake, and that their gold came from the small stringere of quartz which run through the ground in all directions. Ths stringer upon which the men are now at work is only about an inch in width, and where the pockets are found the ledge is nearly all gold. Several feet will be run, at times, without finding anything, but when a pocket is found, it paye well. The deepest workings on this little honanza are only ahout 25 ft. below the surface, and the ground ie so wet that they cannot go any deeper without the aid of a pump. The owners intend to pipe tbe whole of the ground away next winter to a depth of 25 or 30 ft., aud will, by that means, procure the gold contained in all the small stringers. Thie rich little claim is situated only ahout one and a half miles from town, a little to tbe left of the old Rough and Ready road, and the finding of eo much gold should certainly stimulate prospecting in that neighborhood, as it is evident that a large and rich ledge exists somewhere in that vicinity.—*Grass Valley Union.*

Idaho's Advancement.

The Vienna *Reporter* says: A few years ago a quartz mill, even of small capacity, was a curiosity in any portion of Idaho outside of Owyhee county. There were several at Silver City, but at any of the other mining districts not to exceed 20 or 25 etamps were at work. But, during the past five years, machinery has come in to considerahle extent, each year adding a few mills to crush the ores of the great mineral helt of southern and eastern Idaho; smelters, to work the base bullion heretofore considered worthless, on account of distance from railroads. Flouring mills have been erected to grind our wheat; reapers, thrashing machines and all farming implements of the latest patterns added to the farms. Saw mills are cutting our lumher, and hundreds of other enterprieee etarted and carried on eucceeefully that are too numeroue to mention here. No other Territory, with the probable exception of Montana, hae advanced so much during the past five yeare. No failnres have been reported from mining companies putting up machinery, which epeake in terms broader than worde for our minee. The mines have hecome eo well known that capital ie eeeking investment among ue, and right here we feel diepoeed to caution the men holding proepecte againet holding them at too high figures. A prospect worth $5,000 or $10,000 will not sell for $25,000, and thie faot ehould he borne in mind. A mine is like any other piece of property or merchandise, worth juet what it will bring, and no more. Capitaliste are willing to pay for a mine or proepect all it is worth, hut no more. Bear thie in mind.

Purification of Precipitated Copper.

In the various processes for the extraction of copper hy what is known as the humid method, the copper is usually precipitated hy immersing in the cupreous solution scrap iron, sponge iron, or cast iron. The precipitated copper thus thrown down ie in almost all cases contaminated hy the presence of varying quantities of arsenical compounds. In the suhsequent smelting of euch precipitated copper, the removal of the arsenicel compounds is accomplished with difficulty, and an inferior quality of copper consequently results. The invention of Mr. Frederic Claudet, of Coleman street, has for its object the removal of the arsenical compounde from the precipitated copper previous to emelting the same, and the consequent more ready production of ingot or cake coppsr free from arsenic. For thie purpose he either treats the precipitated copper when in the wet state or condition, as ohtained from the precipitating vats, or when it exists in a partially or completely dried state or condition, with a eolution of caustic or carhonated alkali, or with mixtures of the same.

He prefers, for this purpose, to employ a solution of caustic eoda, or a solution of carhonate of soda, or a mixture of the same, which solutions may he employed either at the ordinary or at an elevated temperature. It will, however, he understood that the corresponding alkaline potassium compounds or mixtures of the same may also he employed. By this meane the arsenical compounds existing in the precipitated copper are converted into soluble arsenical salts, either of soda or potash, which are removed from the precipitated copper hy the alkaline solution, and by eubsequent washing, either with hot or with cold water.

In some casee it is preferable to moisten the precipitated copper to he purified with a strong solution of a caustic alkali, or of an alkaline carhonate, or of a mixture of the two, as hereinbefore mentioned, and after drying the mass, to suhject it to a suitable heat in a muffle or other furnace. The arsenical compounds thus formed are consequently removed in the form of soluble arsenical ealts, either of soda or of potash, by lixiviating the heated mixture with water—by preference with water at an elevated temperature. The proportions in which tbe cauetic or carhonated alkalies are to be employed will be dependent upon the amount of the areenical compounds existing in the precipitated copper, but he has found that in treating ordinary Englisb precipitate made from Spanish or Portuguese pyrites, three to five per cent. of alkali, or its equivalent, gives good results. Other proportione may, however, be adopted, his object being to convert the arsenical compounds existing in the precipitated copper into easily soluble salts, in order that they may he removed, and that the copper may be obtained in a purer condition.

Quartz Mining in Idaho.

In 1862 placer mines were discovered at Florence, in northern Idaho. At that time Idaho was not known as a Territory, hut was a part of Oregon. A stampede followed the discovery, and thousande of men flocked to the new *el dorado*, only to be disappointed hy not getting an immediate fortune. The placers were exceedingly rich, and gave employment to a large number of men. The following year the placers of Boise basin, in Boise county, were discovered, and the excitsment created hy them was of broader extent than those of Florence. Not until thie eecond discovery was there any attention paid to hunting for qnartz. But this soon followed the discovery of the basin placers, and attracted immediate attention. Hundreds of ledges were soon located and put into the hands of sharpers to eell. They disposed to Eastern capitalists a large number of worthless mines, and the feilures, shortly after, of those companies, created a disgust among capitalists for mining, especially in Idaho. For 15 years thereafter, a man with an Idaho mine for sale could not ohtain an audience. But tbat time has passed away. It became known in mining circles six or seven yeare ago that there were quartz mines in Idaho Territory, and that they were good. Mining experts and men of means began to arrive in our midst and secure properties. Since the first notice was taken of the Territory after the decade, they yearly grew thicker, and our vast resources are hecoming known throughout the mining world. That our mines are the hest in the United States all old-timers know.

To save us from another backset, it is the duty of all local papers to expose all ewindling operatione and jobs put up in the intereet of individuals to the detriment of the country, and aseiet all worthy enterpriees. Thie is the couree of the *Reporter*. By helping the country in general we help oureelvee.—*Vienna Reporter.*

Prof. Sumner eays the whole philoeophy of wagee wae etated in a few worde hy a workingman a few yeare ago, and no economist can improve what he eaid: "I know when two hoeeee are running after one man, wagee are high; when there are two men running after one boee, wages are low." That embraces the ecience, theory and practice of the whole euhject.

Looks Bad.—The entire property, real and peresnal, of the State Line company at Gold Mountain ie advertised at eheriff's sale in the *True Fissure*. A euit wae brought to recover eome $17,000 hy Squiree, tbe merchant.

Calico Mountain.

Something about a New Mining District.

This mountain is eituated in San Bernardino county, on the 35th parallel of latitude, and Calico mining district is eituated in township 10 and 11 north, ranges 1 and 2 east, San Bernardino mountain hase and meridian. The mountain was named Calico on account of the great variety of colors of its soil. Blue, red, gray, green, vermilion, brown, yellow are distinctly seen in patches along the mountain's side, hesides a variety of other shades of color. In some places in East Calico portione of the hillsides look like segments of the rainbow, and have a heautiful appearance when the sun shines upon them in the morning or evening.

Experienced miners have passed through these hills many times in the past, hut they did not suspect there wae silver in them. The formations of earth are entirely different in most placee from the kinde in which they had heen accustomed to find it. There are large quantities of lava and rocks, made black by the action of fire and water, and immense deposits of porphyry and cbalky eoil, which, on examination, are found to contain eilver in ahundance. There is a vast amount of surface deposit, which assays very high and is easily milled. Sometimes parties who have not thoroughly examined the mines of this district think that when tbese deposits are thoroughly worked the eupply of silver will he exhausted; hut that such ie not the case can he easily proven hy examining the ore taken from mines that have been eunk to a depth of over 100 ft., where the veins become hroader and bold out in richness.

The fact is, we can challenge any mining district to produce as rich ore as can be found in this district, that has as rich eurface deposits and in such vast quantities. There isn't a miner here of any experience but that is surprised at the richness and extent of tbe mines. Where ie the spot compriein ae many mines that have paid well from their firet development, and will continue to do so? Unquestionably, the mines here cannot he excelled. With tbe necessary capital to develop them, they will turn out bullion to suoh au extent as to astonish the most expert miners.—*Calico Print.*

Mine Management.

In explaining a misstatement in a New York contemporary, the Georgetown (Col.) *Courier* says: Notwithstanding the fact that nearly all of the Clear creek minee now controllsd in New York paid regularly up to the time the change in management occurred, it is true that none of them have paid a dividend since then, and eome of them are hadly in debt. This etate of affairs has heen brought about by various causes. Some of them have continued to make money, hut have put their earninge hack into the ground, preferring to increase the value of tbeir properties rather than to pocket their earnings. Others were for several yeare outrageously managed and brought to the verge of bankruptcy, and for the past year or two have been elowly regaining lost ground. In all cases they are capitalized too high, and probably never will be ahle to pay a respecteble dividend upon their capital stock. But nearly every one of these New York properties at the time they were sold were capahle of paying from one to three per cent. per month upon the sums paid for them—not upon the sums the New York syndicates received—and had they been capitalizsd at their actual worth, and then worked in a sensihle manner, the purchasers would now he perfectly eatisfied with their investments.

But the Clear creek mines controlled in New York do not produce over one-third of the county'e annual output. The other two-thirds is produced hy mines owned hy individuals and close corporations, who manage their affeirs without noiee and with as much system as is shown by New York merchants in the transaction of their business, and to say that these men do not find the business profitable would be as great an absurdity as to say that tho importing husinss of New York does not pay. The fact that the net value of the ore sold and milled in thie county last year was ahout $1,750,000, which was produced by less than 2,000 men, a large percentage of whom were prospectors, is sufficient to show the absurhity of the statement.

The Denver *Republican* says: Col. Jim Whitlatch, of the Kansas mine, Montgomery district, starts for his home in Brooklyn to-morrow morning, to meet, as he happily expresses it, the wife and babies, from whom he has been estranged for the last eight months. During that time he has accomplished wonders, and the mine on old Mount Lincoln, nnder his guidance, has become almoet ae famoue ae the man whose honorahle name the mountain beare. Col. Jim ie looking ae hardy and rugged ae he did when firet he wended his way, many yeare ago, to Colorado. Hie hoete of friende give him a hearty ehake at parting, wishing him a eafe and pleasant journey and a epeedy return.

Big Bug.—A correepondent of the Arizona *Miner* eaye: Everything ie progreeeing finely in our camp. Smith is working a full force of men on the Platta Bonita, and has the ehaft down ahout 200 ft. During the latter part of last week, an extra two feet of fine high-grade ore wae added to hie pay streak. Stevens and Bette are puehing work on the Sterling. The ehaft hae attained a depth of 65 ft., and the level at that depth ie in 25 ft. to the eouth. The ore ie steadily increaeing in qnantity and quality.

Flameless Combustion.

At the soiree of the Society of Chemical Iodustry, at Owens College, on Thursday, a new theory of comhustion was practically illustratsd hy Mr. Thomas Fletcher, of Warrington, the results being so totally unexpected that many present would, and in fact did, go away with the impression that some deception was heing practiced. Mr. Jacoh Rsese, the inventor of the Reese fusing disc, has stated his helief that if it were possihle to produce comhustion without flame, the temperatures and duty ohtained from any fuel would he enormously increased. It has remained for Mr. Fletcher to not only prove the possihility of flameless combustion in more than one form, hut also to demonstrate practically the enormonsly high temperatures which can be ohtained hy this means. Taking a hall of iron wire, ahout three pounds in weight, Mr. Fletcher placed it on a slah of fireclay, and directing a blow-pipe flame on it for a few seconds, he suddenly hlew the flame out. The temperature increased so rapidly that in a few seconds the wrought iron fused and ran into drops, and thie temperature wae eteadily maintained. The room wae darkened, hut the closest examination did not show a trace of flame, although the fact that the gas was hurning was proven hy repeatedly relighting and extinguishing it. The same experiment was repeated in another form hy directing the flameless heat into a small fireclay chamber, in which a refractory clay crucible, made specially for nickel melting, wae partially fused and worked into a hall like soft putty, the sides of the fireclay chamher hsiog at the same time fnsed. The beat wae so tremendoue that the hlow-pipe laboratory, which was given up to Mr. Fletcher for the evening, was much too hot to be agreeahle, in spite of open windows and ventilators. How far this discovery can he utilized remains to he seen, but it would appear that the presenco of flame, usually considered to he a sign of combustion, is really an indication of imperfect reeults, and the best duty is to be ohtained only when flame is totally ahsent. It is certain that such temperaturee as obtained hy Mr. Fletcher without flame have never previously bsen ohtained with the fuel used, which was nothing more than a small gas supply from a quarter-inch pipe, assisted by an air hlast. As regards the soiree, the society may be considered a promieing infant. It is under a year old, and ahout 1,700 were present on Thursday, the building being inconveniently crowded. The meeting next year is to be in London, the president for the year heing Mr. F. A. Abel, C. B., F. R. S., of the Royal Arsenal, Woolwich.—*Warrington Guardian.*

Sawtooth Mines.—In a letter to the Wood River *Times*, a correspondent says: I returned from the mines agreeahly impressed with the evidences for maintaining, in the near fnture of this section, several hundred miners and a prosperous town. The oree of the Sawtooth mines are very similar, heing mostly ruhy silver, with a psrcentage of gold and of sulpbatee. The veine are fissures in granite formation, and improve in width and grade as depth is attained. Many locations have been made over an area of several miles, which are yet undeveloped, further than to ascertain the grade of ore—all of which runs higb. The ore of the district ie not very dissimilar from the Monarch and Atlanta mines, on the Atlanta lode, which have heen operated many years. The mines are opened for securing ore to hut a limited extent as yet, although considerable has accumulated and is ready for working. The Columhia and Beaver mill is the only oue in the district. It will he ready to start up ahout August 10th. The machinery is all set, and nearly all parts of the mill are ready, except the leaching tuhs.

The Mining Outlook.—Our reporter sought an interview last night with Hank Smith, who went helow this morning, to find out what his impressions are with regard to the condition of mining in this neighborhood. He is an experienced miner, end what he says is worth repeating. He has traveled over a great deal of mining country in the last 12 months, bnt he says he would rather pitch hie tent in Eureka than in any other place he has struck yet, not excepting California, Sonora or the Comstock. He says there are great opportunitiee here for developing big mines, and he is surprised that capital has not heen induced to invest here more freely and undertake systematic prospecting on a larger scale. He would be satisfied to try his fortunes here.—*Sentinel.*

The prospects of Tucson, says the Arizona *Citizen* of August 4th, hecoming the chief shipping point in Arizona for copper bullion are very promising. Silver Bell, the Old Hat and the Santa Rita copper minee are all tributary to Tucson. There are already four smeltere in operation and two more are being constructed, and the mines are looking hetter thau ever hefore.

Mr. Jas. Campbell, who has a copper smelter lying at Maricopa, and who owns a copper mine in Castle Creek district, is now in Prescott, and will take a look through our mountain districts. He is a well-poeted man, formerly of Colorado. He has a fine opinion of Prescott and vicinity.

Private lettere from the eecretary of the Utah Commiesioner, say this Territory ie exciting great interest in Colorado. Tl e capitaliste who have done eo much toward building up Denver, will turn their attention to Utah and Salt Lake.

MECHANICAL PROGRESS.

No Limit to the Demand For Machinery.

So long as any of the wants of humanity remain unsatisfied, and there is any desire for bettering the condition of individuals, so long will there be a demand for new forms of machinery. Old combinations will become useless and thrown aside, to be succeeded by different and more capable devices. In other words, improvements in machinery will only cease when the intellect of man ceases. There are those who, looking at the immense variety and power of the machines and engines in present use, are of the opinion that there is an overproduction in this particular, but a little reflection upon the proper sphere and scope of all machinery will show that this is almost an impossibility, and that the invention of a new combination of the mechanical powers, in almost every case, suggests the making of another, and that the gratification of one want creates several others, which are in their turn as impatient of being satisfied. New occasions arise which demand economy, either of material or time, while the increase in riches and the appointments of living presents new uses for the raw material, so that the inventive genius of each generation will continue to find ample scope for its exercise in supplying machinery to meet its peculiar requirements. Hence it happens that the appliances of our fathers, which were to them perfectly marvelous, are altogether inadequate to supply our needs, and those which satisfy us will be found just as useless to our children.

It is an admirable instance of the "eternal fitness of things," by which we are environed, that this demand for new styles of machinery finds its supply in the provision which has been made for an unlimited improvement in this direction. The simple machines are very few in number, and the mechanical powers which enter into their construction are only five, yet by combinations and remodelings new instruments may be multiplied without limitation. It is barely possible to exaggerate the advantages which arise from this provision, for the resources and enjoyments of mankind are much more greatly dependent upon machinery than all other things combined. Indeed, it is impossible to conceive how the present condition of the civilized world could have been attained without its aid. The superiority over the savage which civilized man possesses is due to the fact that, by his skill, he has not been left to work with his unaided muscle, but that he has pressed into his service all the powers of nature, and made them perform tasks and turn out manufactured products which, without machinery, would have remained unknown. It is in this realm that one race truly excels another, and, in comparison, prowess in arms is in nowise worthy of mention.

In this view of progression, perfection in machinery is unattainable, and, when spoken of, it is only a comparative term. Every machine yet made has been improved upon from time to time, and none of them are so perfect but that some one sees the need of, and will ultimately furnish an appliance which will do the work in a more satisfactory manner. But, notwithstanding this impossibility of absolute perfection, the value of any machine is gauged by the nearness with which it comes to being perfect and entirely serviceable to human convenience and welfare.

It therefore follows that no amount of money, or time, or study, should be considered as spent in vain by our artisans who devise machines for public use, since an adequate return will be made in the superior quality of the product which is manufactured, so that it will command not alone the home market, but will be able to find a ready sale in competition with foreign goods.

It is, perhaps, one of the greatest proofs of man's power, that he is thus able to evoke from his mentality an appliance of the mechanical forces which makes willing slaves of heat, steam, water, wind and electricity, which otherwise would exercise their own "sweet will," and subserve no other interests of humanity than those which the brute creation enjoye in common with it. To obtain the absolute mastery over these powers of nature is, perhaps, within the power of machinery, but the realization of this possibility is still far in the distance, even with the rapid strides that are now being taken to reach it.—*Industrial World.*

CHINESE STEEL.— A considerable steel-making industry exists at present in China, on the upper Yangtze, whence the steel is sent to Tientsin for shipment and distribution. It realizes much higher prices than the Swedish steel imported into the country. The Chinese metallurgists recognize three kinds of steel, viz., that which is produced by adding unwrought to wrought iron while the mass is subject to the action of fire; pure iron many times subjected to fire, and native steel, which is produced in southwestern China.

THE MECHANICAL EQUIVALENT OF HEAT.—Signori Cantoni and Gerosi have determined the mechanical equivalent of heat, by allowing a mass of mercury to fall from a hight and suddenly checking it at known distances, and measuring the increase of temperature at each distance. The mean results obtained agree closely with those obtained by Dr. Joule.

On Cracks and Annealing of Steel.

Master mechanics, locomotive superintendents and locomotive builders will be interested in the paper read before the Institution of Naval Architects by A. C. Kirk on this subject. If it does not completely upset, it at least throws great doubts on, the theory that the cracks which occur in steel boiler plates are due to unequal expansion caused by differences in temperature. The attempt has been made to give greater plausibility to this latter theory, by the suggestion that contraction concentrates the strain in the edge of the plate, and that when fracture begins it extends just as a sheet of paper is torn. Both of these propositions were tested by Mr. Kirk, and he was unable, with the specimens tested, to produce a sudden fracture, either by expansion and contraction or by concentrating the strains on the edge of the plate. His conclusion is, "that such cracks are simply due to lines of weakness in the plate, which annealing will not cure, although it may easily do harm."

The evidence as to the cause of cracking is, however, entirely negative in its character. He shows, or has tried to show, what the cracks are *not* due to, but we are still in the dark, so far as his papers are concerned, with reference to the question as to what it is that causes "the lines of weakness." If his theory is correct, then the next step will be to show how to prevent such "lines."

Mr. Kirk recommends that before plates are put into a boiler they should be severely "knocked about," and thus weak places might be discovered by the fracture of the plate, whereas if the weak places do not exist, the "knocking about" will not hurt them. The soundness of this view seems to be supported by his experiment, and it certainly would be best to run the risk of occasionally fracturing some plates which are sound, in order to discover those which are defective.

Welding by Pressure.

At a recent meeting of the Physical Society, London, Professor W. Chandler Roberts communicated the results he had obtained in repeating the experiments of M. W. Spring, Professor at the University of Liege, on the union of finely divided particles of metal by pressure. M. Spring had shown that at a pressure varying from 5,000 to 7,500 atmospheres, metallic filings may be united into coherent disks. Thus, at a pressure of 6,000 atmospheres, bismuth filings may be united into a disk, which has a crystalline fracture, and a density which is identical with that of the metal cooled from the molten state. Zinc, again, also a very crystalline metal, will weld into a disk at a pressure of 7,000 atmospheres, 105,000 pounds to the square inch, and the metal will even "flow" into cracks between the die and the collar surrounding it, just as in the experiments of M. Tresca, lead "flowed" under similar circumstances. Professor Roberts had repeated and confirmed many of the experiments of M. Spring, whose more recent results are of special interest, as he has shown that if filings of bismuth, lead and cadmium be mixed in suitable proportions, such, for instance, as in Wood's alloy, and if the mixture be submitted to a pressure of 7,500 atmospheres, 112,500 pounds to the square inch, an alloy is obtained which will actually fuse at 70° C., the true fusing point of Wood's alloy being 63° C. Professor Roberts showed to the society an alloy he had prepared, which melted below 100° C., although of the constituent metals the lowest melting point is 230° C., and he pointed out the great interest, both to the physicist and metallurgist, of M. Spring's results.

THE HARDENING OF VULCANIZED INDIA-RUBBER.—In the opinion of Mr. W. H. Hempel, the hardening of vulcanized india-rubber which takes place with piping and other rubber goods after having been in use for a short time, is caused by the gradual evaporation of the solvent liquids contained in the rubber, and introduced during the process of vulcanization. Mr. Hempel has made experiments for a number of years in order to find a method of preserving the india-rubber, and he now finds that keeping the articles in an atmosphere saturated with vapors of the solvent answers the purpose. India-rubber stoppers, tubing, etc., which still possess their elasticity, are to be kept in vessels containing a dish of petroleum. The use of wooden boxes is objectionable; air-tight vessels alone being sufficient to preserve the india-rubber for any length of time. Exposure to light should be avoided as much as possible. Old and hard india-rubber may be softened again by subjecting it to the action of vapors of bisulphide of carbon. As soon as the article has become soft, it should be removed from the bisulphide of carbon atmosphere, and kept in the above way. Hard stoppers can easily be made fit for use again in this manner, but it is said that the properties of tubing cannot well be restored.

THE tensile strength of glass has been shown to be between 2,000 and 9,000 lbs. per square inch, and the crushing strength between 6,000 and 10,000 lbs. per square inch. By trials a short time ago, M. Traulionie found that flooring glass one inch square and one foot between the end supports broke under a load of 170 lbs.

INVENTOR OF THE SAW.—Pliny tells us that Dædalus invented the saw. The earliest sawmill of which we have mention was built at Madeira in 1420.

SCIENTIFIC PROGRESS.

HAS THE MOON AN ATMOSPHERE?—The Providence *Journal*, in an article on the planetary attractions for the month of July, says in regard to the probability of the moon possessing an atmosphere: The moon just now is an important member of the solar family. Something new may be anticipated in her monotonous story. The observers of the recent solar eclipse detected imitations of an atmosphere on her apparently lifeless surface. This seems to confirm indications of movement that have never been accounted for, and scarcely credited in scientific quarters. Two days after the eclipse, an observer of 40 years' experience, while looking at the moon, saw a cloud 100 miles long and 40 or 50 miles broad, hovering over the "Mare Crisium," presenting a misty, feathery appearance, unmistakably different from other portions of the moon's disc. If this appearance was a reality and not an optical illusion, other observers will be sure to detect something similar. * * The moon comes in for her share in the novel celestial problems that are the delight of the scientific mind. Indications of an atmosphere, observed by the French astronomers, and a misty, feathery cloud floating over one of her huge craters, revive the interest in her desolate face, and suggest the possibility that life may exist, in some form, in a world that seems to have played her part in the material economy of the universe.

SHORTNESS OF TIME IN DREAMS.—One of the most remarkable phenomena connected with dreams is the shortness of time needed for their consummation. Lord Brougham says that, in dictating, a man may frequently fall asleep after uttering a few words, and be awakened by the amanuensis repeating the last word to show he has written the whole; but though five or six seconds only have elapsed between the delivery of the sentence and its transfer to paper, the sleeper may have passed through a dream extending through half a lifetime. Lord Holland and Mr. Babbage both confirm this theory. The one was listening to a friend reading aloud, and slept from the beginning of one sentence to the latter part of the sentence immediately succeeding; yet, during this time he had a dream, the particulars of which would have taken more than a quarter of an hour to write. Mr. Babbage dreamt a succession of events, and woke in time to hear the concluding words of a friend's answer to a question he had just put him. One man was liable to a feeling of suffocation, accompanied by a dream of a skeleton grasping his throat, whenever he slept in a lying posture, and had an attendant to wake him the moment he sank down. But though awakened the moment he began to sink, that time sufficed for a long struggle with the skeleton. Another man dreamt that he crossed the Atlantic, spent a fortnight in America, and fell overboard when embarking to return; yet his sleep had not lasted more than 10 minutes.

DISCOVERY OF MONT BLANC.—Mont. Blanc, the highest of the Alps, is, strange to say, a modern discovery. At least, no mention is made of this colossus of European peaks in any itinerary, or in any literary work whatever till recent times. M. Charles Durier, in his work "Le Mont Blanc," says: "This mountain rises in the center of the most populous and civilized states of Europe; it is, in fact, the axis around which European civilization has revolved and still does revolve; its hight is considerable; it dominates everything in its vicinity, and, to make its appearance more striking on the background of the blue sky, its summit, though placed in a favored, temperate latitude, is ever covered with a mantle of snow. And yet, during 20 centuries, no historian, no traveler, no *savant*, no poet names it, or so much as alludes to it. As the sun describes his daily track, that peak throws its shadow upon at least three countries possessing different languages, but still it was profoundly ignored." The same author informs us of a map of the region round about Mont Blanc, published in the second half of the 16th century, but which gives no hint as to the existence of the mountain, which, nevertheless, is visible from all sides at distances of 60 leagues. —*Popular Science Monthly.*

A GALVANOMETER FOR ELECTRIC LIGHT CURRENTS.—At a recent meeting of the Society of Telegraph Engineers and Electricians, England, a paper was read on a new galvanometer for measuring the most powerful electric light currents. The action of the instruments is based on the *nil* method of testing—that is to say, reducing the deflection on the scale to *nil* by means of adjustments. The galvanometer consists of an astatic needle placed within two independent circuits, one a coil of long, fine wire, and the other a coil of short and very thick wire, which, in fact, is a stout loop of brass in some forms of the apparatus. Through the short, thick coil, the electric lighting current to be measured is passed, and through the long, fine coil is passed the current from a single-standard Daniell cell. Resistance is included in the latter circuit until the two currents balance each other by differential action on the needle, and the deflection of the latter is reduced to *nil*. Then, by means of a constant or multiplier found for the instrument in question by experiment, the strength of the powerful current in amperes can be obtained.

THE DETERMINATION OF SULPHUR IN PYRITES.—A process affording an accurate and expeditious means of determining the quantity of sulphur in pyrites consists in the following modification of the usual potassium chlorate method: A small amount of finely-ground pyrites—half a gram, for example—is mixed in a large platinum capsule with the well-known mixture of six parts sodium carbonate and one part potassium chlorate. The mixing is effected with a platinum spatula, and is then made more complete by gentle rubbing with an agate pestle fixed to a wooden handle. The whole is then fused over the blast lamp and treated with water. The solution so obtained is poured into a beaker containing an excess of hydrochloric acid, and is finally filtered. To the heated filtrate hot barium chloride is added, and a gentle heat is then applied, until the liquid above the precipitate has become clear. The burnt ores in sulphuric acid works have been for a long time assayed for sulphur by this process, which has, in every case, given satisfactory results.

MIXTURE OF GASES BY DIFFUSION.—The fact that gases do not mix very rapidly by diffusion alone may be strikingly illustrated by placing a strip of white paper, moistened with acetate of lead solution, inside a tall glass-stoppered cylinder, so that when the latter is inverted the paper extends from the bottom (which now forms the upper end) not more than one-third of the total length of the cylinder. A solution of sulphureted hydrogen in water is then placed in the bellow stoppor of the cylinder, and the stopper is inserted loosely into its place. After about 10 or 15 minutes the production of sulphide of lead on the white paper shows that the sulphureted hydrogen has risen two-thirds of the hight of the cylinder. Papers moistened with starch, iodide of potassium and chlorine water may respectively replace the lead acetate paper and the sulphureted hydrogen water.

SCIENCE ON THE STAGE.—It is proposed to try a novel experiment at Paris, by producing a series of scientific dramas at one of the theaters, with the object of combining amusement with instruction. Three plays have already been provided, and their titles clearly indicate the direction in which the audience is to be instructed. The titles are: "Denis Papin, or the Invention of Steam;" "Kepler, or Astronomy and the Astrologer," and "Gutenburg, or the Invention of Printing." The result of this new dramatic venture will be awaited with interest. Its success may be the inauguration of a new era in science teaching.

THE ODOR OF CEDAR.—The pleasant odor of cedar, according to Mr. E. Lewis, appears to be as persistent as the wood itself. Slivers taken from white cedar stumps found 12 ft. under water at low tide, near the Narrows entrance to New York harbor, had the odor of the newly grown wood, and a piece not more than twice the size of one's finger perceptibly scented a drawer for more than a year. "It is certain," says Mr. Lewis, "that the coast, where the trees of which these are the stumps grew, has since undergone a depression of 18 to 20 ft.—an event which may have occupied as many centuries."

WATER IN FLESH.—Analyses have been made by Prof. C. Virchow of the amount of water and extract in the flesh of different animals, with the view of obtaining some general data for the introduction of a method whereby the value of meat might be determined. The differences were so slight, however, that no results of any value were secured. Veal contained more water than beef, lean beef had less than well-fed beef, and unhealthy meat a greater amount than sound meat. The same holds good for the extract.

SOME French chemists have succeeded in obtaining oxalic acid from the waste of shoemakers' and saddlers' shops, and others where leather is used; also from woolen rags, horn, hair, etc. For this purpose these residues are treated with one part of sulphuric acid and four of water, and the mass thus obtained is subjected to the action of one part of nitric acid and three of water, at a temperature of about 80° Cent. From the digestion of this oxalic acid is easily extracted.

PROGRESS IN MICROSCOPY.—Two microscopes, called the "Jumbo" and the "Midget," formed an interesting exhibit at a recent meeting of a London society. The former instrument, probably made about half a century ago, was 4½ ft. high and weighed 125 lbs., while the "Midget," fully equipped for work, had a total hight of only four inches, and weighed but a few ounces. Six of such microscopes as the smaller one could be inclosed in the eye-piece of the larger.

GLASS FOR TABLE TOPS.—A new use for glass has recently been developed in its substitution for marble tops of tables and dressing cases. A Pittsburg firm has turned out slabs of glass that are said to be a perfect imitation of the latter material, while they admit of decorations of various designs, both in form and color.

THE ASTEROIDS.—The number of the known members of the small planets is now 225. Palisa, of Vienna, discovered the last one on April 19th.

AN Antarctic expedition to Cape Horn is being fitted out by the French government. It will be furnished supplies for 18 months.

Mining Share Market.

Mining stocks have not been very active, although there has been some movement during tho week, as our stock tables show. The Virginia *Enterprise* thinks that the indications are that lively times will he seen in the mines of the middle part of the lode at no distant day, as operations are now in progress there (at the Chollar-Norcross-Savage shaft) which must soon bring them to the front. The new drift will open up some interesting ground, and will allow of a resumption of operations in all the middle mines. It will not he long before all these mines will he working throngh the Combination shaft, in which they have a joint interest. There will he little use for any of the old works once the dip of the vein has carried it forward to a point near the new shaft.

At the north end there is no special change this week at any point. The ore at the Mexican winze will soon have passed to the eastward, where it will probahly not he seen again until cut on the 2900 level.

The raise from the 2700 level of the Union Con. will connect with the stopes of the 2600 level the first of next week. These stopes are yielding the usual amonnt of ore.

At the Sierra Nevada they will presently he in a position to do a great deal of prospecting on the 2700 level in the northern part of the mine.

Active operations will soon he resnmed in the Gould and Curry and Best and Belcher in ground that promises well.

At Gold Hill a good deal of ore is beginning to he extracted hy the Crown Point, Belcher and Yellow Jacket.

According to the statement of the Assessor of Storey county, Nevada, the yield of the Comstock mines for the quarter ending June 30, 1882, was as follows:

Mine or Company.	Tons.	Gross Yield.	Cost.
Union	7,936	$243,336.56	$217,044.00
Belcher	4,000	67,445.03	65,501.25
Crown Point	11,100	156,702.11	150,700.26
Kentuck	1,150	20,826.60	10,700,00
Challenge	122	1,635.50	1,830.00
Imperial	724	10,963.60	10,760 00
Confidence	84	1,167.60	1,260 00
Totals	25,116	$510,236.22	$466,804.51

A Superb Resort.

A more delightful summer and autumn resort can hardly he conceived of than that of the Blue lakes, in Lake county. The scenery is rare and picturesque as yon approach the lakes hy an easy and delightful drive of 12 miles from Lakeport, through Scott's valley, on the east, or of 18 miles from Ukiah, on the west. The water is deep and clear, and in the warm season, captivating and healthful for bathing. For fishing and deer hunting the place is superior during the proper seasons. Mr. Theodore Deming, proprietor of the hotel, is a farmer, and one of the oldest subscribers of the PACIFIC RURAL PRESS, and, with its publishers, believes in the true principle, that "whatever is worth doing, is worth doing well," and also practices his good faith in his farming, horticulture and hotel keeping. Mrs. Deming, in the matron's "pleasant home department," is not less thorongh and successful. The place is naturally an admirable one for a popular resort, and wo should he pleased to present our readers hereafter with engravings of some of the most beautiful of views snrrounding these ever charming lakes. Visitors to Lake county miss much who fail to take in the Blue lakes.—*Pacific Rural Press.*

Recent Contributions to the California State Mining Bureau.

[Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

4110. Silver Ore—Legal Tender mine, Grant county, New Mexico.

4111. Silver Ore (?)—True Blue mine, Mono Lake district, Mono county, Cal.

4112. Porphyry—Seventy-five feet thick. Bodie mines, Mono county, Cal. Hon. Joseph Wasson.

4113. Silicified Wood—Twenty feet below the surface. San Luis Obispo county, Cal.

4114. Native Bismuth—Sorata, Bolivia. Melville Attwond.

4115. Bisunthene—Sorata, Bolivia. Melville Attwood.

4116. Crude Petroleum—Near Spanishtown, San Mateo county, Cal. L. Ries.

4117. Silver Ore (?)—Lake district (?), Cal.

4118. Gold Ore—Ore Fino mine, Fresno county, Cal. Mr. Blanding.

4119. Chalcopyrite (Yellow Copper Ore)—Beveridge district, Inyo county, Cal. T. McDonough.

4120. Gold in Cellular Quartz—Beveridge district, Inyo county, Cal. T. McDonough.

4121. Mineral Wool—Slag blown from the tuyeres of an iron furnace. This material much resembles the peculiar lava known as Pele's hair, which is fluid lava blown into threads by the wind. It is found at the volcano of Mauna Loa, Hawaii, Sandwich Islands. F. E. Monteverde.

4122. Piece of Limestone—Worn smooth by the hands of miners. Eulalia mine, near Chihuahua, Mexico

4123. Minium (Red Oxide of Lead) and Vanadinite (Vanadate of Lead)—Picket Post, Pinal county, Arizona.

4124. Pyrolusite (Binoxide of Manganese)—Knopp's ranch, near Columbia, Tuolumne county, Cal. Found on the surface in bowlders, from the size of grapes to 100 lbs. in weight

4125. Silver Ore—Hackberry mine, Mohave county, Arizona.

4126. Molybdenite (Sulphuret of Molybdenum)—Fresno Flat, Fresno county, Cal. Wm. Speckerman.

4127. Quartz Crystals—Milky, doubly terminated. Warstein, Westphalia. J. Z. Davis.

4128. Silver Lead Ores—Beveridge, Inyo county, Cal. T. McDonough.

4129. Silver Ore—Silver King mine, Myers' district, Arizona. F. E. Monteverde.

4130. Silver Ore—Psuamint, Inyo county, Cal.

4131. Silver Ore—Sitka, Alaska.

4132. Brecciated Rock—Coal mine, Eureka county, Nev. Hank Mitchell.

4133. Producta (Carboniferous Fossils)—Coal mine, Eureka county, Nev. Hank Mitchell.

4134. Silver Ore—Ella Blossom mine, Prescott district, head of Bloody canyon, Mono county, Cal. R. H. Brady.

4135. Cinnabar—Separated in refining sulphur. Sulphur Bank, Lake county, Cal. (See No. 4030.)

4136. Silver Ore—Silver Cliff mine, Wet Mountain valley (?), Colorado.

4137. Copper Ore (Chalcopyrite)—Near Lexington, Santa Clara county, Cal.

4138. Bituminous Coal—Ratoon mountains, New Mexico, S. Heydenfeldt, Jr.

4139. Magnetite Crystals (Perfect. Octahedrons)—Shasta county, Cal. B. B. Minor.

4140. Nodule of Pyrite—Found with silver ore. Iron mountain, Shasta county, Cal. R. H. Sinton.

4141. Silver Ore—Ellis mountain, Esmeralda county, Nev.

4142. Nodule of Sandstone (heart-shaped)—Lorenzo river, near Santa Cruz, Santa Cruz county, Cal. J. Z. Davis.

4143. Quartz Crystal (Smoky)—Beveridge, Inyo county, Cal. T. McDonough.

4144. Portion of a Strap or Band—Showing the method of fastening used in hydraulic mining pipe, to strengthen weak parts and to allow slip at the joints.

4145. Crude Argols—Krug's vineyard. St. Helena, Napa county, Cal. S. P. Connor.

4146. Serpentine—Monterey, Monterey county, Cal. J. Z. Davis.

4147. Calcite (Limestone)—Santa Cruz county, Cal. J. Z. Davis.

4148. Iron Ore (Limonite)—Near Latrobe, El Dorado county, Cal. Vein, 20 ft. wide. Plenty of wood, water and limestone. Analysis: Sesquioxide of iron, 78.27; protoxide of iron, 0.80; silica, 6.51; water, 14.75; sulphur, 0.37; phosphorus, 0.02; total, 100.92; metallic iron equals 55.41%.

THE Eureka *Sentinel* says: "Some crude hullion, containing silver, with several hase metals, has been sent from the Geddes & Bertrand mill to Salt Lake City, to determine whether it will he cheaper to have it refined there than here. If it can he refined at Salt Lake for the hase metals that are separated and saved in the process of refinement, it will be more economical to have the refining done there."

DURING the week ending Augnst 5th, there were shipped from Salt Lake 37 cars of hullion, 803,882 lbs., sent East; one car of lead, 24,081 lbs., and four cars of copper ore, 122,840 lbs., sent West; two cars of copper matte, 40,600 lbs., and one car of copper hullion and matte, 25,025 lbs., sent to Baltimore; making a grand total of 45 cars, aggregating 1,016,428 lbs.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

HAZARD.—Amador City *Ledger*, Aug. 12: In the Hazard tunnel, at a distance of 600 ft, a large body of ore has been struck. The west wall has not been found, so no one knows how thick the ledge may be. The quality is good; assays give over $20 per ton. The property is owned by Alvinza Hayward, who can congratulate himself on having another slice of good fortune. ..... The adjoining claim, the Nevada, is being vigorously prospected. The hoisting machinery is on the ground, and will soon he put in position. The Hazard and Nevada are both under the superintendency of the well-known H. Reese, which is sufficient guarantee that the work will he ably done.

CHLORINATION.—The Bunker Hill chlorination works are running on custom ore and giving great satisfaction, the tailings frequently running down as low as 50¢ per ton. The peculiarity of these works is in using the chlorine gas under pressure, so acting quicker and more effectively. ..... The Kelly mine and mill are idle. Most of the employes were paid off last week.

BUTTE.

SPRING VALLEY.—Oroville *Mercury*, Aug. 12: I took a stroll, in company with Mr. Williams, the superintendent, and Louis Glass, secretary of the Spring Valley company, through the mine, and I found everything working like clockwork. Streams of water aggregating 3,000 inches were hurled against the side of the mountain with such force as to cause the dirt of which it is composed to crumble and cave, and then in turn to he washed through an incline down to the great tunnel lately constructed, and after flowing through which the debris is deposited in the ravine, some 2 miles below the mine. The gentlemen invited me to take a trip through the great Eureka tunnel. Stepping upon the cage we were lowered 145 ft below the surface, and stopped at the station on top of the flumes. There is a walk between the flumes that enables the workmen to travel from one end to the other, to see that the flume does not clog with the debris. From the upper end of the tunnel we could look out of the other end, and the daylight looked like a small round hole, so great is the distance. The workmen were cleaning up, and candles were lighted and placed upon the partition posts dividing the 2 flumes, and I noticed how straight they were. Looking through the length of the tunnel, the lights appeared as straight as though they were attached to a string. They were perfectly straight. The company employs vast numbers of men. At present they are making their ditches and flumes larger, so as to conduct a larger amount of water.

LITTLE CHIEF.—W. H. Rodda, an experienced miner, came up from San Francisco last Saturday, and the next day proceeded to the Little Chief mine, on the Dogtown ridge, of which he has been appointed superintendent, for the purpose of resuming work on the property. Under Mr. Rodda's supervision many improvements will he introduced, and it will not he long hefore the shaft will he carried to hedrock and the value of the gravel channel covered by the Little Chief location hccome known. The Magalia, or Dogtown ridge, is thought, by good judges, to embrace some of the richest gold-hearing gravel channels in Butte county, and all physical indications point to great extent. The Little Chief company's shaft is now down where gravel may be expected at every foot sunk, and we are certain it will not he long hefore Mr. Rodda will fathom its greatest depth, and by drifting, in a few months at the longest, thoroughly prospect the ground. It is a San Francisco incorporation, and an assessment has recently been levied for continuing the work.

THE BIG BEND TUNNEL PROJECT.—Active preliminary operations are in progress upon the Big Bend tunnel project. On Wednesday a large number of men left town to work at road-grading, several miles of which have to he done to enable freight wagons to reach the objective point near the proposed emhouchure of the adit into Dark canyon. Machinery and supplies will he placed on the ground, in readiness for the main work, as soon as the wagon roads are completed. The grades are necessarily heavy, often 2½ ft to the rod. The road will run from Yankee hill across the headwaters of Dark canyon via Knowlton's, and then descend into the gorge from the eastern divide. The great boro will be a little over 2¼ miles long, and its greatest depth heneath the surface is 1,595 ft. In size it will be either 7½x15 ft, or 12x20 ft, which has not yet been fully determined upon, though we understand Mr. McGann, the engineer in charge of the work, says the former size is sufficient, there being grade enough to cause the rapid passage of water. Major Frank McLaughlin will he here in 10 days or 2 weeks, when a more detailed line of operations will he mapped out.

GOLD DUST.—Butte *Record*, Aug. 12: A batch of gold dust, valued at $2,000, was brough to Chico from the Butte creek mines, the other day, and deposited in the Bank of Butte County. Only a few of the claims along the creek are now being worked, on account of the scarcity of water. The McIntyre claim is the only one of importance that is being operated, and a little pay gravel is being brought forth. A number of Chicoites have an interest in this claim, and are called upon at the first of every month to yield up their assessment.

THE JACKSON MINE.—Mr. T. R. R. Demick, superintendent of the Jackson hydraulic mine, on Deer creek, came up from Oakland last evening and is at the Union hotel, where a *Record* scribe had a conversation with him. The mine closed down last spring on account of a scarcity of water, and it was the intention of the owners and managers to complete the construction of the flume that had been started before operations were commenced again. The Jackson mine is owned by a party of Boston capitalists, who have sunk thousands of dollars in it without any returns worthy of mentioning. The mine is located in a canyon that is difficult to reach hy wagon, and no water can he had to work with, except in rainy seasons. A flume capable of carrying 2,000 miners' inches of water was started, but never finished. Over $160,000 was spent in its construction, and it will yet require $60,000 to complete the 3 miles of flume that are lacking. Mr. Demick said the tunnel was 700 ft in depth had been made at the mine, in which some fair gravel had been struck. Mr. Demick said that he was on his way to the mine to dispose of everything about the place, having heen instructed hy telegraph by the owners to do so. This action, he said, was on account of the recent decision in the Gold Run mining suit at Sacramento. Although the Jackson mine has always impounded its debris, still the owners do not care to place any more money in their property until the debris question in California is eternally settled. They do not care to commence operations and then he enjoined. The superintendent said that with $5,000 he would construct a dam that would hold back all the debris from the Jackson mine for the next 20 years. The Jackson mining company has always paid all claims against them, but it is not likely their mine will soon he operated.

THE SEELEY CLAIM.—Mr. Demick is largely interested in the Seeley claim, on Butte creek, and will soon commence taking out gold. This mine has paid well, and the dirt is said to he the richest in its neighborhood. It will require something over $6,000 to furnish the mine with a sufficient water supply for operations. The work of flums building will soon he commenced.

CALAVERAS.

ANOTHER CHISPA.—Calaveras *Chronicle*, Aug. 12: We were shown another splendid chispa this week, which was sold to Mr. C. Schlund, hanker and huyer of gold dust in this place. The piece was a magnificent specimen, the value of which was a little over $100. Still the $100-nuggets are found.

MARIPOSA.

THE NELSON MINE.—*Gazette*, Aug. 12: This mine, which has been long and favorably known to many here,

is situated within the corporate limits of Hornitos, a thriving town of this county. It was formerly owned by O. B. Nelson, who has taken from the mine, at various times, fabulous amounts of gold. We are knowing full well to his taking out in 2 days' time $7,500, which gold was shown to several at the time it was extracted. With the exception of a new shaft of 75 ft, and another of 90 ft, and some gouging done upon the outcrop of the vein, but little work has been done. We have seen samples of the rock taken from the bottom of the new shaft, which are rich with visible gold diffused all through the rock. The vein is from 12 to 20 inches thick at the b ttom of the shaft, and well defined. With this mine properly opened, gold in sufficient quantities will be produced to enrich its owner.

NEVADA.

GOLD FLAT EUREKA.—Nevada *Herald*, Aug. 12: The last crushing of 62 tons of rock, taken from the Gold Flat Eureka mine, paid about $43.50 per ton. The rock was far below the average of that taken from the old works. The shaft is now down 105 ft, and the work of drifting and stoping goes steadily on. It is thought that the next crushing will give a better yield, although the owners are well satisfied with the result of the last.

PLACER.

DEVELOPMENTS IN A DRIFT MINE.—Placer *Herald*, Aug. 12: From Mr. I. Trumbo, of Michigan Bluff, who made us a visit last Tuesday, we learn that the developments in the Weske mine, now run by the Muir Bros., have of late been very satisfactory. It seems that the riches heretofore extracted from this very rich mine have come from what were tributaries to the main channel. By extending the tunnel some 1,800 ft ahead of the old worke, the main channel has been struck, and it proves to be not only of very great extent, some 800 ft across, but also very rich. An air-shaft has been raised, coming out on the opposite side of the ridge in Volcano canyon, which affords excellent ventilation; a new water-wheel of immense proportions has been put in underground for pumping the water and raising the dirt from the drift levels, and in most respects the mine is in an excellent condition for working. Some further important improvements, however, are yet contemplated. The main tunnel is being straightened out, and the present old plate track is to be replaced with T-rails; new cars are to be put in and a steam engine supplied to draw them in and out of the mine. Recent developments fully warrant all these improvements, and when they are completed the Weske will be one of the best equipped drift mines in California. At present the mine is giving employment to about 130 men, which force will be increased as improvements are made and the claim further opened.

MINING ITEMS.—Placer *Argus*, Aug. 12: The Shurtleff mine, on Duncan hill, milled 16 tons of rock this week, netting $100 per ton. Mr. S. shipped below about $3,000 in specimen gold, which was taken out in the last 2 weeks. ..... The Gold Blossom mill has been running a part of this week with very satisfactory results..... The Conrad mine, on Duncan hill, is reported as making a rich strike this week. So far we have not been able to learn the facts, but would not be surprised to hear of a fine strike there at any time..... The Morning Star has very fine ore in the north drift, much of it worth $5 per pound. A new whim is being put in place to reopen one of the old shafts for prospecting. The main shaft is down nearly 300 ft, all in fine ore..... The Rocky Ridge mine is producing $30-rock, free gold. The main shaft is all in pay rock..... The Pioneer mill and Pelster mill are both kept busy on custom work.

PLUMAS.

MAGNIFICENT QUARTZ STRIKE.—Plumas *National*, Aug. 12: About a week ago a discovery was made in the Eddman mine, at Eagle gulch, which, judging from the stories which come to us regarding it, must be almost marvelous. Last season the owners of the mine, Messrs. Edman & Malmlund, struck a pay chimney which was very rich, and with an arastra took out several thousand dollars. They worked down on it as far as they could conveniently, and then suspended operations until they could tap the vein at n lower level During the last winter and spring a tunnel has been pushed forward to the ledge, striking the pay-rock about 70 ft lower than the level worked on last year, and at this point the lode is fabulously rich. We have no reliable figures, but are told that in the past 2 weeks something like $20,000 has been pounded out in a hand-mortar, and that the vein in the tunnel fairly bristles with gold. In one mass of rock and gold—or rather gold and rock—which weighs 12 lbs., there is 10 lbs. of gold. Three or four hundred dollars to the pan is nothing unusual, and from present indications an enormous yield of gold will result from the workings in the next few months. The mine was bonded, last summer, for $150,000, but the parties failed to take it, and the bond has expired. Major McLaughlin, who is operating at Big bend, examined the mine last year, and talked of purchasing it, but did not do so. We are glad that the mine was not sold, for the present owners are worthy men, and have labored for many years to open it, and it is pleasant to think that they will receive the full benefit of their perseverance and hard labor.

MONITOR ROCK.—We are in receipt of a splendid quartz specimen from the Monitor mine, on or near Soda creek, and some 8 miles south from Greenville. Mr. George Compton is superintendent of the property, and is making a splendid showing lately. A great deal of work has been performed in opening it, the main tunnel being 1,400 ft in length. It is well fitted up, a good 10-stamp mill being at work on the rich rock. The specimen sent us is fine looking ore, and shows free gold in many places. The success of the property is assured, and the owners are to be congratulated on their good fortune.

MINE SOLD.—Major Whitlock this week purchased from J. Ericson, the claim on the Deadwood channel, in Newtown district, known as the Bowers or Ericson claim. We do not know the price paid, but some town property was transferred in the trade. Some very rich pay has been taken from the claim, and there is good reason to think that it will continue to yield the "big slugs."

SIERRA.

THE MARGUERITE CO.—Sierra *Tribune*, Aug. 12: The Marguerite company is busily engaged in erecting an additional 10-stamp mill. The freshet of water, which came from the breaking of Sardine lake, washed away the company's dam and a portion of the flume. The damage will be repaired as rapidly as possible. Meantime the mill is lying idle, as the water was obtained from the broken dam.

NEW QUARTZ MILL.—A 10-stamp quartz mill is being erected on the Four Hills claim, which is located between the Sierra Buttes and Eureka Plumas. The same parties have the contract that are putting up the mill on the Rainbow mine.

SIERRA CITY.—*Mountain Messenger*, Aug. 12: The Colombo Quartz mining company, recently incorporated, has a shaft sunk 31 ft and a tunnel in 170 ft. A contract has just been let for 100 ft. They are 50 ft on the ledge, that prospects good. A 10-stamp mill will soon be put up, and also other buildings..... The Blue Gravel company is still in rim-rock with its main tunnel..... The Haskel Peak company is down 40 ft with its shaft, and expect to find bedrock 40 or 50 ft lower. Fine washed quartz gravel, better appearing than ever before. Main tunnel 1,428 ft long..... No. 9 tunnel of the Sierra Buttes Quartz mining company is in 1,400 ft in very hard rock. A mule is now to be used for bringing out the cars. With their usual indomitable energy and perseverance, this company intend to push this tunnel into the mountain, and, aided by their Burleigh drills, will in time tap one of the richest quartz ledges ever developed in Sierra..... The 1001 company is still vigorously prospecting its claim. A crosscut tunnel is being steadily pushed ahead on the old pay streak.

TRINITY.

FRENCH GULCH.—Trinity *Journal*, Aug. 12: Dr. T. Plumb was here this week attending a meeting of the directors of the Brunswick M. & M. Co. He informs us that quartz mining interests in French Gulch district are attracting much deserved attention, and that several recently-discovered mines promise to soon develop into dividend-paying properties..... Luke McDonald, superintendent of the Brunswick mine, was in town this week, and from him we learn that the tunnel is now in 120 ft. The rock is much harder than at first, but good progress is being made.

TUOLUMNE.

STRIKE.—Tuolumne *Independent*, Aug. 12: Miners have made a rich strike on the Hunter & Richards mine, at Groveland. The 5-stamp mill has resumed operations. ..... Supt. L. J. Lewis, of the Garibaldi mine, is taking the initiatory steps to erect a 30-stamp mill on the property. The present mill of 10 stamps is found to be of insufficient capacity to satisfy the supply of ore..... The Soulsby mine looks well. At the 44-ft level the vein is 1 ft wide, and in many places shows gold freely and in abundance.

BURNED.—The Garfield mill, belonging to F. Wenzel, situated on the Lynch mine, on the Main Tuolumne river, about 22 miles above Sonora, was burned to the ground on Wednesday night, Aug. 2d. Judge Lynch was stopping at the boarding house, about 1,000 ft from the mill, at the time of the fire, and knew nothing of the occurrence until next morning. Mr. Wenzel informs us that the mill, with tramway and other fixtures, were worth $13,000. Insured in the Commercial of California for $5,000, and in the Philadelphia Fire Insurance Association for $3,000, making a total of $8,000.

NEVADA.

WASHOE DISTRICT.

CALIFORNIA *Enterprise*, Aug. 13: Are cutting out a drain and retimbering the joint Con. Virginia east drift on the 2700 level. Are still extracting ore from the old croppings.

CON. VIRGINIA.—Are cutting out a drain and retimbering the joint California east drift on the 2700 level.

OPHIR.—The Mexican winze station is completed, the air-way finished and pans and blowers put in place.

MEXICAN.—The south drift on the 2700 level has been extended 30 ft, and west crosscut No. 2 has been advanced 25 ft. The joint Ophir winze station has been sufficiently enlarged, an air-way has been completed, and the pans and blowers put in place.

SIERRA NEVADA.—On the 2700 level are putting in a station on the No. 2 winze. On the 2000 level the joint Union Con. crosscut has been extended 7 ft.

UNION CON.—Stoping out ore on the 2000 level. The southeast drift has been extended 20 ft. During the week 271 tons of ore have been extracted, and 557 tons and 830 lbs sent to the mills. Bullion shipped, $15,715.78.

YELLOW JACKET.—Since the last weekly report the water in the mine has risen 4 inches, standing to-day at a point 1,856 ft below the collar of the shaft, or 1,144 ft above the 3,000 level station. At the Winters' shaft the north lateral drift on the Sagebrush level is in a distance of 150 ft from the switch. On the 2d level the south drift is in a distance of 133 ft from the switch. We continue to find spots of good ore as we go south. From the 3d and 5th levels we are extracting some ore.

BERNICE DISTRICT.

SILVER RIDGE.—*Silver State*, Aug. 12: The load of ore brought here by C. W. Gilbert from the Silver Ridge mine, recently discovered by him in Bernice district, sampled, at the Winnemucca Reduction Works, $164.90 to the ton, which is a very good result from croppings. He says there are four locations on the lead, in one of which ore assaying $1,000 to the ton has been found. Considerable ore will be extracted from the mines in the new district this fall, and shipments will be made regularly to this place. Bernice is situated about 90 miles due south of this place, and an excellent natural road down Grass valley and Pleasant valley right to the mines. Our merchants should make an effort to secure the trade of that camp, as this is the natural outlet to the Central Pacific railroad. A postoffice, named Casket, has been established at Bernice, but, as no appropriation has yet been made for carrying the mails, there is yet no communication with the place by mail.

BRISTOL DISTRICT.

GILMER SALISBURY CO.—Piocbe *Record*, Aug. 5: The work on the mines of this company, in Bristol district, is now being prosecuted with great vigor. In the Tempest mine the west drift has been run a distance of 100 ft, and the crosscut 40 ft. The drift a little over 90 ft west ago is developing handsomely, and gives promise of growing into a body of large dimensions. It is of high grade. The shaft in this mine has been sunk to the depth of about 100 ft deeper since the resumption of work on the 9th of last month, and the bottom of it continues in ore. At the Iron mine work is being steadily shoved ahead, and, from the 9th of July, a drift has been run 100 ft on the ledge. The face of the drift is ore, though of a low grade in silver, but it goes high in lead.

ESMERALDA DISTRICT.

LEWIS CON.—*Herald*, Aug. 12: Very rich rock was struck in the Lewis Con. last Wednesday, and there was an abundance of it. Every blast in the stopes discloses ore which shows free gold plentifully. There is considerable quartz on the dump, and the mine is in such a condition that a large amount of ore can be taken out when required for crushing. It is to be hoped that milling facilities may soon be obtained.

THE CORTEZ is still extracting good ore, in anticipation of the time when a mill of its own will be ready to work. The vein is large, and the last run at Humboldt mill proved it to be rich beyond a doubt.

THE owners of the Centennial are still industriously at work, and at the depth of 400 ft have a 5-ft vein of fine ore. This, in any other district, would be called a mine.

EUREKA DISTRICT.

THE TUNNEL.—*Sentinel*, Aug. 12: The Eureka tunnel is making an average daily shipment of ore of 10 tons. The ore is increasing in the ore house, and there is also a considerable quantity broken down in the drifts and ready to be raised from the lower levels. The ore body increases in quantity and quality as it is developed. A good deal of dead work is being done at present, a shaft being sunk to connect with the ore drifts. Within the next 60 days this shaft will have been completed and connections made with the ore bodies, thereby greatly facilitating the process of hoisting. A great advantage will be gained thereby; also in the improvement of the air. The debt of the company is being rapidly liquidated from the bullion receipts of ore shipped daily from the mine and from assessments. The outlook at points in the mine, to which no reference has been made in this article, is very flattering. Work is being pushed in the face of the tunnel, now in 2,054 ft, and ore channels that have been run for so long are expected to be encountered there. It is fair to calculate that the average daily net profit of the mine is nearly $400.

LEWIS DISTRICT.

THE NEW WATER DITCH.—Lewis *Herald*, Aug. 12: A flume ditch has been completed from the hoisting works of the Betty O'Neal mine to a tank above the new Highland Chief mill, for the purpose of supplying said mill with the water necessary for all its purposes. The length of the ditch or flume is about 500 rods, and will deliver the water from the mine aforesaid to a large reservoir 12x20 ft and 6 ft deep, and the flow of water will be amply sufficient for all purposes. A force of 20 men has been steadily employed upon the work.

BIG ENTERPRISE.—A shaft was started on Thursday, which may prove to this camp the veriest boon. It is a vertical shaft, and has been started at the southeast of their new mill by the Highland Chief Co. At present writing the workmen have attained a depth of 24 ft, and it is the intention to continue the work to a depth of 100 ft, and then tunnel the mountain for a distance of about 1,000 ft. This will prospect the entire range of country about the Betty O'Neal mine, comprising the mines known as the Topsy, Stella Nevada, Florence and Nebraska. The shaft is well timbered and logged, and will be first-class in all particulars. The only thing that might interfere with the progress of the undertaking would be the encountering of water. But the company has two of the largest-sized steam pumps on hand to raise it to the surface, and, as that is only 20 ft below the large boilers of the new mill, it will be convenient to furnish said boilers with water. Taking the matter all in all, we can only congratulate our town on the enterprise and pluck which has made such an enterprise even possible, and, in looking to its projector, we can only say that it is due to the Highland Chief and its manager, J. P. Courter.

WASHINGTON DISTRICT.

ORA.—Grantsville *Bonanza*, Aug. 12: From Thomas R. Murphy, who returned from Washington district on Thursday night, we learn that the mines owned by A. J. Franklin and others are looking tiptop and producing ore of a good quality. Mr. Franklin is shipping ore to Salt Lake for reduction, which returns him a handsome profit. There are several other valuable mines in this district that would well repay a judicious outlay of capital; but somehow nowadays capital prefers to speculate in wildcat mines.

WHITE PINE DISTRICT.

NEW MINING COMPANY IN HAMILTON.—White Pine *News*, Aug. 12: Our Hamilton correspondent writes us that E. N. Robinson, of New York, President of the Sweetwater Co., who is now in Hamilton, has purchased a two-third interest in the Stefford mine, on Treasure hill, the Truckee, Buttercup and other outside mines. Col. Grandelmy er has gone below to purchase the White Pine mill for the company, and they expect to be able to start it up soon. This event has put renewed hopes into the people over there, and they confidently expect better times before long. We hope their fondest anticipations may be realized.

ARIZONA.

SILVER KING.—Pinal *Drill*, Aug. 10: The Silver King (of Pinal) shipped, on the 7th inst., 4 bars, value, $6,920. A large quantity of concentrations awaits shipment.... The Lost Prize, formerly known as the Union West, has been bonded to Eastern parties, with a considerable sum paid down as a forfeit..... Thos. Wilmore and John Cole have sold one-half of the Bootheel, Cole district, to Harter and Lewis, for $1,000.

COLE DISTRICT.—Two and one-half tons of ore from the Uncle Dave, Cole district, were bought by the Silver King company this week, to mix with its ore. The price paid was $100 per ton, and the company is prepared to take more at this rate. The owners of the mine are Tom Wilmore and Tom Graves. Cole district is looking up. Important developments may be expected there shortly.

STRIKE IN CONTENTION.—Tombstone *Epitaph*, Aug. 12: There is a report afloat, said to have originated from some one connected with the Contention mine, high in authority, talking with Col. Wiggins this morning, the Colonel being the *Republican's* authority, to the effect that they have made a big strike on the 000-ft level in that mine. If this is true, it is the most important event that has occurred here for two years, if not in the history of the place. Such a strike—the ore is said to be both abundant and rich—adds to the value of the Contention property several millions of dollars; in fact, it would be impossible to even roughly estimate the value of the strike, not alone to the Contention, but to the others on the same lode and the district generally. The *Republican* will look for the confirmation of this report with the deepest interest, and its great ambition is to chronicle its truth.

COLORADO.

GUNNISON COUNTY.—Elk Mountain *Pilot*, Aug. 8: The Ploucer stamp mill turned out its second silver brick yesterday. The first one was turned out on the 2d inst., and weighed about 000 ozs. The second one weighed between 700 and 800 ozs. It is the intention of Mr. Butters to get out at least 3 bricks this size per week..... Mine work is progressing rapidly, and no time since the spring of '80 has work been so brisk in the mines. Day and night the sound of the blast is heard on all sides, and before fall we expect to be able to chronicle some startling discoveries, which is bound to lead to some good sales. Elk and Ruby basins are both improving, and the fact is well established that good veins exist in both of these localities. We speak of these basins more particularly because there has been more work done in them than in any others, but we firmly believe the adjoining basins will prove just as rich on development..... The rich vein of ruby-bearing quartz recently located by Charles Kerner and others is improving, and promises fair to become a fine property... Work on the Silver Islet mill is progressing favorably. The grading has all been finished and the mason work will be completed this week. It is expected that the mill building will be under cover by the 15th of this month. The building will be 36x66 ft, large enough to increase the capacity of the machinery at any time. Above the mill building an ore house is to be constructed, 20x40 ft, capable of holding 1,000 tons of ore. The boiler (40-horse power), stack, one set of rolls and the rock breaker are on the ground. If there is no unforeseen delay, the company will be shipping bullion in 40 days.

EQUATOR.—Georgetown *Courier*, Aug. 10: The Equator company is at present working a force of 30 men as lessees on the Equator and Pluto lodes, all of whom are in pay. Potter & Co, who are sinking on the Plato from the Equator tunnel level, have struck a vein of ore that milled 1,072 ozs. per ton.

TUNNEL.—The United tunnel, on Kelso mountain, owned by W. F. Kelso and Mr. H. F. Davis, of Galveston, is being pushed ahead steadily under contract, and is in now about 240 ft. It has just crossed the Crosscut lode, which, where intersected, is 8 ft wide.

STERLING.—The Sterling M. Co., owner of the Sterling lode, the east extension of the Florence, on Republican, resumed work on its property about two weeks ago, by commencing two crosscut tunnels, one of which will cut the lode at a depth of 60 ft, and the other at a depth of 200 ft. This lode has produced between $25,000 and $30,000 worth of rich ore..... A fine vein of very rich ore, literally full of polybasite, has been opened in the Brunswick lode, situated about 1,000 ft above the Vulcan, on Republican mountain.

DIAMOND TUNNEL.—The Diamond tunnel is now in a distance of 2,015 ft, the heading being still in country rock. An Eclipse fan was put in last week to ventilate the heading, the fresh air being brought from the Perdue shaft. The raise on No. 8 lode, now up about 30 ft, shows improvement, the ore vein being more concentrated and carries more galena..... It is reported that a strike has been made in the Clifford mine, York district, this county, of 5 ft of ruby silver and gray copper ore.

IDAHO.

WILL SHIP TO SALT LAKE.—Ketchum *Keystone*, Aug. 9: Major Kook's company have ordered sacks, and will ship the first-class ore on the dumps of the Ontario and their other Warm Spring creek properties to Salt Lake for reduction. The reason of this, we ascertain, is that Salt Lake works offer them better terms than they are able to obtain elsewhere. The extent of this season's shipment will be governed according to the transportation facilities, etc. All the mines of this company have fine showings, especially the Ontario.

THE OHIO STRIKE.—The Ohio, located on the second divide south of East Fork and about 3 miles from the main road, has been prospected during the past 2 years, and in that time considerable ore taken out, but not until last week was the main ore vein encountered. Lately a tunnel or drift was started at the foot of the ridge on the ledge of iron, and when in but a few feet, ore was struck. The drift was extended 30 ft, at which point it exposes a 3-ft ledge containing a galena vein of an average width of 1 ft. Workmen are now drifting alongside of the vein, and are in, altogether, 50 ft.

THE VIENNA MILL.—Eleven 6 and 8-mule teams passed through town this week with two boilers and a portion of the roasters for the Vienna mill. Mr. Johnson now has as large a force employed in constructing the mill as it is possible to work to advantage, and expects to have it completed by the 1st of October. This plant will undoubtedly be alike creditable to the company and the country in general.

BROMIDE MINE.—Dick Lord has the incline on the Bromide (East Fork) down to a depth of 60 ft, and is rapidly nearing a large body of ore. Until recently, his work has been through a 4-ft ledge of white quartz, streaked with galena seams of varying width, but now the ore veins and pockets are growing in size, and a few more blasts are likely to give a still greater improvement. Dick has already taken several tons of A 1 ore from the Bromide.

ANOTHER BIG FIND.—Wood River *Times*, Aug 9: Charles Bohrman, of Bellevue, was in town to-day. He reports business surprisingly fair, even good, in Bellevue, and says that the amount of money spent there is surprising, and nobody seems to know where it comes from. Last Saturday two sign-painters made a big strike of ore in Slaughterhouse gulch, about 1½ miles from Bellevue. They found a ledge of galena and gray copper 7 ft wide, that all who have seen pronounce a bigger prospect than the Minnie Moore.

MONTANA.

PHILIPSBURG ITEMS.—Butte *Miner*, Aug. 9: The following items were obtained from a gentleman who arrived in the city yesterday: General prospecting work is being advanced on the Hope, and the shaft is down about 400 ft. The ore, as extracted from the mine, runs from 60 to 70 ozs. per ton in silver. The mine is yielding 20 tons per day, which is reduced in the mill of the company. There is a very large supply of ore on hand—perhaps enough to supply the mill to its full capacity for several years. The mill has been running steadily for the past three years, stopping only two weeks within that period in order to put in a new battery..... The Salmon, owned by the Algonquin company, has a shaft down 250 ft. The first level was opened at a depth of 130 ft, and a large amount of rich ore has been stoped out from that level..... About 3,000 tons of Trout tailings from ore run through the old Northwestern mill will be reduced at an early date. The Trout has 18 men at work, and supplies the Algonquin mill with 25 or 30 tons, its full capacity, daily..... The Granite Mountain is running a tunnel to tap the vein at a depth of at least 300 ft. The ore struck on the surface is not high enough grade. This tunnel has been advanced about 300 ft and cuts a vein of good milling ore..... The Custom mill charges 40 ozs. per ton for reducing ore..... The companies disburse monthly about $13,000.

ALTA-MONTANA.—Helena *Independent*, Aug. 12: Both the Alta and Comet mines are looking better than heretofore, and the ore in the deepest points reached is richer than that found in the upper works. It is evident that the works are now run to make pay, which is of more importance to the reputation of Montana than all show and no pay..... From Mr. William Schollar, who is in charge of the Banner mine at Gregory, we learn that the pay streak is now 12 inches thick and the ore much higher in grade than that first taken out. There is a force of 10 men at work..... Messrs. Milo Courtright and Harry Richards have each bought a one-sixth interest in the Gruhstake mine, of Virginia creek, paying at the rate of $12,000 for the mine. This is undoubtedly a good property, and under the management of such well-known miners as now own it, will yield large returns for the investment made.... Homestake mine, of Proctor & Knight, has produced considerable good ore, and two runs have been made through their 5-stamp mill, one of 28 tons, which yielded $700, and one of 135 tons, which yielded 259 ozs. of good retort, not yet melted at the U. S. assay office..... From Mayor E. W. Knight, who returned yesterday from a visit to the Boston and Montana company's Gloster mine, we learn that this property is more than holding its position as one of the best in the country. Within 30 ft from the present work in the shaft, the 300 level will be started, and the pay is now 13 ft in width and richer as depth is attained. The 00-stamp mill crushes about 75 tons of ore daily, and it is estimated by Mr. Knight that there is a supply of ore in sight sufficient to keep both the mills active for at least two years, if no more new ground should be opened.

OREGON.

IRON.—Jacksonville *Times*, Aug. 12: Iron ore, in considerable quantities, has been found in the vicinity of Rock Point. J. W. Hays informs us that J. H. Pomeroy, connected with the Oswego (Clackamas county) iron manufactory, has examined it, as also the mountain on which it has been found, and pronounces the chances for the discovery of a valuable iron mine as flattering. A tunnel will probably be run soon for prospecting purposes..... Miners are preparing for winter, in some cases..... Bolt & Co. are developing their quartz mine on Steamboat..... Capt. Ankeny and W. G. Parsons, an Arizona expert, left for the north this week, to look at some mines..... Quite a number of prospectors are now in the region of Sardine creek and rummaging the country over..... The Chinese who leased the Applegate Gravel Co.'s diggings are now at work, being the only ones that are doing anything on big Applegate.

TIN.—Mr. Mullen this week showed us a specimen of tin ore, which, he informs us, has been thoroughly tested and prospects well. It was found in the vicinity of Evans creek.

MISC.—Geo. Ross informs us that his company will probably put up a quartz mill on Louse creek before long, having found good prospects there. Gradually our mining interests are coming into prominence..... Miller & Kretzer's pipe and "giant" are now on the road and expected to arrive soon. Their ditch is also nearing completion, and everything will be in readiness for extensive operations when the rainy season commences.

UTAH.

MILFORD.—Cor. Salt Lake *Tribune*, Aug. 13: By the present outlook a mineral boom is soon to take place in this county. Outside of the Horn Silver and Cave mines (which are both bonanzas in lead and silver), Beaver county has a better showing of silver-lead ores than any other county in Utah..... Star district never looked more promising than it does, and, although it carries a black eye, will in a few short months, like a Phœnix, rise from the ashes, and become what it once was, the liveliest camp in southern Utah. To-day take the mining camps of Star, Lincoln, Bradshaw and Granite, and there is no county in Utah that has as much silver-lead ores in sight as this..... The new shaft in the Kanarrah mine, South Camp, is rapidly being sunk, and ore has already been encountered..... The Talisman, in West Camp, is shipping ore to Frisco..... The Hickory mine, North Camp, has commenced a shipment to Milford..... A shipment will soon be made from the Vicksburg, in the foothills of the Star district..... The St. Mary's continues to improve.... The Mammoth mine, near Shauntie, is liable to prove a bonanza. Work still progresses with the best results..... Work on the Roosier Boy is to be resumed again. In fact, lots of claims in Star district will, on account of the rise in lead, be made to yield a large amount of lead-silver ores..... The new strike of bismuth ore in Lincoln district is a fact. The Keystone mine, which lies next to it, is owned by Judge Goodwin, of the *Tribune*, and others, contains bismuth, and assays show from 60 to 300 ounces of silver, and from $10 to $50 in gold..... Mr. Nowlan, an expert and capitalist from Montana, made a short examination of the whole district a few days ago, and was pleased to see so good a showing of the precious metals. The Cave mine, he says, is a big bonanza that is going to last for a long time. Just think of over 30 ft of solid silver ore now in sight, that will assay 65% lead, $15 in gold and 40 ounces of silver per ton, and the Lord only knows how much bigger it is. From two to three carloads of ore are being shipped every day to Frisco from this mine, and all they take out is what they are obliged to in running the workings to prospect for other deposits. This mine is a series of caves connected together, filled with ore, but, when depth is attained, will eventually prove a regular vein of ore..... The Old Lead mine, in Lincoln district, is also a bonanza, and, before being allowed to fill with water and getting tied up with a lawsuit, had over 15 ft of galena ore in sight in the bottom of the main shaft..... Milford, although not at present a bustling business place, will yet become the mining center of this county. Its situation, railroad facilities, water, etc., give it many advantages. Already the town has one complete 30-ton smelter, a 10-stamp silver mill and complete sampling works, with the railroad track at its very door. Two forwarding companies are well established here, and are receiving ores, bullion and copper matte from points as far south as Arizona.

Ancient Footprints.

The Discoveries in the Carson Quarry.

In the last number of the PRESS we referred at length to the snbject of the footprints found in the State Prison quarry, at Carson, Nevada. The following paper, deecribing the discovery, was submitted at the last meeting of the California Academy of Sciences by C. D. Gibbes and Dr. H. W. Harkness, and was resd hy the latter:

The western declivity of the Sierra Nevada has thue far proved to be a valuable field for the paleontologist in his researches into the life, history and surroundings of primitive man. That this field is of value is owing chiefly to two causes: First, the effect of volcanic action in changing the course of rivers: secondly, to the extenaive areas laid bare by mining. The plioceue rivers of this region were filled by gravel and lava, so that their waters were diverted from their original courses and were compelled to wear away new channels. Many of these channels are from 1,000 to 2,000 ft. in depth.

In these old river channels human remains have been found, which seem clesrly to eetablish the fact that man was a resident of these valleye before the volcanic overflow which filled them with lava. Beneath these monntains, the miner, as he burrows in search for gold, ie bringing to light arrow-heads, mortare, spears and other implements, and has, it is believed, in two instances at least, unearthed the bones of the men who had ueed them. Associated with these implements, or found in the gravel deposit, have heen found the fossil remains of many species of animale, including those of the rhinoceros, two mastodone, three species of the horse, the wolf, the deer and other mammals. These remains have been found in 30 different localities, and in 11 different counties in California. In trying to determine the age of these remains, we muet hear in mind that they

Antedate the Present River System

Of the Sierras. Were we able to ascertain the number of thousands of years that were required by the present rivers to cut their channels through slate and granite to the great depthe they have now attained, we would be ahle to proximately fix the time when thess denizene of the Sierra were in exietence.

The Nevada Stete prison is situated at a distance of one and one-half miles from Carson City, the capital of the State of Nevada, and three miles from the base of the Sierrae. It lies in a valley which has an elevation of 4,630 ft. ahove the sea level. This valley is flanked upon the west by the Sierrae, which rise abruptly to the hight of about 2,670 ft. above the valley. To the north it is hounded by the Washoe range, and upon the east and sonth by a somewhat elevated range of hills in the Carson desert, through which the Carson river finds ite way to what is known as "the sink of the Carson."

The prison was built about 20 years since, on the extreme point of a hill, having an elevation of about 60 ft. This hill ie formed of sandstoue, which had its origin in the detritus brought hy wind and water from the Sierras. This point wae choeen with a view to utilizing the lahor of the convicts in quarrying stone for building purposes. As a result of this quarrying, the etone has been removed from an area of ahout one and three-querters acree and to a dspth varying from 15 to 32 ft., showing the hill to he composed of layers of sandstone alternating with seams of clay. It had been known that

Animal Remains had Been Discovered

In the above-named qnarry, but no special attention seeme to have been called to the fact until the appointment of the preeent warden, William Garrard, under whoee quick intelligence, and by whose energy a systematic effort has heen made to collect and pieeerve these fosails. And, not only this, he, together with Mr. Henks, the Sheriff of Storey county, determined to have the situation carefully examined, and, to this end, they opened correspondence with the curator of our Geologicsl Museum, C. D. Gibbee.

At one of the recent meetings of the Academy, Mr. Gibbss read the correspondence, which so impressed the members that it was determined at once to visit the locality. This, Mr. Gibbee and I did, and to-night we wish to suhmit to you our report.

The formation to which allusion has been made ie celled by Clarence King, in his egological survey of the fortieth parallel, the lower quarternary. Referring to this region, he says it ie compoeed of sandstones and clays worn down from the adjecent bigh monntains, and deposited in the water and on the ehore of a lake of many hundred miles in area, that at one time extended along the eastern base of the Sierrae and in central Nevada, and having an elevation of 4,388 ft. above the sea level. Pyramid, Winnemucca and Walker lakes, and the sinks of the Csrson and Humboldt are now the lower points of this lake, which spread its waters in the Pliocene age, and which Mr, King has called Lake Lahontan

Returning now to consider our quarry, we find in the loweet strata exposed by the workmen

Numerous Fresh-water Shells,

Which, through the kindness of Professor R.E. C. Stearne, we learn are those of a museel, of the genus *Anodonta*. At an elevationof 13 ft. above these is found another strata in wbiob, in addition to the sbells of *Anodonta*, we find a species of Physa. This discovery is of additional interest from the fact that King reports that he found no fresh-water shelle in the region excepting those of *Planorbis*. It should be mentioned that the floor or area of the yard we are now studying heare evidence of having been slightly tilted at a period subsequent to its deposition.

It also givee evidence of having bsen at one time the shore of eome lake, or, perhaps, pond, local and isolated, ae its level was above that of Lske Lahontan. Presumably we stand on the ehore of this ancient pond or lake, and as we look about us we see the footprinte of a variety of animals, among which we recognize thoee of the mammoth, the deer, the wolf, those of many birds, apparently those of a horse, and, moet important of all, what seem to be the imprints of the sandaled foot of man.

There are

Six Series of the Tracks of Man.

Each of these six series is represented hy a number of footprints (from 8 to 17) in regular order, and each showing more or less plainly the imprint of a sandal. Besides this, in one of the seriee there is a marked difference in the form of the eandal.

The first of these series which we examined is to be seen emerging, as it were, from the soutbern side of the yard, and where the cliff is 15 ft. in hight above the tracks.

This series consists of 12 tracks, to which number four were subsequently added by tunneling into the rock. These tracks were evidently made in a layer of sediment of perhaps two inches in depth, for below this layer we find the compact sandstone. In each instance the mud had been raised by the pressure of the foot into a ridge whioh entirely surrounded it. This mud is only partially solidified, and is still fiskey and easily broken on exposure. Each of the imprints furnishes us with evidence, as we believe, that the feet of the one making the tracks were protected by sandals.

In no single impression, perhaps, do we find conclusive evidence of this fact; hut, when we etudy them as a whole, we find that that which is wanting in one is furnished by others which follow.

In nearly all the toe portion of the sandal ie well shown, it being as smooth as the work of a meeon, for the dietance of two or three inches. Backward from the toe we generally find the impression of the outer portion of the sandal. When studied as a whole, we can determine, with a good deal of exactness, the actual length and breadth of the sandal, which we find to be 19 inohee in length, 8 inchee at the hall of the foot, while the heel is 6 inchee in breadth. In its outline the impression follows clearly the shape of the human foot. From the great toe outward there is a really graceful curve, which draws in toward the heel; while from the great toe inward, the line is drawn toward the instep, and thence in an outward curve to the heel. In one series this curve is deeper, showing a slightly different form of sandal.

The average length of the stride is two feet three inches. The distance between the feet, or the straddle, is 18 inches.

It must be borne in mind that these footprints proceed outward from the part of the quarry the rock of which is still in place, the face standing like a wall 15 feet high.

Taking Casts of the Tracks.

It seemed very important to know if there were more footprints of the eame series still running into and under thie rock face. To determine this fact, Mr. Gerrard, who was anxious to aesiet us in every way poesible, immediately commenced a tunnel upon the line of the printe of the same eeriee, if such exieted. In this effort he was completely succeesful, bringing to view four other footprints, three of which were more perfect than those which had been previously exposed. One of the four, owing to a fault in the rock, was too obscure to be of value. Of this series we secured 12 more or less perfect casts in plaster, which are placed oefore you for inspection thls evening.

One marked feature to which we wieh to call your attention is, that in all of these tracks the toee all turn well outward, which is not, as a rule, the habit of the North American Indian. Within a few paces of the prints we have described is to be found another seriss of tracks, made by an individual who was walking in deeper mud, which clung to and closed in upon the foot. Seven or eight such are to be seen in regular order, and then the track, like the one previonsly described, is lost in the ledge toward which the eteps are tending. On the western horder of the area are four other seriss of tracks. Three of these are somewhat smaller than the ones described, while one has a sandal more curved than that of his fellows. These are also loet in the ledge, where they may he followed hy future explorations. These prints appear to he npon a floor a few inches lower than the one first described.

Returning now to our first-deecribed tracks, we find, at a distance of 10 or 12 paces, other tracks, which we euppose to have been made by a mammoth. They are in regular order, and eight in numbes, with an average stride of four feet four and a half inches. The foot is 21 inches in diameter. They were found imprinted on what ie now a pretty compact sandstone. We find no distinct traces of toee, but only a general outline of the foot. Neither did we find any distinct impreesions of the pade of the foot. Uuderneath each foot we found a thin layer of calcareous formation which rested immediately upon the sandetone. Owing to the pressure of the foot, a ridge of soft material of one or two inches was forced up and hardened around each footprint. As the direction of these tracks wae also toward the edge of the exposed ledge, we were anxious to follow them further. To thoroughly satisfy every wish of ours, Mr. Garrard immediately began to tunnel into the ledge. By this means two more tracks were fully uncovered and exposed to our view, tbns giving us 10 tracks in a line. The newly exposed tracks were found to have been made in mud so soft that a ridge had formed around each to a hight of nearly five inches, while the imprint upon the rock was like that we had previously examined. It was now made apparent that all these mammoth tracks npon the exposed portion of the floor of the quarry had been made in the same layer of soft material, and that the raised border hsd been removed by the quarrymen in the progress of their former work. Esch footprint had evidently heen filled with rain water, and the sand had been blown into and filled it. Owing to sub-percolation, the ssnd continued to adhere to the moist surface, and thus had formed a mound of sand above each footprint. After the formation of this mound, a tongue of sand had drifted out from it a short distance in a northwesterly direction, and ss this tongue of sand had been hardened into stone, it has remained as an indication that the wind which raised these mounds above the tracks had come from the south-east. It was only with much difficulty that we removed the superincumhent sand by breaking it carefully into fragments. Had we attempted to save this entire we should certainly have injured, if not have fnlly destroyed, the footprints which we were moet anxious to preserve.

After the removal of the stone ahove the cavity, the cavity was, in each instance, abont five inches in depth, and showed the impression of the side of the foot with tolerable distinctness. We did not deem it advisable, however, to take a set of casts of these, since they could not he of much service in determining the exact form of the foot.

Tracks of Birds and Animals.

Besides the above-deecribed tracks there were abundant tracks of some wading birde, as before mentioned. Theee did not seem to differ much in form and sizs from those of the eame order now living. Several quite distinct tracks of deer are also to he seen. Others, again, were found which, in size and length of stride, much resemble those of a wolf. At one point these trsoks may be traced for a distance of 20 ft., where they, also, are lost in the ledge. There are also a few poorly defined imprinte of what we believe to he a horse. Near the western limit we find clear indications of animals having wallowed and lain in the soft mud.

There have been, we believe, but two objectione thus far raised against the cleim that the imprints first described were those of man.

First, that the coloseal sizs of the sandal will be likely to cause doubt in the minds of many.

Secondly, that the space between the feet, or, as it is called, the straddle, is so marked as to create a suepicion that they were those of an animal other than man.

To the first objection, we reply that for the protection of hie feet the primitive man would naturally select the eandal. In fashioning this eandal of wood, it is reaeonahle to suppose that with his gouge of obsidian he wonld cut out a hollow to correspond to the size of his foot, leaving a raised border which might serve ae a protection to the side of his foot, as well as to the heel and toe. Its raised border would also be of great service in securing the thongs by which the sandal was attached to the foot. Some euch plan mnet, we think, have been adopted for securing the sandal, as we find no indications of holes in the bottom of the sandal through which thongs might he paesed to faeten it to the foot.

The Footprints.

Taking thie view of the csse, it eeems to be apparent that, to protect a foot of 12 or 13 inches, he would be likely to fashion a sandal of nearly, if not quite, the proportions of the one ehowu hy the impreesion.

While it must be admitted that the print of the sandaled foot is unueually large—much larger, in fact, than the hide sandale worn by the Mexican Indians, or the straw eandale of the Japanese, yet the stride is hut that of the average man of five feet ten inchee in hight.

Throughout these notes we have used the word sandal in deecribing the footprints which we are convinced were made hy man. No complete impression of the sandal is to be found in any single footprint, yet an examination of all the footprints of eeries No. 1 shows in each a part of a perfect impression of somo portion of the eandal. By uniting these several perts of that portion of each which remains perfect, there will he seen a complete impreeion of a sandal, except the heel, which remains indistinct.

This may have been caueed by the natural slipping which takes place in walking in eoft mud.

It is worthy of remark that there appears to have been a smooth surface about three-fourths of an inch in width which extended, except on the heel, entirely around the outer portion of the sandal. In all the footprints, save one, the impression of the toe of the sandal ie very distinct.

As to the etraddling gait, we need only say that in walking in muddy and slippery places we all walk with our feet further apart. And furthermore, by using suoh an unwieldy footgear as we have described, such a position of the feet would be almost a necessity. It must not be forgotten that there are five other series of footprints other than those we have particularly described.

If now it be urged that they are all the footprints of the same hiped or animal, or of some gigantic bird, then they should he of the same general form, which can plainly be seen is not the case.

As these footprints run into the ledge in several instances, should it be deemed advisable, a tunnel may he run for the purpose of obtaining other evidence relating to this subjsct. Evidently this sandstone quarry was long agee in being deposited, and during its formation generation after generation of various forms of animal life lived and died upon its changing surface, and have left the evidence of their existence in the remains still to be found imbedded in its structure.

It is still, and must ever be, a rich field replete with facts of great value to the etudent of the history of animel life upon thie planet.

Arizona Copper.

The copper mines of Arizona are heginning to attract the attention of capitalists at the Eaet, as well as those of gold, eilver and coal. Thie, in a measure, has been brought about by the continuoue and heavy shipmente of hullion from the Copper Queen mine. This is not the only mine in the Territory, by far, for within this conuty there are numeroue large and rich veins of this mineral, and all that is lacking to place them on a paying basis is capital. The owners are poor men and unable to bear the burden of expense necessary to induce capitaliets to vieit these properties, being at a considerable distence from the line of railroad. This in time will be obviated. Not only thie drawback ie felt toward copper minee, but it holde good in respect to gold and silver ledges, and we can say truly, that if the mines of Winifred, Cave Creek, Megazine and Castle Creek districts were situated 200 or 300 miles away, there would be a grand rush; mills and smelters would be erected, and the bullion output per month would he chronicled far and wide. But, becauee they are near at hand, they are seldom visited, and the poor miner lives on hope alone. What is needed to show to tho outside world that our minss are rich in mineral, and in inexhaustible quantities, is the eroction of mills and other reduction works. Let some of our wealthier citizens form a company and carry out the above suggestion.—*Arizona Gazette.*

THE MEXICAN PROSPECTOR.—A correspondent of the Loe Angeles *Herald*, in speaking of a hardy claes of prospectors which are indigenous to all the country south of here, gives the following characteristic sketch of the Mexican prospector: "He travels with a bag of pinole, and endures the hardships of the hot climate where a white man would perieh. He knows every spring and water hole in this dry country, and every gulch and hill, and the knowledge of the deserted minee he has inheritsd ae the eon of the soil. I pity the hardy white men who venture out here on a prospecting tour. Though safe to travel, they endure great hardships; they may famish or starve in a country where money can't buy provieione, and game is scarce. To-day we must leave it to the Mexican to diecover the mine, claim and hold it eccording to the lawe of the land, which is eeeily understood, and from him, if promising, huy it for a moderate sum. In this way the best mines bave been secured, but none, as yet, to my knowledge, were discovered hy an outsider, although many mines were reopened, or new diecoveries taken in hand by them from the start."

TAKEN altogether, the editor of a paper in an agriculturel district has considerably the advantage over hie confrere in a mining region. Where the one is able to collect such subetantial articles ae butter, eggs, vegeteblee, wheat and hogs in lieu of cash, the latter seldom can ohtain anything more tangible than an interest in a mining claim, which, in 9 cesee out of 10, is equivalent to the preseut of a white elephant. —*Placer Times.*

THE Butte *Inter-Mountain* says: "The experiments of Superintendent Hall, of the Alice company, have demonstrated that one ton of coal ie equal to about one and three-fourths cords of wood." According to this statement the company are saving the difference between $14, the price of one and three-fourthe cords of wood at $8 per cord, and the price of coal at $8 per ton.

A STACK OF BULLION.—The Granteville *Bonanza* says: Frank McMahon, who hae just returned from Downeyville, informe ue that the new strike in the leading mine there ie looking immense, the ore so far encountered being of a very high grade. There are 1,100 bare of bullion on the dump at the furnace waiting shipment, which are valued at over $21,000.

THE Denver *Tribune* eays: "In the easteru traneept, Utah intends exhibiting the silver output of the Ontario mine, of the Uintah mining district. It will make a brick about 19 ft. long, 9½ ft. wide and 4 ft. 9½ inchee high. It represents a silver valuation of over $11,000,000."

THE Horn Silver mining company has aunounced ite sixth (quarterly) dividend, payable on the 15th of August, one of 75 cents a share, aggregating $300,000. Total of six dividends, $1,400,000.

Lake Valley Laid in the Shade.

For over a year now, tho New Mexican papers, as also some of the leading Eastern journals, bave been blowing about the unparalleled richness of the Lake Valley mines, of which the late George Daily was superintendent, and who, in his ever memorable report, said that "even the weeds growing over the mine give large assays in silver." Not content with a subservient press, the ubiquitous manipulators of these stocks have, upon frequent occasions, pressed the wires of the associated press into their service to give them prominence. Notwithstanding all this blowing, all the bullion thus far reported is $49,000, so small an amount that it would cut but a sorry figure in the bullion reports from Tombstone district.

Less than one year ago, there was discovered a mining district in Cochise county, not 50 miles from Tombstone, of which but little has thus far been said, that to-day eclipses any similar discovery on the Pacific coast, if not on the American continent. This is the Winchester district, near the Point of Mountains on the old Silver City road. Messrs. P. W. Smith and H. Solomon were the first capitalists to examine these mines and invest money in them. They interested George Hearst with them, since when a large amount of work has been done upon their purchase.

Upon all occasions they have discouraged any notoriety being given their property; but the thing has gone that far that to longer refrain from telling what they have, is to do a gross injustice to the people of this Territory. One fact will show how enormously rich this property is. Since and including the 8th day of July up to and including the 29th, being just 21 days, five men took out and placed upon the dump ore of the value of $30,000 by careful bucket sample assays. This ore came out in the legitimate work of prospecting. They are now sinking through a solid body of black sulphuret ore 12 ft. wide. The ledge has been crosscut in numerous places, everywhere showing rich chloride and horn-silver ore. Mr. Lazard, the new and efficient superintendent, pronounces this one of the finest properties he ever saw, and he has had large experience in working mines. As a mining field Cochise county offers better opportunities than elsewhere in America.—*Tombstone Republican.*

Seven-Thirty.

From the Colorado *Miner* we take the following:

This property, situated about four miles from Georgetown, embraces 12 separate patented claims crossing Brown gulch nearly at right angles, and covering over one mile in length of the principal vein, and embracing a surface area of .33 and .73 acres.

This group of mines was discovered 15 years ago, and work commenced upon them soon after, and developments have been carried on continuously, each succeeding year adding to the depth and distance along the vein explored, until today we find in this mine over a mile of drifts, driven into solid granite and porphyry, laid with a T-rail track throughout, and supplied with iron or wooden cars.

The principal work is done through the Hercules tunnel, which is a crosscut striking the vein 125 ft. in, and at about 100 ft. below the surface. This connects with the tunnel level, 1,100 ft. in length, which is being continued east and west, and is gaining great depth each way. Seven hundred feet farther west will give it 1,100 ft. below the surface, and a like distance east 900 ft., the ground rising rapidly on each side of the gulch.

It is difficult to obtain anything like an accurate estimate of the ore which these mines, still in their infancy as regards depth and lateral development, have produced, but for the purpose of examining the grade of the ore, Mr. H. M. Griffin, the fortunate owner, showed us a bundle of mill runs which footed up the snug little sum of $329,628.90.

Some 50 men are at work on the property; but should Mr. Griffin carry out his intention of putting up hoisting machinery capable of sinking the main shaft to connect with the Silver Ore tunnel, a depth of 1,300 ft., a total depth of 2,400 ft. would then be open for stoping, and none of our readers would be likely to live to see such reserves exhausted.

It may be very safely predicted that only powerful machinery is needed to convert these mines into a veritable bonanza. Excellent buildings have been already erected, and a good wagon road constructed to the mouth of the tunnel, and the mine throughout maintained in the most complete working order.

Gold.—We have, on several occasions, published in regard to a gold ledge being unearthed in the First Chance prospect, at Stampede Gap. Owing to there being some conflict of title to a portion of the ground with another claim, in which Sol Brisacher and Ike Garrison were interested, no work was done on the claim. As the specimens taken from the First Chance resembled the gold ore of the Black bills, it was reported the ore had been sent to Pioche from that country. On Thursday a number interested in both claims went out to Stampede, and in the evening returned, Brisacher bringing back with him several pieces of rock, in which gold could be seen with the naked eye, that be had taken from out the ledge himself. It is likely that the two claims will be consolidated, thus settling all disputes which might arise, and work done on the claim.—*Pioche Record.*

Useful Information.

Cold Soldering.

Various nostrums have been proposed from time to time, which profess to be reliable methods of soldering without heat; but when tried, they have generally proved useless. The following recipe, published in the *English Mechanic*, is from Mr. Fletcher, of Warrington, well known for his gas furnaces and other apparatus, and it will probably be found to be trustworthy.

It must be borne in mind that, though the first preparation is tedious, a large quantity of the material can be made at once, and the actual soldering process is as simple and quick as it well can be.

Flux: One part metallic sodium to 50 or 60 parts mercury. (These combine on being well shaken in a bottle. If this is too much trouble, the sodium amalgam can be bought, ready made, from any chemist or dealer in reagents.)

The sodium amalgam must be kept in a stoppered bottle, closed from the air. It has the property of amalgamating (equivalent to tinning by heat) any metallic surface, cast iron included.

Solder: Make a weak solution of sulphate of copper, about one ounce to one quart of water. Precipitate the copper by rods of zinc; wash the precipitate two or three times with hot water; drain the water off, and add for every three ounces of precipitate six or seven ounces of mercury; add also a little sulphuric acid, to assist the combination of the two metals. When combined, they form a paste which sets intensely hard in a few hours, and this paste should be made, whilst soft, into small pellets.

When wanted for use, heat one or more of the pellets until the mercury oozes out from the surface in small beads; shake or wipe them off, and rub the pellet into a soft paste with a small mortar and pestle, or by any other convenient means, until it is as smooth and soft as painter's white lead. This, when put on a surface previously amalgamated by the sodium and mercury, adheres firmly, and sets perfectly hard in about three hours. The joint can be parted, if necessary, either by a hammer and cold chisel, or by a heat about sufficient to melt plumber's solder.

The Motion of Bombshells.—At night we can see the path of a shell through all its journey, lighted as it is by the burning fuse. When the range is two miles, the track of a shell from a mortar describes very near half the area of a circle. On leaving the mortar, it gracefully moves on, climbing up and up into the heavens till it is nearly or quite a mile above the earth, and then it glides along for a moment, apparently in a horizontal line; but quickly you see that the little fiery orb is describing the other segment of the circle. A shell from a Parrot rifled gun, in going two and one-half miles, deviates from a straight line not quite as much as a shell from a mortar; but in passing over this space considerable time is required. The report travels much faster than the shot. A shell from a mortar will make a distance of two miles in about 30 seconds, and from a Parrot gun in about half that time. The flash of a gun at night, and the white smoke by day, indicate the moment of the discharge, and 15 or 20 seconde give an abundance of time to find a cover in a splinter proof, behind a trench, or something else.

Glycerine and Glue.—A German chemist named Pusher, a native of Nuremberg, reported to the trades union of that place, that he met with great success in using glycerine together with glue. While generally, after the drying of the glue, the thing to which it is applied is liable to break, tear or spring off, if a quantity of glycerine equal to a quarter of the quantity of glue be mixed together, that defect will entirely disappear. Pusher also made use of this glue for lining leather, making globe frames, and for smoothing parchment and chalk paper. He also used it for polishing, mixing wax with the glycerine, and using it as an underground for laying on aniline red color. The red was found to exceed all others in which glycerine is not used. The glycerine has also some properties in common with india-rubber, for it will blot out pencil marks from paper, so as to leave no mark whatever. A paste made of starch, glycerine and gypsum will maintain its plasticity and adhesiveness longer than any other cement, and does, therefore, recommend itself for cementing chemical instruments and apparatus used by pharmacists.

Glass Veneers.—Boston has an invention of what is known as glass veneers. Underneath a plate of glass is a substance made in exact imitation of the grain of wood—oak, mahogany, rosewood, maple, etc.—and the whole attached to the article of furniture, either as a panel top or otherwise. The effect thus produced is beautiful in the extreme, surpassing any polish of the natural wood that it is possible to produce. But perhaps one of the most important features attending the glass veneers is the great variety of uses to which they are applicable. For paneling, dado work, top of center or side tables, mantels, office furniture and even doors, the glass veneers are most admirably adapted. Among other articles, a small round table veneered in imitation of a costly variegated marble was beautiful in the extreme.

Explosion of a Billiard Ball.—Recently, says the Evansville, Penn., *Journal*, as a colored man was cleaning up in Hick's billiard saloon, he was startled by a loud report, as if a musket had been discharged in the room. The report was followed by the falling of small pieces of ivory (?) all over the room. An examination revealed the fact that one of the billiard balls had exploded and broken into fragments. It was in the billiard rack, and no one near it. Several gentlemen were called in, among whom was the agent of composition pool and billiard balls. He said he never before heard of such an occurrence. For fully five minutes after the explosion the room was pervaded with a strong smell of camphor. The use of camphor, it will be recollected, is largely employed in the manufacture of composition billiard balls.

Electricity in China Ware Manufacture.—A beginning has recently been made with the utilization of electricity for clearing China paste prior to baking it. It is a known thing that there are oftentimes black specks on the surface of china ware, which greatly take off from its value, sometimes as much as 40%. Of course, it is in the manufacturer's interest to obviate this drawback. The specks alluded to arise from the presence of diminutive particles of iron, and these, it has now been found, can be removed with a magnet. Two large French manufactories have already been fitted up for that purpose. On an average, the electro-magnetic machines used extract from seven to eight lbs. of iron from 100,000 lbs. of china earth that are submitted to them.

Sealing for Corks.—M. Potel has lately introduced a new compound for sealing over corks, and for molding various ornaments, etc. It is made by soaking gelatine in water for a short time, and then dissolving it in glycerine, the former being in excess; to half the amount of glycerine thus used some tannic acid is added, and solutions aided by the heat of a water bath; these solution are then mixed, when the compound is ready for use. Any desired coloring matter may be added, and if required for the fabrication of any small article, sulphate of barium. Pittinson's white (chiefly a hydrated oxychloride of lead) or white lead, may be worked in it until the correct color and texture is arrived at.

No Lead or Zinc in Ancient Bronzes.—From analyses made by M. E. Reyer, it seems that the bronzes used for weapons by the ancients contained no lead or zinc, but were alloys of copper and tin with small quantities of nickel, iron, phosphorus and occasionally cobalt.

Good Health.

The Allopatho-Homœopathic Muddle.

The discussion of the question whether or not allopathic physicians shall be permitted to consult with legally qualified practitioners of other schools has been brought into such prominence by the action of the American Medical Association, in excluding the New York delegation, which favors such consultation whenever deemed expedient, that we are inclined to make a note anent it. So far as we can see, per our readings in the many medical periodicals which come to us among our exchanges, the most dust is kicked up by the allopathists; the part taken by the gentlemen and ladies who list themselves under other scholastic titles being in the main passive. In allusion to this, the New York *Tribune* remarks that, "among the most disinterested spectators of this trouble in the 'regular' ranks will be found the homœopathists themselves. They think they are in a position to ask no favors."

We readily believe this, having some knowledge of the growth of homœopathy in the United States, and its apparent readiness to meet the older system by comparison of statistics, or otherwise. We believe, also, that the eclectics and the hygienists are also in a similar position of independence. The attitude of most eminent physicians of assured income is, we think, independent of society or association rulings; several we know personally claiming the right to decide for themselves the propriety of their course in the matters of treatment and consultation. We cannot but respect such men more than those who submit to be bound by an iron code, or pent up behind a barrier of class exclusiveness. Somebody might ask, however, "Has not a given organization of scientific men the right to make such rules as the majority wills for their individual governance in professional practice?" Hardly, we must answer, for if such practice relates to the public at large, the sentiment of the public should be considered, not their own private sentiments as individuals or a society. A physician is not a ruler or a master; he is rather a minister, or something of a public servant in a department of high importance, and it is essential to the best performance of his duties that he have much latitude of action.—*Phrenological Journal.*

Lemon Juice.—Prof. Schmale, an eminent pathologist in Bonn, Germany, recommends persons who wish to live to old age to swallow the juice of from six to eight lemons daily. The citric acid, he thinks, will dissolve and carry off the surplus of food and decaying matter quickly, and preserve health almost indefinitely. One man who tried it lived to be 110 years old. Who will follow his example?

Egypt in August.

"Egypt is as deadly in August as India in June," say old travelers; and this sinister reputation is only too well deserved. The same distempers which almost destroyed the army of Louis IX of France, at Damietta, in the 13th century, decimated the troops of Bonaparte and those of his successors, Kleber and Menou, at Alexandria, in the end of the 18th. Indeed, those who have been in lower Egypt during the unhealthy season may well wonder, not that so many should succumb to the climate, but that any one should escape. The dreadful "khamsin," or hot wind, which the strongest man cannot face without instantly feeling his muscles unstrung, his skin parched and feverish, and his whole body limp and nerveless as a wet rag, is of itself a sufficient agent of evil. The fevers engendered by the malaria of the Nile delta are as virulent as even those of European Turkey, while the devastating visits of the plague itself are neither few nor far between. A less fatal, but equally formidable enemy to an invading army is the terrible "Egyptian ophthalmia," which, although often brought on by the unclean habits of the natives, is at times generated in another and a very singular fashion. A small green fly persistently settles upon the sores of the diseased eyelid, and, when driven off, carries the infection along with it wherever it alights. So common is this disease among the Arabs, that Mehemet Ali is said to have formed two battalions of one-eyed men, the one wanting the right eye and the other the left. In 1798 this complaint made great ravages in the army of Bonaparte, one of whose best officers, becoming blind in the desert, was forced to cling to the tail of a comrade's horse in order to make his way back to the camp. It is a common saying in Alexandria that "an Egyptian Arab with two eyes is as rare as a snowball in June."—*New York Times.*

Malarial Foundations.

The San Francisco *Bulletin*, some time since, commenting upon some of the foundations in existance in this city, makes the following statements: Many of our business houses, and nearly the entire residence portion of our city, are composed of wooden structures built on foundations of similar material. In a few years, floors begin to settle, cracks appear in walls, and owners, becoming alarmed, consult their architects, who, upon examination, pronounce the foundations as rotting, and entirely unsafe in upholding the superstructure. Then trouble begins. The underpinnings have to be taken out and brick supports placed in proper position. A correspondent who has given some attention to the subject informs us that recent scientific investigation developed the fact that the wood used for foundation purposes becomes decayed by contact with the sand, which destroys its fiber, leaving it porous, brittle and of no value. A fungus growth starts from the edge of the decaying wood, and is composed of myriads of infinitesimal insect life, which burrows and honeycombs the remaining wood until its vitality is gone, and the insect itself yields up its life in the wreck of matter. This decaying mass creates a vast deal of malaria, and physicians trace many of the noxious odors and fever-breeding troubles to the festering condition of the underground portion of residences. It has been proved beyond question that when proper foundations are placed beneath such structures, the malarial atmosphere largely ceases to exist, while the occupants are relieved of certain feverish attacks, previously frequent. To parties intending building, this matter is of much importance, and it is suggested that true economy would warrant the increased expense of a brick foundation over that of a wooden one. Nearly all buildings of any value are now being erected on brick foundations, and it is presumable that only the cheapest kind of dwellings will be placed on any other basis.

Buttermilk as Summer Food, Drink and Medicine.—A recent writer asserts that for a hot weather drink, nothing equals buttermilk. It is, he says, "both drink and food, and for the laborer is the best known. It supports the system, and even in fever will cool the stomach admirably. It is also a most valuable domestic remedy. It will cure dysentery as well as and more quickly than any other remedy known. Dysentery is really a constipation, and is the opposite of diarrhœa. It is inflammation of the bowels, with congestion of the 'portal circulation'—the circulation of blood through the bowels and liver. It is a disease always prevalent in the summer and autumn. From considerable observation, I feel warranted in saying that buttermilk, drunk moderately, will cure every case of it; certainly when taken in the early stages."

Diphtheria and Filth.—It has recently been shown that of the total number of cases of diphtheria reported in New York—1,706—some 1,405 existed where the premises were in a bad sanitary condition, and that 1,342 occurred where the drainage was defective, and filthy cellars, filthy cesspools and overflowed vaults existed. In other words, of the houses in which these cases occurred, 82% were found to be in a defective sanitary condition. This tells the story of the cause of diphtheria, in Boston, at least.

TABLE OF CONTENTS.

EDITORIALS—Miners' Relief Funds; The Improved Rock Drill; Chances of Finding Mines, 113. Passing Events; Death of Guido Kustel, 120. Advance in Discoveries and Inventions, 120-21. The Denver Exposition—No. 1; Fans for Mine Ventilation, 121. Patents and Inventions; Notices of Recent Patents, 124.

ILLUSTRATIONS—Ingersoll Rock Drill on Single Carriage, 113. Mine Ventilating Fans, 120.

CORRESPONDENCE.—Fresno Flats Mines, 114.

MECHANICAL PROGRESS.—No Limit to the Demand for Machinery; On Cracks and Annealing of Steel; Welding by Pressure; The Hardening of Vulcanized India Rubber, 115.

SCIENTIFIC PROGRESS.—Has the Moon an Atmosphere? Shortness of Time in Dreams; Discovery of Mont Blanc; A Galvanometer for Electric Light Currents; The Determination of Sulphur in Pyrites; Mixture of Gases by Diffusion, 115.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends, 116.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, Oregon and Utah, 116-117.

USEFUL INFORMATION.—Cold Soldering; The Motion of Bombshells; Glycerine and Glue; Glass Veneers; Explosion of a Billiard Ball; Electricity in China Ware Manufacture; Sealing for Corks, 119.

GOOD HEALTH.—The Allopatho-Homœopathic Muddle; Egypt in August; Malarial Foundations, 118.

MISCELLANEOUS.—The Nichols Bonanza; Idaho's Advancement; Purification of Precipitated Copper; Quartz Mining in Idaho; Calico Mountain; Mine Management; Flameless Combustion, 114. Ancient Footprints; Arizona Copper, 118. Lake Valley Laid in the Shade; Seven-Thirty, 119.

NEWS IN BRIEF—On Page 124 and other pages.

Business Announcements.

Ingersoll Rock Drills and Air Compressors, Berry & Place Machine Co., San Francisco.

Notice to the Public—Parke & Lacy, S. F.

International Exhibition at Amsterdam, in 1883.

Delinquent Sale—Thor and Bright Point M. Co.

Passing Events.

A local event of importance this week was the formal opening of the Mechanics' Institute exhibition at its new building, which we described in the last number of the PRESS. We give a portion of the opening address in another column.

We give, also, the first of a series of letters from the Denver Mining exposition from W. B. Ewer, Commissioner from California, and one of the proprietors of this journal.

Of mining news there is not much to note. The strike in Contention, at Tombstone, is looked upon hopefully by the people of that camp. A fine strike in quartz has been made in the Edman mine, Eagle gulch, Plumas county. The new vertical shaft of the High-and Chief, in Lewis district, is expected to prospect ground that will prove of value to the camp. Another rich strike is noted a few miles from Bellevue, Wood River.

The Excelsior Water Company, at Smartsville, owned by Boston capitalists, has been closed down, in obedience to an injunction issued by the Superior Court of Yuba county, restraining them from washing gravel or selling water for that purpose. This company was complying with Judge Temple's decision, and making extensive preparations to impound their debris. Several hundred men are thrown out of employment. Hydraulic mining is the only industry of this section, and supports a population of nearly 2,000 people. The product of the Smartsville mines for the past 20 years has been nearly $20,000,000.

UTAH sent 10,000 copies of a pamphlet on the "Resources and Attractions of Utah," to the Denver exposition.

Death of Guido Kustel.

Guido Kustel, the well-known mining engineer and metallurgist, died at his home in Alameda, on Wednesday last, after an illness of a few weeks' duration, of inflammation of the kidneys. Probably no mining engineer on the coast was better known than Mr. Kustel, he being one of the few willing to publish their experience for the benefit of others.

Mr. Kustel was born in Galecia, Austria, and was educated at Freiberg, Saxony. There he had every advantage of the technical schools, and early evinced a decided love for what became his life pursuit. He came to California in 1851, and went through all the life of a pioneer in the mining regions. When the Washoe excitement broke out he went to Nevada, and was among the first to work the silver ores, concerning which little was known here at that time. He started amalgamation works there on the Tyrolean tub-amalgamation principle, the pan amalgamation coming up afterwards. He introduced the roasting and barrel-amalgamation process at the Ophir works, and was for a long time connected with the metallurgical progress of that region.

In 1863 Mr. Kustel published his work on "Processes of Gold and Silver Extraction," which created a sensation here, as it was just what we wanted at the time.

His next work was on "Concentration and Chlorination," which was published in 1868, by Dewey & Co., publishers of the MINING AND SCIENTIFIC PRESS.

In 1870 he submitted to the public his "Roasting of Gold and Silver Ores," also published by Dewey & Co, and of which a new edition was printed in 1880.

With Mr. Ottokar Hoffman, his nephew, he experimented with the lixiviation of ores in 1867-68, and Mr. Hoffman shortly after went to Mexico to erect works for the process. Mr. Kustel was quite an inventor, and obtained several patents from the Government. One of these was on a process, one on an amalgamator, and one on a concentrator. He discovered a new mineral, a combination of lead and gold, found on the Comstock lode, and very rare indeed. It was enbmitted to Prof. Breithaupt, the eminent mineralogist, who described it, and complimented the discoverer by naming it *Kustellite*.

Mr. Kustel's method of blowpipe assay for quicksilver is recognized as the simplest and best, and is printed in all European works.

As a metallurgist, Mr. Kustel's reputation was very high everywhere. He was known in every mining camp on the coast, and was universally respected. In very many places he was called on to start up works where the people had any difficulty with their ores. He would test the matter, apply the remedy, and return, never putting himself forward in any way.

His modesty always stood in the way of his advancement. His studious habits and retiring disposition were not aids to the pursuit of riches. He was an energetic worker, taking pleasure in his work and doing whatever he did with the most methodical manner and the greatest care.

Mr. Kustel has done more or less in the examination of mines all his life, but applied himself more particularly to metallurgy. He was connected with several Mexican mines at different times.

His published works did a great deal of good. They were written in a simple, plain manner, so as to be readily understood. The whole coast has profited by his labor. He was a frequent contributor to the press on technical subjects, and the columns of the MINING AND SCIENTIFIC PRESS have been enriched by many articles from his pen.

For some years he has been conducting an office for assaying and working ores in this city, latterly with his only son as partner. He was a good chemist and mineralogist, and his loss will be greatly felt by the mining public. He was 65 years of age at the time of his death. Mr. Kustel was pre-eminently truthful, and his integrity was never questioned.

THE Alta-Montana Co.'s mine, at Wickes, Montana, produces about six carloads of base bullion a month, netting nearly $50,000 a month, according to the Helena *Independent*. Since the new management at the Alta-Montana Co.'s reduction works came into power, things wear a decidedly improved aspect. It is safe to say that at least $10,000 per month has been saved to the company of useless ontlay, while the daily product of bullion is not in the least degree diminished. The deliveries from the Alta mine on Thursday, August 3d, amounted to 60,000 lbs. of ore, and from the Comet, 20,000 lbs., besides 10,000 lbs. of calc spar, which now supersedes the use of limestone. This spar contains over 50% of pure lime, and over 40% of carbonic acid, and is free from silica and other deleterious ingredients. The carbonic acid is almost as useful an agent in the furnace as the lime, and this pure article now taken from the Comet is costing the company less than five dollars per ton, whereas the lime rock formerly used cost the company considerably more than double that amount.

THE Cottonwoods are turning out more ore than in any year for a long time, and American Fork is also doing well. Bingham keeps up a steady production.

Advance in Discoveries and Inventions.

Address of Hon. Chancellor Hartson at Opening of Mechanics' Institute Exhibition.

From the scholarly address of Hon. Chancellor Hartson, delivered at the opening exercises of the Seventeenth Industrial Exhibition of the Mechanics' Institute, August 15, 1882, we take the following extracts:

The relations between science and the mechanic arts may be compared to the relations between the mind and the body, between steam and the steam engine, or between electricity and the electrical apparatus—both being indispensable for the accomplishment of any useful purpose.

Science and the mechanic arts are so intimately connected and so mutually dependent that they will be treated as identical in purpose and results, and as mutually contributing to the world's development and progress from the earliest ages of recorded time down to the present period.
